As to the other "fundamental defect," as Dr Burn styles the leaving the management of the poor to overseers, the position of overseers and their action are so admirably painted, and the description so applicable to the mode of administration down to the reform of 1834, that the observations, written in a happy strain of irony, must be inserted.

"As to overseers of the poor, it is true the law provides that they shall be substantial householders. But many a man may be a substantial householder who is not fit to be an overseer of the poor. And in fact the office goes by rotation from one householder to another,—some perhaps tenants at rack rent, whose lease expires the next year, others ignorant and unexperienced, others not willing to charge themselves to disoblige their neighbours; and all of them wanting to get over the office with as little trouble to themselves as possible; and if any, wiser than the rest, projects anything for the common good his office expires at the end of the year and his labour is frustrated, and in practice the office of an overseer of the poor seems to be understood to be this:—To keep an extraordinary look-out to prevent persons coming to inhabit without certificates, and to fly to the justices to remove them; and if a man brings a certificate then to caution all the inhabitants not to

let him a farm of £10 a year, and to take care to keep him out of all parish offices; to warn them, if they will hire servants, to hire them half-yearly or by the month, by the week or by the day, rather than by any way that shall give them a settlement, or if they do hire them for a year then to endeavour to pick a quarrel with them before the year's end, and so to get rid of them. To maintain their poor as cheap as possibly they can; at all events not to lay out two-pence in prospect of any future good, but only to serve the present necessity; to bargain with some sturdy person to take them by the lump, who yet is not intended to take them, but to hang over them *in terrorem* if they shall complain to the justices for want of maintenance. To send others out into the country a begging (for why cannot they go as well as others they will mention, who are less able in body?) and the feebler they are the more profitable will be their peregrination. To bind out poor children apprentices, no matter to whom or to what trade, but to take especial care that the master live in another parish. To move heaven and earth if any dispute happens about a settlement, and in that particular to invert the general rule, and stick at no expense. To pull down cottages. To drive out as many inhabitants and admit as few as possibly they can; that is, to depopulate the parish in order to lessen the poor rate. To be generous, indeed, sometimes, in giving a portion with the mother of a bastard child to the reputed father, on the condition that he will marry her; or with a poor widow (for why should she be deprived of the comforts of matrimony?)—always provided that the husband is settled elsewhere. Or if a poor man with a large family appears to be industrious they will charitably assist him in taking a farm in some neighbouring parish, and give him £10 to pay his first year's rent with; and if any of their poor has a mercantile genius they will purchase for him a box, with pins, needles, laces, buckles, and such like wares, and send him abroad in the quality of a petty chapman, with the profits whereof, and a moderate knack of stealing, he can decently support himself, and educate his children in the same industrious way. But to see that the poor shall resort to church, and bring their children there to be instructed; to contract with a master that he shall procure his apprentice at proper times to be taught to read and write; to provide a stock of materials to set the poor on work, to see the aged and impotent comfortably sustained, the sick healed, and all of them clothed with neatness and decency,—these and such like it is to be feared are not so generally regarded as the laws intended and the necessity of the case requires."

Dr Burn's remedy was not to abolish overseers altogether, but that, while they or a permanent overseer should collect the rate, a general superintendent over a certain number of parishes should be appointed by the justices at sessions, and the disposal of the rate directed accordingly.

How far the criticism and suggestions made, from those of Sir Matthew Hale downwards from time to time, influenced the legislation already indicated of the 18th century and the early part of the 19th, it is impracticable to discover. One thing is certain, that evils grew apace: ratepayers on the one hand, the poor on the other, political economists and philanthropists, magistrates and jurists, and observers of every kind were dissatisfied. For the general state of the poor in the beginning of the 19th century as presented to the accurately observant eye and ear of our English Juvenal, we glean more from his *Borough* than from a pile of statistics. Of the poor who were chargeable to the parish Crabbe says:—

"To the most we give
A weekly dole, and at their homes they live."

Of the workhouse or house of industry, "the pauper palace which they hate to see," he speaks mournfully. In prose he wrote of the poor who "must be considered in every place as a large and interesting portion of its inhabitants," condemning the workhouse system, alike the pauper palace and the house rented for the poor,—the

"House that holds the parish poor,
Whose walls of mud scarce bear the broken door."

A closer examination of the system of maintaining the poor than could be obtained by casual visitors, or even constant residents having no special duty to examine or inquire, showed, in full accord with the public criticism already examined, and in spite of it, that the fund which the famous statute of Elizabeth directed to be employed in setting to work children and persons capable of labour, but using no daily trade, and in the necessary relief of

Enumeration
and classifica-
tion of
evils.

the impotent, was by degrees applied to purposes opposed to the letter and still more to the spirit of that law, and destructive to the morals of the most numerous class and to the welfare of all. The great source of abuse was the relief afforded out of the workhouse to able-bodied persons,—a class never intended by the legislation as fit objects. The description of relief was also very objectionable. Its most usual form was that of relieving the applicants either wholly or partially from the expense of obtaining house room. Partial relief from that expense was given or professed to be given by exempting the occupants of a cottage or apartment from the payment of rates on the ground of poverty, and in a great number of cases by paying the rent out of the parish fund. Relief afforded in money to the able-bodied on their own account or on that of their families was still more prevalent. This was generally effected by one of the five following expedients:—(1) relief without labour, (2) the allowance system, (3) the roundsmen system, (4) parish employment, (5) the labour-rate system. (1) The relief without labour was by the parish giving to those who were or who professed to be without employment a daily or weekly sum, without requiring from the applicant any labour. (2) "Allowance" sometimes comprehended all parochial relief afforded to those who were employed by individuals at the average rate of wages of the district, and was sometimes confined to the relief which a person so employed obtained on account of his children, in that case any relief obtained on his own account being termed "payment of wages out of rates." In some places allowance was given only occasionally or to meet occasional wants, for instance, to buy clothing or food or to pay the rent of a cottage or apartment. Sometimes the income of the poor was regulated by the name of "scales"—giving in money the price of so many loaves of bread or of a specific measure of flour, according to the number of the family. (3) The roundsman (or, as it was sometimes termed, the billet, or ticket, or item) system was the parish paying the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish, and depending, not on the services, but on the wants of the applicants, the employer being repaid out of the poor rate all that he advanced in wages beyond a certain sum. According to this plan the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, paying to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of his family, awarded to him. It received the local name of billet or ticket system from the ticket signed by the overseer which the pauper in general carried to the farmer as a warrant for his being employed, and afterwards took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with a person to have some work performed for him by the paupers, at a given price, the parish paying the paupers. In many places the roundsman system was carried out by means of an auction, all the unemployed men being put up to sale periodically, sometimes monthly or weekly, at prices varying according to the time of year, the old and infirm selling for less than the able-bodied. (4) As for parish employment, although work is made by the statute of Elizabeth a condition precedent to relief otherwise than in the case of the impotent, and it is a duty of the parish officers to provide it, payment by them for work was the most unusual form in which relief was administered. Scarcely more than one-twentieth part of the sum yearly expended for the relief of the poor at the period immediately preceding the inquiry that led to the amendment of the law in 1834 was paid for work, including work on the roads and in the workhouses.

This was easily accounted for "by many causes, including the trouble and difficulty attendant upon superintendence on the part of parish officers." (5) An agreement among the ratepayers that each of them should employ and pay out of his own money a certain number of the labourers settled in the parish, in proportion not to his real demand for labour but to his rental or to his contribution to the rates, or to the number of horses that he kept for tillage, or to the number of acres that he occupied, or to some other fixed standard, has been denominated the labour-rate system. This system was generally enforced by an additional voluntary rate on those who did not employ their full proportion.

As illustrating the difficulties attendant upon providing for the poor, a temporary Act passed in 1832, which has disappeared from the statute book (as founded on vicious notions), may be noticed, applying to parishes where the poor rates exceeded 5d. in the pound. It recited that, notwithstanding the many laws in force for the relief and employment of the poor, many able-bodied labourers are frequently entirely destitute of work or unprofitably employed, and in many instances receive insufficient allowance for their support from the poor rates, and "the mode of providing employment for the poor which may be expedient in some parishes may be inexpedient in others, and it may therefore be desirable to extend the powers of parish vestries in order that such a course may be pursued as may be best adapted to the peculiar circumstances of each parish," and enabled vestries (without interfering with Gilbert's Act), with the approval of justices at petty sessions, to make special agreements solely for the purpose of employing or relieving the poor of the parish.

The following table exhibits the growth of the poor rate from the middle of the last century to a date immediately preceding the reforms effected in 1834:—

Years.	Estimated Population of England and Wales.	Expended on the Relief of the Poor.	Per Head of the Population.
		£	s. d.
1750	6,467,000	689,000	2 2
1760	6,736,000	965,000	3 0
1770	7,428,000	1,306,000	3 6
1780	7,953,000	1,774,000	4 5
1790	8,675,000	2,567,000	5 11
1800	9,140,000	3,861,000	8 5
1810	10,370,000	5,407,000	10 3
1818	11,702,000	7,890,000	13 4
1820	12,046,000	7,329,000	12 2
1830	13,924,000	6,829,000	9 9
1832	14,372,000	7,036,000	9 9

It will be observed that subsequent to 1818 there was an apparent diminution in the whole sum expended for the relief of the poor, making a difference of between 11 and 12 per cent.; but the decline in the prices of the necessaries of life (wheat alone had fallen considerably,—more than one-half in one of the intermediate years) was more than equivalent to the difference.

The conviction, arising principally from the increase of the poor rates, that a change was necessary either in the Commis- the poor law as it then existed or in the mode of its administra- tion led to the issuing of a commission in 1832 "to make diligent and full inquiry into the practical operation of the laws for the relief of the poor in England and Wales, and into the manner in which those laws were administered, and to report their opinion as to what beneficial alterations could be made." The result of this inquiry was laid before parliament in 1834. The commissioners reported "fully on the great abuse of the legislative provision for the poor as directed to be employed by the statute of Elizabeth," finding "that the great source of abuse was the out-door relief afforded to the able-bodied on their own

Poor-Law Amend-ment Act, 1834.

account or on that of their families, given either in kind or in money." They also reported that "great maladministration existed in the workhouses." To remedy the evils they proposed considerable alterations in the law, and the principal portion of their suggestions was embodied in the Poor-Law Amendment Act, 1834 (4 & 5 Will. IV. c. 76).

The Act was based on the principle that no one should be suffered to perish through the want of what is necessary for sustaining life, but at the same time that if supported at the expense of the public he must be content to receive such support on the terms most consistent with the public welfare; and the objects of the Act were first to raise the labouring classes, that is to say, the bulk of the community, from the idleness, improvidence, and degradation into which the maladministration of the laws for their relief had thrown them, and, secondly, to immediately arrest the progress and ultimately to diminish the amount of the pressure on the owners of lands and houses.

Poor-Law Commis-sioners.

Under the Act three commissioners were appointed (originally for five years, but subsequently continued from time to time) styled "the Poor-Law Commissioners for England and Wales," sitting as a board, and appointing assistant commissioners and other officers. The administration of relief according to the existing laws was subject to their direction and control, and to their orders and regulations for the government of workhouses and the guidance and control of guardians and vestries and the keeping and allowing of accounts and contracts, without interfering with ordinary relief in individual cases.

Forma-tion of districts and poor-law unions.

The favourable state of the country at the time presenting many facilities for the introduction of the law, which it was important to render available with as little delay as possible, the whole of England and Wales was divided into twenty-one districts, to each of which an assistant commissioner was appointed. The commissioners under their powers (gradually put into operation—a circumstance which beneficially affected legislation of the period, as, for example, the commutation of tithes and the introduction of police) formed poor-law unions by uniting parishes for general administration, and building workhouses, guardians elected by the ratepayers (or *ex officio*) having the general government and administration of relief. The expense was apportioned to each parish on settled principles and rules, with power, however, to treat the united parishes as one for certain purposes. Outdoor relief might be given, on the order of two justices, to poor persons wholly unable to work from old age or infirmity. No rule appears to have been more fully sanctioned by practical results as of an advantageous nature than that under which the country was by degrees parcelled out into unions. In parishes no adequate power existed for carrying into effect the rules and regulations of the amended system. No principle of classification could be adopted within the workhouses, and the law was liable to be thwarted in its most material objects by petty interests of a local and personal character. With the aid of boards of guardians and their subordinate officers these interests were neutralized, and the law was rendered uniform in its operation. The economical advantages derived from acting on an enlarged scale are self-evident. Waste unavoidably takes place when the purchase of supplies for a single parish forms a separate transaction.

Cost of adminis-tration.

The second report of the commissioners showed that of one hundred and ten unions which had been in operation more than a year, the saving in forty-three of the largest was 46 per cent.; in twenty-four of the smallest unions the rate of saving was not more than 29 per cent.; and in twenty-six unions of intermediate size a saving of 42 per cent. was effected. Even in many parishes not then included in a union the wide promulgation of the principles of the amending Act gave an impulse to improve-

ment in the administration of the poor laws, which was attended by a marked reduction in the expenditure.

The total amount of money expended in the relief of the poor in England and Wales during the twelve years prior to the passing of the Poor-Law Amendment Act (1823 to 1834) amounted to upwards of £76,096,000, and during the twelve subsequent years to less than £57,247,000. As the commissioners early remarked—

"It could not be expected that an Act which so materially disturbed the distribution of as large a sum of money as £7,000,000 per annum, which of necessity changed the source from which a large portion of the inhabitants of the country derived their customary means of subsistence, and which in so doing opposed itself not only to the interests, the prejudices, and the fears of a large portion of the population, but pressed hardly on the sincere though mistaken notions of charity which were established in the hearts of others, could possibly be carried into effect without difficulty and resistance.

The obstacles which the Act had to contend with in the metropolis chiefly arose from the confusion and perplexity of jurisdiction which existed in the one hundred and seventy parishes comprised within the city of London and the metropolitan district, some of these containing governing bodies of their own; in some the parish business was professedly managed by open vestries, in others by select vestries, and in addition to these there were elective vestries, under Sturges Bourne's Act, Sir John Hobhouse's Act, and other Acts; and the majority of the large parishes were managed under local Acts by boards of directors, governors, and trustees. These governing bodies executed a great variety of functions besides regulating the management of the poor. The power, patronage, and the indirect advantages which arose from the administration of the local funds were so great that much opposition took place when it was proposed to interfere by constituting a board to be annually chosen and freely elected by the ratepayers, on which the duty of regulating the expenditure for the relief of the poor was to depend. The general management of the poor was, however, on a somewhat better footing in London than in the country.

Some opposition was experienced to the introduction of the full benefits of the Act into the unions incorporated under Gilbert's Act, many provisions of which conflicted with the new system. On the early dissolution of seventeen of those incorporations by the commissioners under their powers, it was found, however, that the rates were sensibly diminished. Much resistance of a general nature was encountered. Not only was the economical working of the new principles of management disputed, but a strong feeling was aroused against what was thought to be the inhumanity of the rigorous rules to which paupers had to submit in workhouses. While many proofs existed of the necessity for the introduction of a new system—such as that, while wheat was rotting in pauperized and as yet unreformed districts of the south of England for want of reapers at 21s. and 24s. an acre, at the very same time able-bodied healthy men were lying under the hedges in another part of the same county with a parish allowance of 3s. a week—on the other hand, it was felt as a grievance that old couples were refused relief at their own houses, and that if they entered the workhouse the sexes were separated. Throughout the country the reproachful name of "Bastille" was attached to the workhouse, and this is in many districts still retained, though no longer as an intended censure. In part of Devonshire prejudice was carried to the extent of a rumour leading poor persons to believe that the bread distributed by the relieving officers was mixed with poisonous ingredients.

Both Houses of Parliament were inundated for years with petitions against the new system; meetings were held at which inflammatory language was used; and in

some instances riotous proceedings marked the opposition. It was remarked that the acts of violence were in the most pauperized districts, which had been conspicuous for the maladministration of the poor rates. The work, however, went forward, although three parliamentary committees (one of the Lords and two of the Commons) instituted a searching and severe scrutiny before the organization of the system was completed. Notwithstanding adverse circumstances, including stagnation of trade, cold weather, and an epidemic of great severity, by the end of 1837 nearly the whole of England had been formed into unions; the benefits of the new system were gradually recognized, and a poor law was introduced into Ireland (see IRELAND). As to poor-law administration in Scotland see SCOTLAND.

Medical
attend-
ance.

The reform of the poor laws affected a variety of persons besides paupers and ratepayers. No question was more widely discussed than that of medical attendance on the sick poor. The outdoor relief of the sick was usually effected by a contract with a surgeon, which, however, in general only included those who were parishioners. When non-parishioners became chargeable from illness, an order for their removal to their place of settlement was obtained, which was suspended until they could perform the journey; in the meantime they were attended by the local surgeon, but at the expense of the parish to which they belonged. The poor-law commissioners in their report of 1834 stated that on the whole medical attendance seemed in general to be adequately supplied and economically, considering only the price and the amount of attendance. Great good was effected by the establishment of dispensaries promoted by Mr Smith of Southam to enable the labouring classes to defray, from their own resources, the expense of medical treatment. While stating that the country was much indebted to him for his exertions, the commissioners were not prepared to suggest any legislative measures for their encouragement; but dispensaries have been recently applied to the relief of the poor in the metropolis. The medical and surgical association (now the British Medical Association), of which Sir Charles Hastings was president, took up the subject, and a committee, over which Dr Davis (of Presteign) presided, made an inquiry and report,—by no means in hostility to, but in full accord with, the chiefs of the new poor-law administration. The present mode of giving medical relief is noticed below.

Local
Govern-
ment
Board.

After an intermediate transfer in 1847 of the powers of the poor-law commissioners, and the constitution of a fresh board styled “commissioners for administering the laws for relief of the poor in England,” it was found expedient to concentrate in one department of the Government the supervision of the laws relating to the public health, the relief of the poor, and local government; and this concentration was in 1871 carried out by the establishment (by Act of Parliament 34 & 35 Vict. c. 70) of the Local Government Board.

In the subsequent part of this article the governing board, whether the original poor-law commissioners or commissioners for administering the laws for relief of the poor, or the present local government board, is spoken of as the central board, as the orders at present in force are of various dates, and chiefly issued before the existence of the present local government board.

By numerous Acts of Parliament passed subsequent to the Amendment Act of 1834 the administration of relief has been affected in various ways. It would be an unprofitable task, and inconsistent with the objects and limits of this article, to give a chronological summary of those Acts down to the present time, but they are taken into account in treating of various heads of poor-law administration.

It is to be observed that the relief of the poor of every union governed by a local Act is administered by a board of guardians elected according to the Poor-Law Acts.

Although containing very important provisions, the Act of 1834 was rather to restore the scope and intention of the statute of Elizabeth by placing its administration in the hands of responsible persons chosen by the ratepayers, and themselves controlled by the orders of a central body, than to create a new system of poor laws.

The agents and instruments by which the administration of relief is afforded are the following.

The guardians of the poor regulate the cases and description of relief within the union; a certain number of guardians are elected dians from time to time by the ratepayers. The number is determined by the central board, by whom full directions as to the mode of election are given. In addition to those elected there are *ex officio* guardians, principally local magistrates. The guardians hold their meetings frequently, according to the exigencies of the union. Individual cases are brought to their notice,—most cases of resident poor by the relieving officer of the union, the case of casual paupers by him or by the workhouse officers by whom they were admitted in the first instance. The resident poor frequently appear in person before the guardians. The mode of voting which the guardians follow in respect to any matter they differ on is minutely regulated, and all their proceedings as well as those of their officers are entered in prescribed books and forms. They have a clerk, generally a local solicitor of experience, who has a variety of responsible duties in advising, conducting correspondence and keeping books of accounts, and carrying out the directions of the guardians, who in their turn are subject to the general or special regulations of the central board. The various officers of the union from the medical officer to workhouse porters, including masters and matrons of workhouses, are generally appointed by the guardians; and the duties of all the officers are specifically prescribed by the regulations issued by the central board.

Among a multitude of miscellaneous duties and powers of the guardians, apart from the ordinary duties of ordering or refusing relief in individual cases and superintending the officers of the union, the duties devolve on them of considering the adjustment of contributions to the common fund whether of divided or added parishes, and matters affecting other unions, the building of workhouses and raising of money for that and other purposes, the taking of land on lease, the hiring of buildings, special provisions as to superannuation and allowances to officers, the maintenance and orders as to lunatics apart from individual instances, and the consideration of questions of settlement and removal. A paramount obligation rests on the guardians to attend to the actual visitation of workhouses, schools, and other institutions and places in which the poor are interested, and to call attention to and report on any irregularity or neglect of duty. Guardians may charge the rates with the expenses of attending conferences for the discussion of matters connected with their duties (Poor-Law Conferences Act, 1833). In relation to expenditure the guardians have very considerable but restricted powers. Among other officers they appoint a treasurer for the union.

Overseers of the poor are still appointed under the statute of Elizabeth, and the guardians cannot interfere with the appointment. As, however, the relief of the poor is now administered by boards of guardians, the principal duties of overseers relate to the making and collecting of rates and payments. The guardians, by order of the central board, may appoint assistant overseers and collectors. Inspectors appointed by the central authority assist in the execution of the poor laws by periodically visiting and inspecting every workhouse and place wherein any poor person in receipt of relief is lodged, attending meetings of boards of guardians and every local meeting at which general questions may be raised or discussed, and taking part in meetings but not voting at them. The inspectors have great powers in calling before them and examining persons and books and proceedings. Besides the usual inspectors, persons may be appointed by the central authority to act, in conducting special inquiries.

Provisions relating to expenditure and the audit of accounts are noticed in a subsequent part of this article.

Some principles connected with the system of poor-law administration call for concise notice.

As the right to relief exists, the law recognizes the obligation to afford it to persons unable to maintain themselves. The refusal of the officers whose duty it is to give it is an indictable offence; and, although a means of punishment does not constitute a remedy, it seems a mandamus to guardians of the poor will, in extreme and exceptional cases, be granted. The liability to summary

proceedings now, however, operates as a preventive to neglect of duty. If, by reason of the neglect of overseers to collect rates or to pay the guardians of the poor, any relief directed by the guardians to be given to any poor person is delayed or withheld, or if overseers disobey a justice's order to give temporary relief, or if any officer wilfully neglects or disobeys the orders of the central board, penalties are incurred. The control of the central board is, except in very rare cases, found effective to secure the due administration of the law.

The recognition of the right to relief as a legal claim allows and indeed necessitates the imposition of restraints, apart from provisions connected with the law of settlement and removal, more fully noticed hereafter. Persons, however poor, wandering abroad to beg or gather alms, or placing themselves in any public place for that purpose, become subject to the vagrancy laws.

Private relief, pecuniary or otherwise, may be asked for and obtained so long as it does not involve any false pretence or dishonest or prohibited means of gaining a livelihood. Any person able by work or other means to maintain himself or his family, who, by wilful refusal or neglect to do so, becomes chargeable for any part of his family, commits an offence. Poverty or idleness short of this, and apart from the case of liability in respect of children under elementary and industrial school Acts, is not an offence against the law.

Obliga-
tion to
make use
of public
provision.

There are circumstances, however, where relative liabilities make it a duty for persons to avail themselves of the public provision for relief. The culpable neglect of a person to provide another under his control and in his legal custody, who is actually helpless, as an infant or lunatic, with the means of life constitutes a crime, and by the express provision of a poor-law Act any parent wilfully neglecting to provide adequate food, clothing, medical aid, or lodgings for his child, being in his custody under the age of fourteen, whereby the health of such child is or is likely to be seriously injured, may be summarily convicted (31 & 32 Vict. c. 122), in analogy to the law making it an indictable misdemeanour for a master or mistress who is legally liable to provide any apprentice or servant with necessary food, clothing, or lodging, wilfully and without lawful excuse to refuse or neglect so to provide (24 & 25 Vict. c. 100). Something more than the mere abstention from seeking parochial relief without any intentional neglect is necessary to lay a criminal as distinguished from a moral responsibility on destitute persons.

Private-
relief not an
offence.

Although under the vagrancy laws public begging is an offence, the giver of such unlawful charity is not subject to legal restraint. In early times attempts were made to impose such restraints. An Act of 1349 (23 Edw. III. c. 7) provided that none on pain of imprisonment should under colour of piety or alms give anything to a beggar who was able to labour, and nearly two centuries later an Act (22 Hen. VIII. c. 12) already noticed, relating to poor compelled to live by alms, and the punishment of vagabonds and beggars, provided that any person giving any harbour, money, or lodgings to any strong beggar who violated the statute should make such fine to the king as the justices in sessions should appoint; and as late as the commencement of the 17th century givers to beggars were subject to a penalty (1 Jas. I. c. 7). These Acts, however, eventually disappeared from the statute book.

Dr Burn advocated, as has been seen, the infliction of a penalty for relieving a common beggar; but, although aiders and abettors in the commission of even petty offences are now punishable, it is not attempted to apply the law to bestowers of charity, whether in the streets and highways or elsewhere.

It is in vain to impose the doctrines of political economy

in restraint of natural instincts. Such doctrines are scattered as chaff before the wind when opposed by the teachings of the nursery rhymes of "The Beggar's Petition," or to the fascinating description where the beggar figures as "a well-remembered guest," or to the sympathy enlisted by Charles Lamb's essay "A Complaint of the decay of Beggars in the Metropolis."

Although in most cases the relief given to the poor is practically a gift, and does not constitute an available debt, the plan of giving relief by way of advance as a loan was introduced early in the present century, and the Poor-Law Amendment Act (1834) enacted that any relief, or the cost thereof, which shall be given to or on account of any poor person above the age of twenty-one or to his wife or any part of his family under the age of sixteen, and which the said commissioners shall by any rule, order, or regulation declare or direct to be given or considered as given by way of loan, and whether any receipt for such relief, or engagement to pay the same, or the cost price thereof, or any part thereof, shall have been given or not by that person to or on account of whom the same shall have been so given, shall be considered, and the same is hereby declared to be, a loan to such poor person (4 & 5 Will. IV. c. 76, § 58). By the same Act power was given to enforce payment by means of a summons before justices to attach wages. A subsequent statute gives power to the guardians to recover loans to paupers in the county court (11 & 12 Vict. c. 110). By order of the central board, guardians may, in the cases within the provision of the Poor-Law Amendment Act above set out, give relief by way of loan, but no relief contrary to the regulations can be given in this way. The restriction was necessary, as formerly some guardians granted outdoor relief by way of loan contrary to the recent principles of administration of relief.

The criminal liability of parents and others *in loco parentis* to provide sustenance has been considered. The purely civil liability for necessities under implied contracts is of course outside the scope of this article, but there is an express liability created by the poor laws. The liability of the father and grandfather and the mother and grandmother and the children of poor persons under the statute of Elizabeth has been set out in an earlier part of this article. The statute extends only to natural relations. The liability is enforced by orders of magistrates after chargeability, who adjudicate as to the amount after hearing the facts and taking into consideration the ability of the relative. The relief of actual destitution should always precede investigation as to the liability of other persons than the parish to contribute to it. Indeed actual chargeability to the union is in general a condition precedent to an order upon the relative.

In treating of the persons entitled to relief it may be mentioned that, in accordance with the general law, a wife is to be treated as one with her husband who is compellable to maintain her; and, as on the one hand the wife is entitled under ordinary circumstances to relief equally with the husband, the latter is the person to apply for and to receive relief.

With respect to children, they form part of the father's family until they become "emancipated." During the minority of a child there can be no emancipation, unless he marries and so becomes himself the head of a family, or contracts some other relation so as wholly and permanently to exclude the parental control.

By the amendment of the poor laws in 1834 all relief given to or on account of the wife, or children under sixteen, not being blind or deaf and dumb, is considered as given to the husband or father as the case may be; and any relief given to children under that age of a

of rela-
tions.

widow is considered as given to her (4 & 5 Will. IV. c. 76, § 56); but this provision does not interfere with the liability imposed by the statute of Elizabeth. Further a man marrying a woman having legitimate or illegitimate children is liable to maintain them as part of his family, and is chargeable with all relief on their account until they attain sixteen or until the death of the mother (*ibid.*, § 57). A married woman having separate property is liable for the maintenance of her husband and children on their becoming chargeable (45 & 46 Vict. c. 75).

The position of illegitimate children and their parents stands on a distinct foundation. By a statute of 1576 (18 Eliz. c. 3) justices were empowered at discretion to charge the mother and reputed father of bastards with their maintenance on the pain of imprisonment in default. The principle of this statute, renewed and not expressly repealed until recently, is carried out now, after receiving repeated attention, especially on the great reform of the poor laws and administration of relief in 1834, by an order of maintenance on the reputed father, at the instance of the mother, or where the child is actually chargeable to a union or parish at the instance of the guardians. Such order is in force until the child is thirteen, and in some instances until sixteen. The main features of the Acts are concisely stated in the article BASTARDY.

The
exig-
encies ne-
cessitat-
ing re-
lief.

The conditions of persons entitled to relief are indicated by the terms of the statute of Elizabeth. If they fall within the definitions there given they have right to relief. A fundamental principle with respect to legal relief of the poor is that the condition of the pauper ought to be, on the whole, less eligible than that of the independent labourer. The pauper has no just ground for complaint, if, while his physical wants are adequately provided for, his condition is less eligible than that of the poorest class of those who contribute to his support.

Although a fund has become a practical necessity, it should be always borne in mind that he who claims it is not honest if his own labour and work can suffice to provide for his wants. It is as immoral and unjust to take unnecessarily from the industrious and saving by force of a law made and a tax raised for other objects as it would be for a labourer of equal means to pillage and take from the pocket of his fellow labourer.

If a state of destitution exists, the failure of third persons to perform their duty, as a husband, or relative mentioned in the statute of Elizabeth, neglecting those he is under a legal obligation to support, is no answer to the application. The relief should be afforded, and is often a condition precedent to the right of parish officers to take proceedings against the relatives or to apply to other poor unions. The duty to give immediate relief must, however, vary with the circumstances. The case of wanderers under circumstances not admitting of delay may be different from that of persons resident on the spot where inquiry as to all the circumstances is practicable. The statute of Elizabeth contemplated that the relief was to be afforded to the poor resident in the parish, but it is contrary to the spirit of the law that any person shall be permitted to perish from starvation or want of medical assistance. Whoever is by sudden emergency or urgent distress deprived of the ordinary means of subsistence has a right to apply for immediate relief where he may happen to be. Persons comprehended within this class are called "casual poor," although the term "casuals" is generally used in reference to vagrants who take refuge for a short time in the "casual wards" of workhouses.

Various tests are applied to ascertain whether applicants are really destitute. Labour tests are applied to the able-bodied, and workhouse tests are applied to those to whom entering a workhouse is made a condition of relief.

Nature
and kind
of relief.

As to the nature and kind of relief given under the poor laws the great distinction restored rather than introduced by the amendment of the poor-law system in 1834 was giving all relief to able-bodied persons or their families

in well-regulated workhouses (that is to say, places where they may be set to work according to the spirit and intention of the statute of Elizabeth), and confining outdoor relief to the impotent—that is, all except the able-bodied and their families. Although workhouses formed a conspicuous feature in legislation for the poor from an early period, the erection of those buildings for unions throughout the country where not already provided followed immediately on the amendment of the system in 1834. Since that time there has been a constant struggle between the pauper class and the administrators of the law, the former naturally wishing to be relieved at their own homes, and in many instances choosing rather to go without aid than to remove within the walls of the workhouse.

Relief given in a workhouse is termed "in (or indoor) maintenance" relief, and when given at the homes of the paupers is termed "outdoor relief." The regulations, accounts, and returns to parliament, as well as the principles governing relief, are based on these distinctions. It is impossible, however, to apply rigid principles very closely, or rather the exceptions in practice are so numerous that the majority of resident poor are relieved at their own homes by being supplied with necessaries in kind, or by payment either wholly or in part in coin, as circumstances are held to demand or warrant. The general order is that every able-bodied person, male or female, requiring relief shall be relieved only in the workhouse, together with such of the family as may be resident with such able-bodied person, and not in employment, including his wife residing with him. The exceptions made are where the person requires relief on account of sudden and urgent necessity, or on account of any sickness, accident, or bodily or mental infirmity affecting such person or any of his family; where relief is required for the purpose of defraying the expenses of burial of any of the family; in the case of widows, relief in the first six months of her widowhood when she has legitimate children dependent upon her incapable of earning a livelihood, and has no illegitimate children born after her widowhood. Further relief in or out of the workhouse may be given by guardians in their discretion to a wife or children of an able-bodied man not resident within the union.

By the Industrial School Act any child found begging or receiving alms (whether actually or under the pretext of selling or offering for sale anything), or being in any street or public place for the purpose of begging or receiving alms, or found wandering and not having any home or settled place of abode or proper guardianship or visible means of subsistence, or found destitute, either being an orphan or having a surviving parent who is undergoing penal servitude or imprisonment, or that frequents the company of reputed thieves (as also in some other cases recently added), may be sent to a certified industrial school, and while a school is being found justices may order detention for a week in the workhouse.

In the metropolis justices have power to cause inmates of dangerous structures to be received into a workhouse.

Besides workhouses, district asylums are provided for the destitute poor in certain places. Under the Poor-Law Amendment Act, 1844, reciting that it was expedient that more effectual means should be provided for the temporary relief of poor persons found destitute and without lodgings within the district of the metropolitan police or the city of London, and in Liverpool, Manchester, Bristol, Leeds, and Birmingham, district boards were established, by which provision is made for such temporary relief and setting to work therein of any poor person found destitute within any such district, not professing to be settled in any parish included in it and not known to have any place of abode there and not charged with any offence under the Vagrant Act.

Asylums.

In 1867 under the Metropolitan Poor Act of that year unions and parishes in the metropolis were by order of the board formed into asylum districts, in each of which there is one asylum or more for the reception and relief of the sick, insane, or infirm, under a body of managers partly elective and partly nominated by the board, who build or hire asylums and furnish them, and appoint committees. The attendance at the asylum of a special commissioner of lunacy is provided for. Special provision is made as well for outdoor as indoor medical relief by providing dispensaries and the dispensing of medicines, with regulations for the appointment of medical officers in the district.

The necessarily large expenditure for the asylums is principally defrayed by a fund called the metropolitan common poor fund, by contributions from the several unions, parishes, and places in the metropolis. The amount of the respective assessments is determined by the local government board according to the valuation lists (noted hereafter) or on such other basis as the board directs, the contribution being enforced by a precept of the board; and the bodies called on to pay levy the amount by a rate on occupiers of rateable property in the nature of a poor rate.

Work-house rules.

Admission to a workhouse may be by a written order of the board of guardians, or by the master or matron (or in their absence by the porter) without an order in any case of sudden or urgent necessity, or provisionally by a relieving officer, or overseer, or churchwarden. Any person who is brought by a policeman as having been found wandering in a state of destitution may be admitted. It is to be observed generally, with respect to all persons who may apply for admission into the workhouse under circumstances of urgent necessity, that their destitution, coupled with the fact of being within the union or parish, entitles them to relief, altogether independently of their settlement (see below), if they have one, which is a matter for subsequent inquiry.

The regulations for the government of workhouses fall under two classes:—(1) those which are necessary for the maintenance of good order in any building in which considerable numbers of persons of both sexes and of different ages reside; (2) those which are necessary in order that these establishments may not be almshouses, but workhouses in the proper meaning of the term.

The inmates of a workhouse are necessarily separated into certain classes. In no well-managed institution of this sort, in any country, are males and females, the old and the young, the healthy and the sick, indiscriminately mixed together. The general classification of paupers in the workhouse so far as the structure admits is as follows:—Class 1, men infirm through age or any other cause; Class 2, able-bodied men, and youths above the age of fifteen; Class 3, boys above the age of seven and under fifteen; Class 4, women infirm through age or any other cause; Class 5, able-bodied women, and girls above fifteen; Class 6, girls above seven and under fifteen; Class 7, children under seven. To each class is assigned that ward or separate building and yard which may be best fitted for the reception of such class, and each class is without communication with those of any other class. Guardians are required to divide the paupers into the seven classes, and to subdivide any one or more of these classes in any manner which may be advisable, and which the internal arrangements of the workhouse admit; and the guardians are required from time to time, after consulting the medical officer, to make necessary arrangements with regard to persons labouring under any disease of body or mind, and, so far as circumstances permit, to subdivide any of the enumerated classes with reference to the moral character or behaviour or the previous habits of the inmates, or to such other grounds as may seem expedient.

For example, it is very desirable that females of dissolute and disorderly habits should be separated from those of a good character, for it is the duty of the guardians to take all reasonable care that the morals of persons admitted into the house be not corrupted by intercourse with inmates of this description; but this has reference to continued ill-conduct, and is not in any way to be a punishment for offences committed previous to entrance into the workhouse and discontinued before admission.

The separation of married couples was long a vexed question, the evils on the one hand arising from the former unrestricted practice being very great, while on the other hand the separation of old couples was felt as a great hardship, and by express statutory provision in 1847 husband and wife, both being above the age of sixty, received into a workhouse cannot be compelled to live separate and apart from each other (10 & 11 Vict. c. 109, § 23). This exemption was carried somewhat further by contemporaneous orders of the board, under which guardians were not compelled to separate infirm couples, provided they had a sleeping apartment separate from that of other paupers; and in 1876 guardians were empowered, at their discretion, to permit husband and wife where either of them is infirm, sick, or disabled by any injury, or above sixty years of age, to live together, but every such case must be reported to the local government board (39 & 40 Vict. c. 61, § 10).

Children under seven are placed in such of the wards appropriated to female paupers as may be deemed expedient, and their mothers are permitted to have access to them at all reasonable times; fathers or mothers who may be desirous of seeing any child who is in the same workhouse have a daily interview; and arrangements are made for permitting members of the same family who are in different workhouses of the union to have occasional interviews with each other at such times and in such manner as best suits the discipline of the several workhouses.

Casual and poor wayfarers admitted by the master and matron are kept in a separate ward and dieted and set to work in such manner as the guardians by resolution direct; and whenever any vagrants or mendicants are received into a workhouse they ought (as a precaution necessary for preventing the introduction of infectious or contagious diseases) to be kept entirely separate from the other inmates, unless their stay exceeds a single night.

The guardians may direct that any pauper inmate of the workhouse of any class, except casual paupers, shall be detained in the workhouse after giving notice to quit it, for limited periods. A casual pauper (that is, any destitute wayfarer or wanderer applying for or receiving relief) is not entitled to discharge himself from a casual ward before 9 A.M. of the second day following his admission,

or of the fourth day if he has been previously admitted more than once within a month, nor before he has performed the work prescribed for him (Casual Poor Act, 1882).

Infirmaries are attached to many workhouses, especially in the metropolis, and also in some cases there are infirmaries for the poor distinct from the workhouse; all are governed and regulated under the orders of a central board.

The outdoor labour test order of the local government board directs that every able-bodied male pauper who may receive relief within the union out of the workhouse shall be relieved in the following manner:—half at least of the relief given to such pauper shall be given in food, clothing, and other articles of necessity, and no such pauper shall receive relief from the guardians of the union or any of their officers or any overseer while he is employed for wages or other hire or remuneration by any person; but every such pauper shall be set to work by the guardians. The kind of work is reported to the board. A departure from the order is, however, permitted if approved by the board.

To prevent the practice formerly prevailing in some parts whereby the poor rates were used for the payment of rents directly to the landlords, the guardians and parish officers are prohibited from paying the rent of the house or lodging of any pauper, or applying any relief in such payment directly or indirectly. This does not apply, however, to any shelter or temporary lodging procured in any case of sudden and urgent necessity, or mental imbecility; nor does it prevent the guardians, in regulating the amount of relief to be afforded to any particular person, from considering the expense to be incurred in providing lodging. This allows of supplying to the pauper the means of paying for a lodging instead of requiring him to come into the workhouse in such exceptional cases.

Modern remedial legislation and public efforts connected with improved dwellings for labourers and artisans, as well as for the poor generally, are distinct from the laws for the compulsory relief of the poor,—although, like education, the whole subject of amelioration of classes admits in some of its aspects of being viewed together. The allotment of land to industrious poor has been also of great service (Allotments Extension Act, 1882).

Guardians having greater provision for the reception of poor children in their workhouse than they require may with the consent of the board contract with the guardians of any other union or parish for the reception, maintenance, and instruction of any poor children under sixteen being orphans or deserted by their parents or whose parents consent (14 & 15 Vict. c. 105; 29 & 30 Vict. c. 113).

A consolidated order comprising workhouse regulations prescribes that the boys and girls who are inmates of a workhouse shall, for three of the working hours at least every day, be instructed in reading, writing, arithmetic, and the principles of the Christian religion, and such other instruction shall be imparted to them as may fit them for service, and train them to habits of usefulness, industry, and virtue.

In relation to education of poor children out of the workhouse there has been much legislation. To go no farther back, the Act of 1855, providing for the education of children in the receipt of outdoor relief (18 & 19 Vict. c. 34, known as Denison's Act), was superseded in 1873 by the Elementary Education Act of that year (36 & 37 Vict. c. 86), containing a special clause for the education of children relieved out of the workhouse and the payment of school fees, but this clause was in turn repealed by the Elementary Education Act, 1876 (39 & 40 Vict. c. 79), making it the duty of every parent to cause a child to receive efficient elementary instruction in reading, writing, and arithmetic. See EDUCATION.

By this Act a provision substituted for that of 1873 enacts that where relief out of the workhouse is given by the guardians or by their order by way of weekly or other continuing allowance to the parent of any child above the age of five years who has not reached the standard in reading, writing, and arithmetic prescribed by a certain code, or who for the time being either is prohibited by the Act from being taken into full time employment, or who by any bye-law under the earlier Elementary Education Act of 1870 is required to attend school, it shall be a condition for the continuance of such relief to the parent or child that elementary education in reading, writing, and arithmetic shall be provided for such child, and the

guardians are required to give such further relief (if any) as may be necessary for that purpose. Such relief cannot be granted on condition of the child attending any public elementary school other than such as may be selected by the parent, nor refused because the child attends or does not attend any particular public elementary school. Moreover the guardians have no power under this provision to give any relief to a parent in order to enable such parent to pay more than the ordinary fee payable at the school which he selects, or more than the fee which under the provisions of the Act they can enable a parent to pay in any other case. All relief given by the guardians under this provision is deemed to be relief within the meaning of the poor laws and payable out of their common fund (39 & 40 Vict. c. 79, § 40; see also § 34). A child cannot, as a condition of the continuance of relief out of the workhouse under the above provision, be required to attend school further or otherwise than is obligatory by any bye-law of a school board (43 & 44 Vict. c. 23, § 5).

Money given for the payment of school fees for any child of a parent who is not a pauper and is resident in any parish is charged by the guardians having jurisdiction to that parish with other parochial charges (39 & 40 Vict. § 35).

The education of poor children is closely connected with the system of "boarding out," as it is termed. The guardians of certain unions are empowered to board out pauper children in homes beyond the limits of the union, provided the guardians have entered into approved arrangements which include education (boarding-out order 1870); and by a statute of 1862 (still unrepealed, except so far as by implication provisions are superseded) the guardians of any parish or union may send any poor child to any school certified to the board as fit for their reception and charge the expenses in the same manner as other relief. Unless an orphan or deserted or having the consent of a parent, a child cannot be sent under this statute, and no child can be kept against its will if above fourteen. Such school is open to inspection (25 & 26 Vict. c. 43).

Under the last-mentioned statute, the amount which might be paid by a board of guardians for the maintenance of a child in an institution certified under that statute was limited to the cost of the maintenance of the child in the workhouse; but by the Divided Parishes and Poor-Law Amendment Act, 1882, the guardians may pay the reasonable expenses incurred in the maintenance, clothing, and education of the child to an amount sanctioned by the local government board. The board has accordingly sanctioned rates of payment, and in practice, when issuing a certificate, specifies the maximum amount which may be paid by the guardians as a reasonable allowance towards the maintenance of any pauper child sent to the institution.

It is to be observed that the provisions of the Elementary Education Acts as to the employment of children by employers in school districts not within the jurisdiction of a school board, consisting of a parish and not a borough, must be enforced by the school committee of guardians of the union (39 & 40 Vict. c. 79, § 7).

The daily average number of children of both sexes attending the schools of the union workhouses, &c., in England and Wales during the half-year ended at Lady Day 1883 was 26,170. Added to this total there is the average daily attendance at district schools, 7488, and 488 in the metropolitan asylum district, making a total of 34,146. The amount paid to boards of guardians and managers out of the parliamentary grant in respect of the salaries of workhouse and district school teachers for the year ending Lady Day 1883 was £38,629, 11s.

Various provisions relating to the apprenticeship of poor children have been noticed in tracing the progress of legislation. Guardians are not restricted from binding as apprentices children who are not actually in the receipt of relief or whose parents may not be in the receipt of relief as paupers at the time of the binding. Such children as may ordinarily be considered "poor children" are within the scope of the provisions respecting the apprenticeship of pauper children. But apprenticeship under the poor laws is a species of relief which can only be given subject to the general or special regulations on the subject.

The general orders direct that no child under the age of nine years and no child (other than a deaf and dumb child) who cannot read and write his own name shall be bound apprentice by the guardians, and no child is bound to a person who is under twenty-

one or who is a married woman, or to a person who is not a house-keeper or assessed to the poor rate in his own name, or who is a journeyman or a person not carrying on trade or business on his own account. And no child can be bound, unless in particular cases, to a master whose place of business is more than 30 miles from the residence of the child at the time of binding. The term of apprenticeship is discretionary with the guardians, but no apprentice can be bound for more than eight years, and if the child is above fourteen his own consent is required. If under sixteen his father's consent (or, if his father is dead, his mother's if living) is necessary. Various preliminaries to the binding are requisite, affecting the health and strength of the child and all attendant circumstances. When any premium is given it must in part consist of clothes supplied to the apprentice and in part of money to the master. The duties of the master of a pauper apprentice are specially provided for both by statute and by the regulations adopted by the local government board.

In the administration of medical relief to the sick, the Medical objects kept in view are—(1) to provide medical aid for relief persons who are really destitute, and (2) to prevent medical relief from generating or encouraging pauperism, and with this view to withdraw from the labouring classes, as well as from the administrators of relief and the medical officers, all motives for applying for or administering medical relief, unless where the circumstances render it absolutely necessary.

Unions are formed into medical districts limited in area and population, to which a paid medical officer is appointed, who is furnished with a list of all such aged and infirm persons and persons permanently sick or disabled as are actually receiving relief and residing within the medical officer's district. Every person named in the list receives a ticket, and on exhibiting it to the medical officer is entitled to advice, attendance, and medicine as his case may require. Medical outdoor relief in connexion with dispensaries is regulated in asylum districts of the metropolis by the Metropolitan Poor Act, 1867 (30 & 31 Vict. c. 6).

A lunatic asylum is required to be provided by a Pauper county or borough for the reception of pauper lunatics, lunatics with a committee of visitors who, among other duties, fix a weekly sum to be charged for the lodging, maintenance, medicine, and clothing of each pauper lunatic confined in such asylum. Medical officers of unions and parishes, having knowledge that any resident pauper is or is deemed to be a lunatic, give written notice to relieving officers or other officers, and such officers, having knowledge either by such notice or otherwise of the fact, must apply to a justice, who requires the relieving officer to bring the pauper before him, or some other justice, calling to his assistance a duly qualified medical man (physician, surgeon, or apothecary), and upon his certificate, and the justice: upon view or examination or other proofs being satisfied that such pauper is a lunatic and a proper person to be taken charge of and detained under care and treatment, a written order is made out directing the pauper to be received into such asylum. That is the ordinary mode, but justices may act on their own knowledge, and police-officers have power to apprehend wandering lunatics and take them before justices.

The Metropolitan Poor Act, 1867, already noticed, contains many provisions applicable to insane poor, including the right of the commissioners of lunacy to visit the asylums.

In some cases when duly authorized a lunatic may be received into a registered hospital or house duly licensed for the reception of lunatics. No lunatics can be kept in a workhouse more than fourteen days except under special circumstances; minute provisions are made for the care, visitation, and discharge of the lunatics. The central board has made regulations respecting the detention of harmless idiots and other insane persons.

The cost of removal and maintenance is borne by the common fund of the union, and justices sending the pauper, or the visiting justices of an asylum may draw upon the guardians for the amount of the pauper's maintenance in favour of the treasurer, officer, or proprietor of the asylum. Any property of the lunatic is applicable to his maintenance. Special provision is made for inquiry into the settlement and adjudicating it, and for payment of costs of maintenance in accordance with the adjudication (16 & 17 Vict. c. 97, and subsequent Acts). There are also special provisions as to pauper criminal lunatics and sending them to an asylum at the cost of the common fund of the union as in other cases,—to which

expenses, however, the person's property, if he have any (Criminal Lunatics Act, 1884, and Acts there referred to), is applicable.

An increase has taken place for many years past in the number of lunatic paupers. The total number of this class of paupers relieved on 1st January 1883 was larger by 1867 than it was on the corresponding day in 1882.

Settle-
ment.

A settlement is the right acquired in any one of the modes pointed out by the poor laws to become a recipient of the benefit of those laws in that parish or place where the right has been last acquired.

No relief is given from the poor rates of a parish to any person who does not reside within the union, except where such person being casually within a parish becomes destitute by sudden distress, or where such person is entitled to receive relief from any parish where non-resident under justice's order (applicable to persons under orders of removal and to non-resident lunatics), and except to widows and legitimate children where the widow was resident with her husband at the time of his death out of the union in which she was not settled, or where a child under sixteen is maintained in a workhouse or establishment for the education of pauper children not situate in the union, and in some other exceptional cases.

The progress of the law of settlement may be gathered from the statutes already referred to; and, without again adverting to legislation already noticed, and much more not enumerated, it must be sufficient to point out that immediately before the passing of the Poor-Law Amendment Act, 1834, settlements were acquired by birth, hiring and service, apprenticeship, renting a tenement, estate, office, or payment of rates. In addition to these an acknowledgment (by certificate, of which mention has been made, by relief or acts of acquiescence) has practically the effect of a settlement, for, if unexplained, such an acknowledgment stops the parish from disputing a settlement in the parish acknowledging. The Poor-Law Amendment Act, 1834, abolished settlement by hiring and service (or by residence under it) and by serving an office, and by apprenticeship in the sea service. Moreover the guardians of a union might agree (subject to the approval of the commissioners) that all the parishes forming it should for the purposes of settlement be considered as one parish.

It is to be observed that, for the purposes of relief, settlement, and removal and burial, the workhouse of any parish is considered as situated in the parish to which each poor person is chargeable.

There may be a settlement by parentage, for legitimate children take the settlement of their father, or if he has no settlement they are entitled to the settlement of their mother; and it is only when both these sources fail discovery that their right of settlement by birth accrues; for until the settlement of the father or mother has been ascertained the settlement of a legitimate child, like that of a bastard, is in the place where the birth took place.

A settlement attaches to those persons who have a settlement of some kind. Foreigners born out of the country and not acquiring any in one of the modes pointed out must be provided for, if requiring relief, where they happen to be.

Irremov-
ability.

As the burden of maintaining the poor is thrown on the parish of settlement, when the necessity for immediate relief arises in another parish the important question arises whether the pauper can be removed; for, although the parish where the pauper happens to be must afford immediate relief without waiting for removal, the parish of settlement cannot in general be charged with the cost unless the pauper is capable of being removed. The question of removability is distinct from settlement. A pauper often acquires a status of irremovability without gaining a settlement.

Irremovability is a principle of great public importance quite irrespective of the incident of cost as between one parish or another. Before the introduction of a status of irremovability removal might take place (subject to powers of suspension in case of sickness and otherwise) after any interval during which no legal settlement was obtained; mere length of residence without concurrent circumstances involving the acquisition of a settlement on obtaining relief gave no right to a person to remain in the parish where he resided.

In 1846 it was enacted that no person should be removed nor any warrant granted for the removal of any

person from any parish in which such person has resided for five years (9 & 10 Vict. c. 66). In 1861 three years was substituted for five (24 & 25 Vict. c. 55); and only four years later one year was substituted for three (28 & 29 Vict. c. 79). Apart from these reductions of time in giving the status of irremovability, actual removals to the parish of settlement were narrowed by provisions giving to residence in any part of a union the same effect as a residence in any parish of that union (24 & 25 Vict. c. 55). On the other hand the time during which parish relief is received, or during which the person is in any poorhouse or hospital or in a prison, is excluded from the computation of time (9 & 10 Vict. c. 66).

The removability as well as the settlement of the family, *i.e.*, of the wife and unemancipated children, are practically subject to one and the same general rule. Wherever any person has a wife or children having another settlement, they are removable where he is removable, and are not removable from any parish or place from which he is not removable (11 & 12 Vict. c. 211).

It is to be borne in mind that no person exempted from liability to be removed acquires, by reason of such exemption, any settlement in any parish; but a residence for three years gives a qualified settlement (39 & 40 Vict. c. 61).

The cost of relief of paupers rendered irremovable is borne by the common fund of the union (11 & 12 Vict. c. 110, § 3) as union expenses (§ 6), and any question arising in the union with reference to the charging relief may be referred to and decided by the local government board (§ 4).

The statute of Elizabeth required overseers to account to justices for all moneys received by them under rules or otherwise, and all expenditure for the relief of the poor, and to deliver over balances to their successors (43 Eliz. c. 2, § 2). By the amendment of the poor laws in 1834 the duty of making payments was thrown chiefly on the guardians, leaving the overseers to assess and collect the rates out of which such payments are chiefly made. The accounts of expenditure and receipts by all parties, including officers of union and treasurers, form a very important part of poor-law administration. The duties, including the forms of books of account, are minutely prescribed by orders of the central board, and the accounts are examined and audited half-yearly by auditors appointed by the board in auditory districts, the auditing by justices having ceased. Full powers are given to the auditors to make this examination effectual and to allow and disallow accounts and items in them (see the Poor-Law Amendment Act, 1868, and Acts there recited).

It is to be observed that by various provisions in the poor-law Acts power has been given to raise money by borrowing. The Poor-Law Amendment Act 1835 authorizes applications for advances under several earlier Acts for building or enlarging workhouses or for purchasing land, and a subsequent Act authorizes the borrowing of money for payment of debts generally (5 & 6 Vict. c. 15).

The principal items comprised in the total amount expended in the relief of the poor in England and Wales during the years ending at Lady Day 1882 and 1883 are these:—

	1882.	1883.
1. Indoor maintenance.....	£1,831,595	£1,869,505

Adjusted cost of relief.....	£8,232,472	£8,353,292

¹ To be made in consequence of the payments from the metropolitan common poor fund exceeding the payments made to that fund during each year

The comparison between the two years shows that with the exception of the outdoor relief there has been an increase in each item of expenditure. In this respect the year 1883-84 forms no exception to its predecessors, for the out relief is the only item in which there has been any decrease of late years.

Bringing the expenditure down to a later period, the comparative cost of the half years ended at Lady Day 1883 and 1884 stood thus:—1883, in maintenance £982,586, out relief £1,269,700, total £2,252,286; 1884, in maintenance £978,287, out relief £1,226,730, total £2,205,017. Therefore the cost for the half year 1884 had decreased—the in maintenance by £4299, and the outdoor relief by £42,970. The average price of wheat per imperial quarter during the same half years was—1883, 40s. 11d.; 1884, 38s. 11d.

In the article LONDON tables have been given of the system of poor relief there. It must suffice here to notice that the cost of relief in the metropolis, comprising thirty unions, has increased since 1875. On the other hand the proportion which the cost of outdoor relief bears to the cost of in maintenance in the metropolis is continually decreasing. In 1883 the in maintenance was £586,933 and the outdoor relief £199,013. The expenditure for in and out relief in the metropolis for the Lady Day half years 1883 and 1884 stood thus—1883, £417,614; 1884, £425,310, an increase of £7696. In the parochial year 1883 the adjusted cost of relief was £2,172,294, being equal to a rate of 1s. 6½d. on the rateable value.

It is satisfactory to find that the adult able-bodied paupers have been steadily diminishing in numbers during the last four years, both among indoor and outdoor paupers. Comparing 1883 with 1873, it appears that there has been a diminution of 25,775, or no less than 20·6 per cent., in the mean number of adult able-bodied persons receiving relief, and, if we take into account the increased population, we find that the diminution has been 30·0 per cent. In the parochial year 1883 the mean number of adult able-bodied paupers was—indoor 21,558, outdoor 77,592, total 99,150. The above numbers do not include vagrants.

Although for many reasons it is considered desirable that as far as practicable out relief should be given in kind rather than in money, it will be seen by the following table for the parochial year 1883 taken from the unaudited half-yearly statements (and exclusive of relief given by the guardians in respect of school fees) how much more is given in money:—

Poor-Law Divisions.	Out-Door Relief.	
	In Money.	In Kind.
The metropolis.....	£156,272	£38,623
South-eastern.....	198,657	52,029
South-midland.....	193,353	34,606
Eastern.....	126,155	55,486
South-western.....	298,371	29,146
West-midland.....	254,989	36,378
North-midland.....	176,208	8,248
North-western.....	202,070	14,366
York.....	234,644	12,967
Northern.....	127,113	1,639
Wales.....	282,487	10,824
Total.....	£2,250,319	£294,312

The great difference which exists in the several divisions in the manner of administering out relief is apparent. In the eastern division (comprising Essex, Suffolk, and Norfolk) nearly one-third of the outdoor relief was given in kind; while in the northern division (comprising Northumberland, Durham, Cumberland, and Westmoreland) nearly the whole was given in money.

The cost per head of relief on the mean number was in 1883 £10, 13s. 6d.; in 1873 it was £8, 14s. 1d.

It may be stated here that, whilst in the metropolis the cost of outdoor relief was in 1883 little more than one-third of that of the in maintenance, the expenditure on out relief in the remainder of England, with the exception of the north-western division, was considerably in excess of that on in maintenance, being in Wales more than four and a half times as great.

The mean number of paupers relieved in 1883 was—indoor 182,932, and out paupers (inclusive of those chargeable to the poor rates who are in county and borough asylums or in licensed houses) 599,490, or a total mean number of 782,422, being a ratio of 29·6 per 1000 of the population. The mean number of paupers relieved in 1883 was smaller in proportion to the population by 101,266 (or 11·5 per cent.) than the mean number relieved in 1873, ten years before—a decrease, however, entirely owing to a reduction in the number of outdoor paupers.

Some remarkable fluctuations took place in the number of vagrants relieved during the ten years ending in 1883. In 1873 the mean number of this class of paupers was 2700. In 1881 it had risen to 6979, an increase of 158·5 per cent. In 1883 it had fallen to 4790. After the end of that parochial year it still further

decreased owing to the operation of the Casual Poor Act, 1882, extending the periods for which vagrants may be detained in casual wards.

The increased cost of relief is attributable to some extent to the fact that the proportion which the mean number of paupers relieved in the workhouse bears to the mean number of paupers of all classes is larger than it formerly was; but it is also attributed partly to expenses incurred in the erection of improved buildings, the substitution of paid officers for pauper help, and other similar items of expenditure incurred for the purpose of securing the more efficient administration of relief. The yearly cost per head on the mean number of outdoor paupers has diminished during the last few years, and was smaller during 1883 than in any other year since 1873 with the exception of the year 1880.

The poor rate is the fund from which the cost of relief is principally derived. The parochial taxation for this purpose in the statute of Elizabeth has been already noticed. As regards the subject matter of taxation the only subsequent absolute interference is in relation to saleable underwood, and also to rights of fowling, shooting, or taking game or rabbits, and of fishing, where severed from the occupation of lands, and to mines of every kind not mentioned in the Act (see the Rating Act, 1874). The statute of Elizabeth enforced what are called duties of imperfect obligation; for it was, as has been seen, a duty before that statute to relieve the poor and necessitous, and the provisions of that Act were adapted to the enforcing of those duties in the way in which they could be practically carried out by enabling the parish officers to tax the inhabitants, whose representatives those officers are, for the actual performance of the obligations.

The Act gives persons aggrieved by any such tax a right of appeal—a right which has been fully exercised as well as regulated and affected by much subsequent legislation. By the Parochial Assessment Act, 1836 (6 & 7 Will. IV. c. 96), closely following the poor-law amendment of two years before, no rate for the relief of the poor is of any force which is not made upon an estimate of the net annual value of the several hereditaments rated, that is to say, of the rent at which the same might reasonably be expected to let from year to year free of all usual tenant's rates and taxes, and tithe commutation rent charge, if any, and deducting therefrom the probable average annual cost of the repairs, insurance, and other expenses, if any, necessary to maintain them in a state to command such rent.

Nothing in the Act, however, altered or affected the principles or different relative liabilities according to which different kinds of hereditaments were previously liable. The statute of Elizabeth (extended in some respects as to places by 13 & 14 Charles II. c. 12) embraced two classes of persons subject to taxation—occupiers of real property and inhabitants in respect of personal property, although the rateability under the latter head was reluctantly conceded by the courts of law, and was in practice only partially acted upon. Inhabitants as such, in respect of ability derived from the profits of stock in trade or any other property, were, however, expressly relieved in 1840 by a temporary Act (3 & 4 Vict. c. 89), since continued from time to time. It is solely by expiring laws continuance Acts (the last Act extending to the end of 1885) that the vast amount of personal property is relieved from the poor rate. This exemption, and the principle on which it is based, of course forms an important element in all questions of local and in many of imperial taxation.

As regards occupiers of land and houses, the correct principles as to the persons liable to be rated were, after many erroneous views and decisions, established by the House of Lords in 1865 in the case of the Mersey docks. The only occupier exempt from the operation of the Act of Elizabeth is the crown, on the general principle that such liabilities are not imposed on the sovereign unless expressly mentioned, and that principle applies to the direct and immediate servants of the crown, whose occupation is the occupa-

tion of the crown itself. If there is a personal private beneficial occupation, so that the occupation is by the subject, that occupation is rateable. Thus for apartments in a royal palace, gratuitously assigned to a subject, who occupies them by permission of the sovereign but for the subject's benefit, the latter is rateable; on the other hand, where a lease of private property is taken in the name of a subject, but the occupation is by the sovereign or her subjects on her behalf, no rate can be imposed.

So far the ground of exemption is perfectly intelligible, but it has been carried a good deal further, and applied to many cases in which it can scarcely be said naturally, but only theoretically, that the sovereign or the servants of the sovereign are in occupation. A long series of cases have established that when property is occupied for the purposes of the government of the country, including under that head the police, and the administration of justice, no one is rateable in respect of such occupation. And this applies not only to property occupied for such purposes by the servants of the great departments of state and the post office, the Horse Guards, and the Admiralty, in all which cases the occupiers might strictly be called the servants of the crown, but to county buildings occupied for the assizes and for the judge's lodgings, to stations for the local constabulary, to jails, and to county courts where undertakings are carried out by or for the Government and the Government is in occupation; the same principles of exemption have been applied to property held by the office of works.

When the property is not *de facto* occupied by the crown or for the crown, it is rateable; and, although formerly the uses of property for public purposes, even where the crown was not constructively interested in the way above pointed out, was treated as a ground for exemption, it is now settled that trustees who are in law the tenants and occupiers of valuable property in trust for public and even charitable purposes, such as hospitals or lunatic asylums, are in principle rateable notwithstanding that the buildings are actually occupied by paupers who are sick or insane, and that the notion that persons in the legal occupation of valuable property are not rateable if they occupy in a merely fiduciary character cannot be sustained.

With respect to the particular person to be rated where there is a rateable occupation, it is to be observed that the tenant, as distinguished from the landlord, is the person to be rated under the statute of Elizabeth; but occupiers of tenements let for short terms may deduct the poor-rate paid by them from their rents, or the vestries may order such owners to be rated instead of the occupiers; such payments or deductions do not affect qualification and franchises depending on rating (Poor-Rate Assessment and Collection Act, 1869, and Amendment Act, 1882).

To be rated the occupation must be such as to be of value, and in this sense the word beneficial occupation has been used in many cases. But it is not necessary that the occupation should be beneficial to the occupier; for, if that were necessary, trustees occupying for various purposes, having no beneficial occupation, would not be liable, and their general liability has been established as indicated in the examples just given.

As to the mode and amount of rating it is no exaggeration to say that the application of a landlord-and-tenant valuation in the terms already given in the Parochial Assessment Act, with the deductions there mentioned, has given rise to litigation on which millions of pounds have been spent within the last half century, with respect to the rating of railways alone, although the established principle applied to them, after much consideration, is to calculate the value of the land as increased by the line.

The Parochial Assessment Act referred to (6 & 7 Will. IV. c. 96), comprising various provisions as to the mode of assessing the rate so far as it authorized the making of a valuation, was repealed in 1869, in relation to the metropolis, and other provisions made for securing uniformity of the assessment of rateable property there (32 & 33 Vict. c. 67).

The mode in which a rate is made and recovered may be concisely stated thus. The guardians appoint an assessment committee of their body for the investigation and supervision of valuations, which are made out in the first instance by the overseers according to specific regulations and in a form showing among other headings the gross estimated rental of all property and the names of occupiers and owners, and the rateable value after the deductions specified in the Assessment Act already mentioned, and as prescribed by the central board. This valuation list, made and signed by the overseers, is published, and all persons assessed or liable to be assessed, and other interested parties, may, including the officers of other parishes, inspect and take copies of and extracts from that list. A multitude of provisions exist in relation to the valuation and supplemental valuation lists. Objections on the ground of unfairness or incorrectness are dealt with by the committee, who hold meetings to hear and determine such objections. The valuation list, where approved by the committee, is delivered to the overseers, who proceed to make the rate in accordance with the valuation lists and in a prescribed form of rate book. The parish officers certify to the examination and comparison of the rate book with the assessments,

and obtain the consent of justices as required by the statute of Elizabeth. This consent or allowance of the rate is merely a ministerial act, and if the rate is good on the face of it the justices cannot inquire into its validity.

The rate is then published and open to inspection. Appeals may be made to special or quarter sessions against the rate, subject to the restriction that, if the objection were such that it might have been dealt with on the valuation lists, no appeal to sessions is permitted unless the valuation list had been duly objected to and the objector had failed to obtain such relief in the matter as he deemed to be just (see Union Assessment Acts).

In the metropolis a common basis of value for the purposes of government and local taxation is provided, including the promotion of uniformity in the assessment of rateable property. Provision is made for the appointment of an assessment committee by guardians or vestries, and for the preparation of valuation lists, and the deposit and distribution of valuation lists, and for the periodical revision of valuation lists. Appeals against the valuation list are heard by justices in special sessions, upon whom special limited powers are conferred. General assessment sessions, principally for appeals affecting the total of the gross or rateable value of any parish as being too high or too low as compared with other parishes, are appointed for hearing and determining appeals, and the lists are altered in accordance with their decisions. Those decisions may be questioned as in the case of decisions by courts of general or quarter sessions.

The valuation lists as approved by the assessment committee, or as altered on appeal, last for five years, and are conclusive evidence of gross and rateable value for the purpose of various specified rates, including the poor rate; and the poor rate is made by the parish officers in accordance with such valuation according to a form provided,—see Valuation (Metropolis) Act, 1869.

It is to be borne in mind that the amount raised by poor rates does not closely represent the amount actually expended on the relief of the poor. The rates are made in reference to the prospective amounts required, and various payments not connected with the maintenance of the poor are charged by various Acts of Parliament on the poor rate.

Payment of poor rates, and of the costs incurred, is enforced on complaints to justices, and by distress warrants and imprisonment in default. Special statutory provision is made for this mode of recovery.

In conclusion, while giving full credit to the admirable way in which the English poor-law system, and the principles on which it is based, have been and continue to be promulgated and explained by the central authority to the guardians and others concerned in the administration of the laws (an advantage in which poor-law administration stands out distinct from any other), we must add that a consolidation of the statute law relating to poor is much needed. Dr Burn, writing a hundred and twenty years ago, spoke thus:—"If it may be reasonable to advance further still in speculation, perhaps a time may come when it shall be thought convenient to reduce all the poor laws into one. The laws concerning the poor may not improperly be compared to their apparel. When a flaw is observed, a patch is provided for it, upon that another, and so on, till the original coat is lost amidst a variety of patch-work. And more labour and materials are expended (besides the clumsiness and motley figure) than would have made an entire new suit." Since that remote day the number of statutes has increased notwithstanding a multitude of repeals. At the present time the Acts of Parliament affecting the poor laws of England alone, exclusive of Scotland and Ireland, number upwards of one hundred and thirty, and by far the greater portion of them have originated since the amendment of the poor laws in 1834.

As to poor laws in other countries, the articles devoted to those countries must be referred to. It is to be observed that legal provision is made for paupers in every part of the United States. The poor-law system which obtains in the States in its general features is similar to that which prevails in England so far as regards the mode of raising the fund (viz., by way of rate) and the class of people to whom relief is afforded. Each district (commonly a town, county, or city) provides for its own poor. In some of the States paupers having no legal settlement are relieved by the State Government (1834). The prevalence

Consolidation of English poor laws desirable.

Poor-law systems of other countries.

of slavery in the Southern States until its abolition modified the system of relief.

The searching inquiry into the administration of the poor laws in 1832-34 was not confined to the United Kingdom or to the States of America. Returns were obtained through the foreign ministers, and the result as to Europe is thus comprehensively stated by Nassau Senior in 1835:—"A legal claim to relief exists in Norway, Sweden, Russia, Denmark, Mecklenburg, Prussia, Würtemberg, Bavaria, and the canton of Bern, but does not exist in the Hanseatic towns, Holland, Belgium, France, Portugal, the Sardinian states, Frankfort, Venice, Greece, or Turkey." In the north of Europe the great peculiarity of the system is stated to be "the custom of affording relief by quartering the paupers on the landholders in the country and on householders in the towns." Senior arrived at the conclusion that, in those portions of the Continent in which the English principle of acknowledging in every person a right to be supported by the public existed, the compulsory relief had not, except perhaps in the canton of Bern, produced evils resembling either in intensity or extent those then experienced in the United Kingdom, and that in the majority of the nations that had adopted it the existing system appeared to work well. The poor laws of Russia, however, if they could be called poor laws, were merely parts of her system of slavery.

The absence of poor laws in France, and the charitable establishments, many of them under state management, are noticed in the article FRANCE. Senior arrived at the conclusion that the comprehensive and discriminate system of public relief established in France in relation to these institutions was not so complete as in Belgium. For the poor there see BELGIUM, where benevolent and charitable institutions and hospitals, charity workshops and depôts of mendicity or workhouses, and the *bureaux de bienfaisance* are noticed. The power of expulsion *pour vagabondage* exercised as a matter of daily routine in France operates as a restraint on vagrancy, although having a wider range than the English vagrancy laws. The majority of the indigent who receive public relief in France are foreigners.

The beneficent, including eleemosynary, institutions of united Italy are treated of under that head in ITALY.

The "pauper colonies" of Holland, established in the first quarter of the present century (the first idea of which seems to have been derived from a colony of Chinese in Java), attracted public attention in England and Europe generally about the time the provision for the poor and the administration of the poor laws were under consideration, immediately before their reform in 1834. The object of the institutions in Holland was to remove those persons who were a burden to society to the poorest waste lands, where under judicious regulations they were enabled to the number of many thousands to provide for their own subsistence. It is remarkable that various schemes put forth in the 17th and 18th centuries for the reform of the British poor laws already cited teem with comparisons favourable to Holland. Sir Matthew Hale refers to the industry and orderly management prevailing in Holland and Flanders. Sir J. Child and others do the like.

Among various works on poor laws see Burn's *History* and the modern work of Sir G. Nicholls; Nassau Senior's *Poor Laws of European States*; Const's and Davis's treatises; Glen's *Poor-law Orders*; Reports of Poor-Law Commissioners; Reports of Poor-Law and Local Government Boards from 1834. (J. E. D.)

POPAYAN, a city of the republic of Colombia, capital of the state of Cauca, is situated in 2° 26' N. lat. and 76° 49' W. long., at a height of 5948 feet (E. André, 1876), on the banks of one of the head streams of the Cauca in the great plain in the heart of the cordilleras. It was founded by Belalcazar in 1538 on the site of an Indian settlement, and in 1558 it received a coat of arms from the

king of Spain and the title of "Muy noble y muy leal." Pope Paul III. made it a bishop's see in 1547. By means of its gold mines and its share in the commerce between Quito and the valley of the Magdalena Popayan became a large and flourishing city; but political disturbances and earthquakes (1827 and 1834) have reduced it to a place of 7000 to 10,000 inhabitants (8485 in 1870). It has a cathedral built by the Jesuits, several considerable churches, two seminaries founded about 1870 by French Lazarists (who occupy and have restored the old Jesuit convent), a mint, and a bank. The university was at one time celebrated; and the city is the birthplace of Caldas the astronomer and Mosquera the geographer.

The volcano of Purace, 20 miles south-east of the town, had according to Caldas a height of 17,000 feet, but André's measurement gave only 16,102 feet. From a vent 6 feet across at a height of 14,970 feet (Boussingault, 1831) steam and gas are discharged with violence sufficient to blow a man away like a straw. On the flanks of the mountain are several hot sulphurous springs and those of Coconuco are frequented by the Colombians.

POPE is the name given in England to a small freshwater perch (*Acerina cernua*), also called RUFFE, which is generally distributed in the rivers of central Europe and common in most fresh waters of England. It was first made known by Dr Caius, a keen observer who lived in the middle of the 16th century, and is well known by his work *De Canibus Britannicis*. He found the fish in the river Yar, and figured it under the name of *Aspredo*, the Latin translation of ruffe, which name refers to the remarkable roughness of the scales with which it is covered. In general structure, shape, and habits the pope resembles much the common perch, but rarely exceeds a length of seven inches, and differs in its coloration, which is olive-brown with irregular darker spots on the body and numerous blackish dots on the dorsal and caudal fins. It is most destructive to the fry of other fish, but in many parts of the country is esteemed as food. It spawns generally in the month of April.

POPE, ALEXANDER (1688-1744), was the most famous English poet of his century. His own century dwelt most upon his merits; the 19th century is disposed rather to dwell upon his defects, both as a poet and as a man, with a persistency and minuteness that more than counterbalance any exaggeration in the estimate formed when it was the fashion to admire his verse and treat his moral obliquity as a foible. Substantially, the best judgment of the two centuries is at one, only different sides are prominent in the bulk of current criticism. All are agreed that he was not a poet of the first rank, and nobody can deny that he did certain things in literature in a way that has been the despair of all who have since attempted the same kind of thing. The great point of difference lies in the importance to be assigned to such work as Pope's satires. The polemic against his title to the name of poet would be contemptible were it not that beneath the dispute about the name there is a desire to impress on the public a respect for the highest kinds of poetry. The 19th century takes the poet's mission more seriously than the 18th. Similarly with Pope's moral delinquencies. With the exception of some details recently brought to light with an industry worthy of a better subject, his contemporaries were as well aware of these delinquencies as we are now, only none but his bitter enemies were so earnest in denouncing them. "In this design," Johnson says in his comments on the *Dunciad*, "there was petulance and malignity enough, but I cannot think it very criminal." And this was the general verdict of his contemporaries about the poet's moral weakness. They knew that he was insincere, intriguing, touchy, and spiteful, but, as nobody was much harmed by his conduct, they could not think it very criminal. Perhaps his physical weakness made them

more indulgent to his elfish and sprite-like temper. But, apart from this, intriguing was the way of his world, a fact too much kept out of sight when Pope is denounced for his crooked ways in little matters, as if he had lived in our own straightforward and virtuous age.

If we are to judge Pope, whether as a man or as a poet, with human fairness, and not merely by comparison with standards of abstract perfection, there are two features of his times that must be kept steadily in view—the character of political strife in those days, and the political relations of men of letters. As long as the succession to the crown was doubtful, and political failure might mean loss of property, banishment, or death, politicians, playing for higher stakes, played more fiercely and unscrupulously than in modern days, and there was no controlling force of public opinion to keep them within the bounds of common honesty. Hence the age of Queen Anne is pre-eminently an age of intrigue. The government was almost as unsettled as in the early days of personal monarchy, and there was this difference that it was policy rather than force upon which men depended for keeping their position. Secondly, men of letters were admitted to the inner circles of intrigue as they had never been before and as they have never been since. A generation later Walpole defied them, and paid the rougher instruments that he considered sufficient for his purpose in solid coin of the realm; but Queen Anne's statesmen, whether from difference of tastes or difference of policy, paid their principal literary champions with social privileges and honourable public appointments. Hence men of letters were directly infected by the low political morality of the unsettled time. And the character of their poetry also suffered. The most prominent defects of our Augustan age in 19th-century eyes—the lack of high and sustained imagination, the genteel liking for "nature to advantage dressed," the incessant striving after wit—were fostered if not generated by the social atmosphere. The works of the serious imagination could not thrive in a fashionable society, feverishly interested in the daily chances of intrigue for place and power.

Pope was peculiarly fitted by nature to take the impress of his surroundings—plastic, sensitive, eagerly covetous of approbation. Affection and admiration were as necessary to his life as the air he breathed. "Pope was from his birth," Johnson says, "of a constitution tender and delicate, but is said to have shown remarkable gentleness and sweetness of disposition. The weakness of his body continued through his life; but the mildness of his mind perhaps ended with his childhood." Perhaps; but certainly to a much less degree with the friends who loved and honoured him. With them he was always more or less sweet and docile; his petulance and malignity were directed as by an instinct of self-preservation against those who balked him in his craving for admiration, a spiritual food literally and physically essential to the sustenance of his fragile being.

If Pope had been a man of more robust and self-sufficing constitution, he had one great advantage for resisting the spirit of his age. He was cut off by the religion of his parents from all public employment. His father was a Roman Catholic, a merchant in Lombard Street,¹ London, who retired from business with a small fortune in the year of the Revolution, and fixed his residence at Binfield in Windsor Forest. Pope was born at Lombard Street on

May 22, 1688, but his father's retirement to Binfield took place soon after his birth. The delicate child's book education was desultory and irregular. His father's religion excluded him from the public schools, if there was no other impediment to his being sent there. Before he was twelve he got a smattering of Latin and Greek from various masters, from a priest in Hampshire, from a schoolmaster at Twyford near Winchester, from another in Marylebone, from a third at Hyde Park Corner, and finally from another priest at home. "He thought himself the better," Spence says, "in some respects for not having had a regular education. He (as he observed in particular) read originally for the sense, whereas we are taught for so many years to read only for words." This helps to explain his attack on Bentley in the *Dunciad*. He afterwards learnt French and Italian, probably to a similar extent. As far as the sense was concerned, he could get a dilution of that at least in translations, for all poets of note—Greek, Latin, French, and Italian—had been translated into English verse in the course of the previous century. Of these translations the precocious boy availed himself voraciously, and by the age of twelve, when he was finally settled at home and left to himself, he was not only a confirmed reader, but an eager aspirant to the highest honours in poetry. When at school in London he had crept into Will's coffee-house to look at Dryden; he had lampooned his schoolmaster, and made a play out of Ogilby's *Iliad* for his schoolfellows; and, thinking himself the greatest genius that ever was, he retired to the solitude of the forest to write a great epic on a mythological subject, his hero being Alcander, a prince of Rhodes.

Nothing of Pope's was printed till 1709, when he was twenty-one. The detachment from contemporary life in London which his father's religion and retirement might have occasioned was prevented by one of the accidents of that position. Fortunately or unfortunately for him, there were among the Papist families near Binfield men capable of giving a direction to his eager ambition, men of literary tastes, and connexions with the literary world. These families held together as persecuted sects always do, and the family priests were mediums of communication.

Through some such medium the retired merchant's precocious son was brought under the notice of Sir William Trumbull, a retired diplomatist living at Easthampstead, within a few miles of Binfield. At Whiteknights, near Reading, lived another Roman Catholic, Mr Englefield, "a great lover of poets and poetry." Through him Pope made the acquaintance of Wycherley and Harry Cromwell, and Wycherley introduced him to Walsh, then of great renown as a critic. Thus the aspiring poet, before he was seventeen, was admitted to the society of London "wits" and men of fashion, and he was cordially encouraged as a prodigy. It may be doubted whether the company of these veteran relics of Restoration manners was much for the benefit of the moral tone of the bookish youth, who learnt from them to speak and write of the fair sex with a very knowing air of rakish gaiety. But he discussed poetry also with them, as was then the fashion, and soon under their influence his own vague aspirations received shape and direction.

Walsh's contribution to his development was the advice to study "correctness," as the one merit that was still possible for an English poet. But before he was introduced to Walsh, which was in 1705, he had already written the first draft of his "Pastorals," a subject on which Walsh was an authority, having written the preface to Dryden's translation of Virgil's *Eclogues*. Trumbull's influence was earlier and more extensive. For him may

¹ According to his own statement to Spence, his "Conversations" with whom are the chief authority for all the incidents of his youth. The value of the authority is much suspected. "He was more willing to show what his father was not than what he was," and Johnson accepted the statement that he was "a linen-draper in the Strand." Pope's vanity also renders doubtful in some details what he says about his own precocity.

fairly be claimed the credit of having been Pope's school-master in poetry. It was he who turned Pope's attention to the French critics, out of the study of whom grew the *Essay on Criticism*; he suggested the subject of *Windsor Forest*, and he started the idea of translating Homer. When Trumbull first saw the precocious boy, he was hard at work on his great epic. He had probably chosen his subject on the first impulses of his crude ambition, because it was an established maxim at the time that a great epic is the greatest work of which the human mind is capable. It says something for Pope's docility at this stage that he recognized so soon that a long course of preparation was needed for such a *magnum opus*, and began steadily and patiently to discipline himself. The epic was put aside and afterwards burnt; versification was industriously practised in shorter "essays"; and an elaborate study was made of accepted critics and models. When we look at the subjects of Pope's juvenile attempts, we cannot fail to be struck by a singular clearness of purpose in his poetic ambition, such as might have come from the judgment of the accomplished man of the world who was his adviser. He not only chose kinds of poetry in which there was an interest at the time, and a consequent likelihood of gaining attention and winning applause, but he had an eye to subjects that had not already been appropriated by great English poets, and in which success was still open to all comers. At the beginning of the 18th century Dryden's success had given great vogue to translations and modernizations. The air was full of theories as to the best way of doing such things. What Dryden had touched Pope did not presume to meddle with,—Dryden was his hero and master; but there was much more of the same kind to be done. Dryden had rewritten three of the Canterbury tales; Pope tried his hand at the *Merchant's Tale*, and the *Prologue to the Wife of Bath's Tale*, and produced also an imitation of the *House of Fame*. Dryden had translated Virgil; Pope experimented on the *Thebais* of Statius, Ovid's *Heroides* and *Metamorphoses*, and the *Odyssey*. He knew little Latin and less Greek, but there were older versions in English whose metre he could improve upon and from which he could get a clue to the sense; and, when the correspondents to whom he submitted his versions pointed out mistranslations, he could answer that he had always agreed with them, but that he had deferred to the older translators against his own judgment. It was one of Pope's little vanities—very venial in a nature requiring such support—to try to give the impression that his metrical skill was more precocious even than it was, and we cannot accept his published versions of Statius and Chaucer (published in "miscellanies" at intervals between 1709 and 1714) as indisputable evidence of his proficiency at the age of fifteen or sixteen, the date, according to his own assertion, of their composition. But it is indisputable that at the age of sixteen his skill in verse was such as to astonish a veteran critic like Walsh, and that his verses were handed about in manuscript and admired by men then in the foremost rank in literature. There is no better proof of his dexterity than his imitations, or rather parodies, of Chaucer, Spencer, Rochester, and Dorset, though dexterity is their only merit. His metrical letter to Cromwell, which Mr Elwin dates in 1707, when Pope was nineteen, is also a brilliant feat of versification, and has turns of wit in it as easy and spirited as any to be found in his mature satires. Pope was twenty-one when he sent the "Ode to Solitude" to Cromwell, and said it was written before he was twelve years old. He may have retouched this; in all probability he did; perhaps every line of it was written when he was twenty-one; but there is abundance of external evidence of his extraordinary precocity

as a metrician. He was vain enough to try to make it appear still more extraordinary than it was; but the attempt was hardly more puerile and comically superfluous than the solemn efforts of criticism to reduce his pretensions. They are too solidly founded to be shaken either by his own vain superstructure or by the outraged critic's vindictive undermining.

Precocious Pope was, but he was also industrious; and he spent some eight or nine years in arduous and enthusiastic discipline, reading, studying, experimenting, taking the advice of some and laughing in his sleeve at the advice of others, "poetry his only business," he said, "and idleness his only pleasure," before anything of his appeared in print. In these preliminary studies he seems to have guided himself by the maxim formulated (after a French model) in a letter to Walsh (written at the date he gives, or later) that "it seems not so much the perfection of sense to say things that have never been said before, as to express those best that have been said oftenest." His first publication was his "Pastorals." Tonson the bookseller had heard these pastorals highly spoken of, and he sent a polite note to Pope asking that he might have them for one of his miscellanies. They appeared accordingly in May 1709 at the end of a volume containing contributions from Philips, Sheffield, Garth, and Rowe, besides Pope's version of Chaucer's *Merchant's Tale*. We have not space to show what can be said on both sides about these artificial compositions, avowedly designed to represent the manners of an imaginary golden age, when men of "wit and refinement" were shepherds. The worst that can be said of them was said by implication in the *Guardian* in 1713, when a case, which was afterwards justified by Allan Ramsay, was made out for the representation of real English country life. Johnson, though he did not approve of pastorals in the abstract, said a word of common sense against exaggerated depreciation of Pope's attempt. Few persons are likely nowadays to put themselves in a position for making a fair historical estimate of Pope's pastorals. There was a passing fashion for the kind of thing at the time, and possibly he wrote them under the impression that they offered a new field for poetic ambition in English, not knowing or forgetting what had been done by Giles Fletcher and Milton. Or he may have thought that a great poet should begin as Virgil began with pastorals. At any rate his pastorals, though Johnson was right in remarking the "closeness of thought" shown in their composition, cannot be ranked high as poetry, however much superior to everything else written in a passing fashion.

Pope's next publication was the *Essay on Criticism*. "In every work regard the writer's end," is one of its sensible precepts, and one that is often neglected by critics of the essay, who comment upon it as if Pope's end had been to produce an original and profound treatise on first principles. His aim was much less lofty—being simply to condense, methodize, and give as perfect and novel expression as he could to floating opinions about the poet's aims and methods, and the critic's duties, to "what oft was thought but ne'er so well expressed." "The town" was interested in *belles lettres*, and given to conversing on the subject; Pope's essay was simply a brilliant contribution to the fashionable conversation. The youthful author said with delicious loftiness that he did not expect the sale to be quick because "not one gentleman in sixty, even of liberal education, could understand it." But he misjudged his audience. The town was fairly dazzled by it—such learning, such comprehensiveness of judgment, such felicity of expression, was indeed a marvel in one so young. Many of its admirers, doubtless, like Lady Mary Montague, would have thought less of it if they had not

believed all the maxims to be original; but people of fashion are seldom wide readers, and they gave Pope credit for much that they might have found, where he found it, in Quintilian, Rapin, and Bossu. "The truth is," Mr Elwin says, "that Addison, by his encomiums and authority, brought into vogue the exaggerated estimate entertained of the essay." Nothing could be more preposterously far from "the truth."

A better illustration could not be found of the critical vice that Pope censures of "forming short ideas" by attending to parts to the neglect of the whole. If the whole of Addison's paper is read, it stands out in its true colours as a kindly gentle attempt to throw cold water on the enthusiasm about a work which had been published for some months and was already, as the paper admits, "highly esteemed by the best judges." It is "a masterpiece in its kind"; but people expect too much from the kind—originality, for instance. And again, it is "a masterpiece in its kind," worthy of a place beside Roscommon's *Essay on Translated Verse* and Mulgrave's *Essay on the Art of Poetry*! Most exaggerated encomiums these! How kindly, too, the paper opens by giving prominence to trivial incidents in the essay, one or two passing strokes of satire at Blackmore and Dennis. Bad poets are given to detraction; they try to raise themselves by pulling down the reputation of their brothers in the art. A third of the whole paper is devoted to warning the young poet against a spirit of envy and detraction, all because he had thrown a stone in passing at two of the common butts of their generation. But this was Addison's kindness; he wished to give the promising youth a lesson against a bad habit. Read the whole paper (*Spectator*, No. 253) and judge.

The *Rape of the Lock* in its first form appeared in 1712 in *Linton's Miscellany*; the "machinery" of sylphs and gnomes was an afterthought, and the poem was republished as we now have it early in 1714. This was his first poem written on an inspiration from real life, from nature and not from books. A gentleman had in a frolic surreptitiously cut off a lock of a young lady's hair, and the liberty had been resented; Pope heard the story from his friend Caryl, who suggested that it might be a subject for a mock-heroic poem like Boileau's *Lutrin*. Pope caught at the hint; the mock-heroic treatment of the pretty frivolities of fashionable life just suited his freakish sprightliness of wit, and his studies of the grand epic at the time put him in excellent vein. The *Rape of the Lock* is almost universally admitted to be his masterpiece. English critics from his own time to the present have competed in lauding its airiness, its ingenuity, its exquisite finish. But M. Taine's criticism shows how much depends upon the spirit in which such humorous trifles are approached. The poem strikes M. Taine as a piece of harsh, scornful, indelicate buffoonery, a mere succession of oddities and contrasts, of expressive figures unexpected and grinning, an example of English insensibility to French sweetness and refinement. Mr Leslie Stephen objects on somewhat different grounds to the poet's tone towards women. What especially offends the French critic's delicate sense is the bearishness of Pope's laughter at an elegant and beautiful woman of fashion. Pope describes with a grin of amusement all the particulars of the elaborate toilet with which Belinda prepared her beauty for conquest, and all the artificial airs and graces with which she sought to bewitch the heart of susceptible man. The Frenchman listens without sympathy, without appreciation, with the contemptuous wonder of a well-bred man at clownish buffoonery. What is there to laugh at? Is she not preparing a beautiful picture? She cannot do this without powders and washes and paint-pots. What

is there to laugh at in this? It is mere matter of fact. The entire surrender of the female heart to little artifices for little ends does not apparently strike the Frenchman as ludicrous. Mr Stephen's laughter is checked by the serious thought that this is a misrepresentation of women, that women are spoken of in the poem as if they were all like Belinda. But the Frenchman is not moved to laughter at all; it would seem as if his delight in the finished picture, the elegant graceful captivating woman, hallowed every ingredient used in the making of it. Such are the differences in national humour. With English readers the change of manners since the fashionable party rowed up the river to spend a happy day at Hampton is more likely to be an obstacle to the enjoyment of Pope's airy extravagance.

In the interval between the first and the enlarged edition of the *Rape of the Lock*, Pope gave the finishing touches to his *Windsor Forest*, and published it in March 1713, with a flattering dedication to the secretary at war and an opportune allusion to the peace of Utrecht. This was a nearer approach to taking a political side than Pope had yet made. His principle had been to keep clear of politics, and not to attach himself to any of the sets into which literary men were divided by party. Although inclined to the Jacobite party by his religion, he was on friendly terms with the Whig coterie, so friendly indeed as to offend some of his co-religionists. He had contributed his poem "The Messiah" to the *Spectator*; he had written an article or two in the *Guardian*; and he wrote a prologue for Addison's *Cato*. But Pope's advances had not been received in a way to satisfy a man of his petulant and exacting temper. Mr Elwin is much mistaken in supposing that Addison helped to bring Pope into notice in the *Spectator*. We have seen how he treated the *Essay on Criticism*. When the *Rape of the Lock* was published, Addison is said to have praised it to Pope himself as *merum sal*, but he was much more guarded in the *Spectator*. There he dismissed one of the gems of English literature with two sentences of patronizing faint praise to the young poet whom he rejoiced to see getting on, coupled it with Tickell's "Ode on the Prospect of Peace," and devoted the rest of the article to an elaborate puff of "the pastorals of Mr Philips." We have only to look at the shameless puffery of the members of the little senate, not only in this article but throughout all the periodicals of the coterie, to see how little the young Mr Pope owed to Addison.

When Pope showed a leaning to the Tories in *Windsor Forest*, the coterie, so far from helping him, made insidious war on him—not open war but underhand war. Within a few weeks of the publication of the poem, and when it was the talk of the town, there began to appear in the *Guardian* a series of articles on "Pastorals." Not a word was said about *Windsor Forest*, but everybody knew to what the general principles referred. Modern pastoral poets were ridiculed for introducing Greek moral deities, Greek flowers and fruits, Greek names of shepherds, Greek sports and customs and religious rites. They ought to make use of English rural mythology—hobthrushes, fairies, goblins, and witches; they should give English names to their shepherds; they should mention flowers indigenous to English climate and soil; and they should introduce English proverbial sayings, dress, and customs. All excellent principles, and all neglected by Pope in *Windsor Forest*. The poem was fairly open to criticism in these points; there are many beautiful passages in it, showing close though somewhat professional observation of nature, but the mixture of heathen deities and conventional archaic fancies with modern realities is incongruous, and the comparison of Queen Anne to Diana was ludicrously

infelicitous. But the sting of the articles did not lie in the truth of the oblique criticisms. "The pastorals of Mr Philips," published four years before, were again trotted out. Here was a true pastoral poet, the eldest born of Spenser, the worthy successor of Theocritus and Virgil! Pope's pastorals have their defects, great defects, but it was an unkind cut to him to prefer such trash, and with such audacious emphasis. It was an affront, but so contrived that the sufferer could not retaliate without putting himself in the wrong, a mean backbiting provocation, the action of a critic "willing to wound and yet afraid to strike."

Pope took an amusing revenge, which turned the laugh against his assailants. He sent Steele an anonymous paper in continuation of the articles in the *Guardian* on pastoral poetry, reviewing the poems of Mr Pope by the light of the principles laid down. Ostensibly Pope was censured for breaking the rules, and Philips praised for conforming to them, quotations being given from both. The quotations were sufficient to dispose of the pretensions of poor Philips, and Pope did not choose his own worst passages, accusing himself of actually deviating sometimes into poetry. Although the *Guardian's* principles were also brought into ridicule by burlesque exemplifications of them after the manner of Gay's *Shepherd's Week*, Steele, misled by the opening sentences, was at first unwilling to print what appeared to be a direct attack on Pope, and asked Pope's consent to the publication, which was graciously granted.

The relations between Pope and his Whig friends were further strained by one or two little incidents about the same time. The truculent Dennis attacked both Pope's *Rape of the Lock* and Addison's *Cato*. Pope said nothing in his own defence, but—we were very obliging in those days—defended his friend Addison in a *Narrative of the Frenzy of John Dennis*. The attack was so coarse that Addison sent Steele to Dennis to disclaim all connexion with it. Then Pope asked his friend Addison's advice about the enlargement of the *Rape of the Lock*, and Addison advised him to leave it as it was, which advice the man who had asked it attributed to jealousy.

The estrangement was completed in connexion with Pope's translation of Homer. This enterprise was definitively undertaken in 1713. The work was to be published by subscription as Dryden's Virgil had been. Men of all parties subscribed, their unanimity being a striking proof of the position Pope had attained at the age of twenty-five. It was as if he had received a national commission as by general consent the first poet of his time. But the unanimity was broken by a discordant note. A member of the Addison clique, Tickell, attempted to run a rival version. There was nothing criminal in this, but it was an irritating continuation of the cold grudging treatment that Pope had all along received from the same quarter. Pope suspected Addison's instigation; Tickell had at least Addison's encouragement. Pope's famous character of Addison, if not true in the main, is at least a strictly fair description, inspired not by malignity but by legitimate resentment, if resentment is ever legitimate, of Addison's treatment of himself as he was rising into fame.¹ Pope afterwards claimed to have been magnanimous, and he is suspected of having supported this claim by petty inventions in his account of the quarrel. Magnanimity he could not fairly claim; but he did not attack without provocation.

The translation of Homer was Pope's chief employment

¹ A very different view is argued by Mr Elwin (with strange blindness, as the present writer thinks, to the cardinal circumstances here set forth), in his introductions to *Windsor Forest*, the *Essay on Criticism*, and the *Rape of the Lock*. See also Mr Leslie Stephen's *Pope*, and Mr Courthope's *Addison*.

for twelve years. The new pieces in the miscellanies published in 1717, his "Elegy on an Unfortunate Lady" and his "Eloisa to Abelard," were probably written some years before their publication. The *Iliad* was delivered to the subscribers in instalments in 1715, 1717, 1718, and 1720. For the translation of the *Odyssey* he took Fenton and Broome as coadjutors, who between them translated twelve out of the twenty-four books.² It was completed in 1725. The profitableness of the work was Pope's chief temptation to undertake it. He cleared more than £8000 by the two translations, after deducting all payments to coadjutors—a much larger sum than had ever been received by an English author before. Pope, with his economical habits, was rendered independent by it, and enabled to live nearer London. The estate at Binfield was sold, and he removed with his parents to Chiswick in 1716, and in 1718 to Twickenham, to the residence with which his name is associated. Here he held his little court, and was visited by his intimates Arbuthnot, Gay, Bolingbroke (after his return in 1723), and Swift (during his brief visits to England in 1726 and 1727), and by many other friends of political eminence. Martha Blount, after his mother's death in 1733, was occasionally domiciled in his house.

The translation of Homer established Pope's reputation with his contemporaries, and has endangered it ever since it was challenged. It was the Homer chiefly that Wordsworth and Coleridge had in their eye when they began the polemic against the "poetic diction" of the 18th century, and struck at Pope as the arch-corruptor. They were historically unjust to Pope, who did not originate this diction, but only furnished the most finished examples of it. Mr Leslie Stephen has asked in what the much abused pseudo-poetic diction consists. A long analysis would be required to answer the question in detail, but in substance it consisted in an ambition to "rise above the vulgar style," to dress nature to advantage—a natural ambition—when the arbiters of literature were people of fashion. If one compares Pope's "Messiah," or "Eloisa to Abelard," or an impassioned passage from the *Iliad*, with the originals that he paraphrased, one gets a more vivid idea of the consistence of pseudo-poetic diction than could be furnished by pages of analysis. But Pope merely used the established diction of his time. A passage from the *Guardian*, in which Philips was commended as against him, shows in a single example the great aim of fashionable poets in those days. "It is a nice piece of art to raise a proverb above the vulgar style and still keep it easy and unaffected. Thus the old wish, 'God rest his soul,' is very finely turned:—

"Then gentle Sidney liv'd, the shepherd's friend,
Eternal blessings on his shade attend."

Pope would have despised so easy a metamorphosis as this, for, just as dress is often valued for what it cost the wearer, so the poetic dress of nature was esteemed in proportion to the poet's labour and ingenuity in devising it. The work of his coadjutors and imitators in the *Odyssey* may be distinguished by this comparative cheapness of material. Broome's description of the clothes-washing by Nausicaa and her maidens in the sixth book may be compared with the original as a luminous specimen.

The year 1725 may be taken as the beginning of the third period of Pope's career, when he made his fame as a moralist and a satirist. In point of sheer literary power the works then composed are his greatest, but the subjects chosen belong essentially to the lower levels of poetry. Why did Pope, when his independence was secured and he was free to choose, "take to the plains,"

² 1, 4, 19, and 20 are by Fenton; 2, 6, 8, 11, 12, 16, 18, 23 by Broome.

to use Wordsworth's phrase, "when the heights were within his reach"? His choice was determined partly by character and partly by circumstances. It may be doubted whether Pope had the staying power necessary for the composition of a great imaginative work, whether his crazy constitution would have held together through the strain. He toyed with the idea of writing a grand epic. He told Spence that he had it all in his head, and gave him a vague (and it must be admitted not very promising) sketch of the subject and plan of it. But he never put any of it on paper. He shrank as with instinctive repulsion from the stress and strain of complicated designs. Even his prolonged task of translating weighed heavily on his spirits, and this was a much less formidable effort than creating an epic. He turned rather to designs that could be accomplished in detail, works of which the parts could be separately laboured at and put together with patient care, into which happy thoughts could be fitted that had been struck out at odd moments and in ordinary levels of feeling.

The *Dunciad* (1728) was the first work of the new period. Circumstances turned him to satire when he was free from the *Odyssey*, and from his edition of Shakespeare, a bookseller's commission completed in the same year. Young's satire, *The Universal Passion*, had just appeared and been received with more enthusiasm than anything published since Pope's own early successes. This alone would have been powerful inducement to Pope's emulous temper. Swift was finishing *Gulliver's Travels*, and came over to England in 1726. The survivors of the Scriblerus Club—Swift, Pope, Arbuthnot, and Gay—resumed their old amusement of parodying and otherwise ridiculing bad writers, especially bad writers in the Whig interest. A volume of their *jeux d'esprit* was published in 1727. According to Pope's own history of the *Dunciad*, the idea of it grew out of this. Among the miscellanies was a "Treatise on the Art of Sinking," in which poets were classified, with illustrations, according to their eminence in the various arts of debasing instead of elevating their subject. No names were mentioned, but the specimens of bathos were assigned to various letters of the alphabet, most of them taken at random. But no sooner was the treatise published than the infatuated scribblers proceeded to take the letters to themselves, and in revenge to fill the newspapers with the most abusive falsehoods and scurrilities they could possibly devise. "This gave Mr Pope the thought that he had now some opportunity of doing good, by detecting and dragging into light these common enemies of mankind," who for years had been anonymously aspersing almost all the great characters of the age.

The truth probably lies between this account and that adopted by those who take the worst view of Pope's character. This is that he was essentially vindictive and malignant, and that, as soon as his hands were free from Homer, he proceeded to settle old scores with all who had not spoken as favourably as he liked about himself and his works. The most prominent objects of his satire can be shown to have given him personal offence—Theobald, Cibber, Dennis, Lintot, and others. This indeed was avowed by Pope, who claimed that it was their attacks on himself that had given him a right to their names. We may admit that personal spite influenced Pope at least as much as disinterested zeal for the honour of literature, but in the dispute as to the comparative strength of these motives, a third is apt to be overlooked that was probably stronger than either. This was an unscrupulous selfish love of fun, and delight in the creations of a humorous imagination. Certainly to represent the *Dunciad* as the outcome of mere personal spite is to give an exaggerated

idea of the malignity of Pope's disposition, and an utterly wrong impression of the character of his satire. He was not a morose, savage, indignant satirist, but airy and graceful in his malice, writing more in fun than in anger, revengeful perhaps and excessively sensitive, but restored to good-humour as he thought over his wrongs by the ludicrous conceptions with which he invested his adversaries. We do not feel the bitterness of wounded pride in his writings, but the laughter with which that pride was consoled. He loved his own comic fancies more than he hated his enemies. His fun at the expense of his victims was so far cruel that he was quite regardless of their sufferings, probably enjoyed them; but it was an impish and sprite-like cruelty, against which we cannot feel any real indignation because it is substantially harmless, while its ingenious antics never fail to amuse. Even when he exults in the poverty and material distresses of his victims, the coarseness of the matter is redeemed by the irresponsible gaiety of the manner. Such things should not be taken too seriously, if a Scotsman may say so. Further, even if Pope is regarded as a bitter malignant, it must be with two important qualifications. His plea that he was never the aggressor in a quarrel, in spite of all Mr Elwin's special pleadings to the contrary, was a truthful plea, though his sensitiveness to criticism was such as to make him fancy slights, and the withholding of praise where praise was due would have been construed by him as a positive offence. And his literary conscience was so strong that not one of his attacks on literary grounds was unjust. Pope was a most generous critic of real merit. The only doubtful exception is the case of Bentley, whom he satirized in the reconstruction and enlargement of the *Dunciad* made in the last years of his life at the instigation, it is said, of Warburton. Looked at apart from personal questions, the *Dunciad* is the greatest feat of the humorous imagination in English poetry.

There was much more of unjust judgment in Pope's *Satires and Epistles of Horace Imitated*, published at intervals between 1733 and 1738, because in them he oftener wrote of what he did not personally know, and was the mouthpiece of the animus of his political friends. These friends were all in opposition to Walpole, who was then at the height of his power, and the shafts of Pope's satire were directed at the adherents of the great minister. Pope's satires give the concentrated essence of the bitterness of the opposition. We see gathered up in them the worst that was thought and said about the court party when men's minds were heated almost to the point of civil war. To appreciate fully the point of his allusions requires of course an intimate acquaintance with the political and social gossip of the time. But apart from their value as a brilliant strongly-coloured picture of the time Pope's satires have a permanent value as literature. It is justly remarked by Pattison¹ that "these *Imitations* are among the most original of his writings." The felicity of the versification and the diction is universally admired.

The *Essay on Man* (1732–34) was also intimately connected with passing controversies.² It belongs to the same intellectual movement with Butler's *Analogy*—the effort of the 18th century to put religion on a rational basis. But Pope was not a thinker like Butler. The subject was suggested to him by Bolingbroke, who is said also—and the statement is supported by the contents of his posthumous works—to have furnished most of the arguments. Pope's contribution to the controversy consisted in brilliant epigram and illustration. In this di-

¹ In his incomparable edition of the *Satires and Epistles*.

² See Pattison's edition of the *Essay on Man*.

dactic work, as in his *Essay on Criticism*, he put together on a sufficiently simple plan a series of happy sayings, separately elaborated, picking up the thoughts as he found them in miscellaneous reading and conversation, and trying only to fit them with perfect expression. The want of logical coherence in his system was shown by the very different interpretations put upon it. Dealing as it did in incomparably brilliant fashion with a subject of living interest, the *Essay* at once attracted attention both at home and abroad, and Pope was attacked by a Swiss professor as an ally of the freethinkers. But a champion of his orthodoxy was found in Warburton. Pope was so delighted with the pugnacious paradoxist's reply to De Crousaz that he made Warburton's acquaintance. The readiness with which Pope allowed Warburton to take possession of himself and his works in his old age was not a symptom of senile weakness. It was an act of that characteristic business-like acuteness which he showed throughout in the management of his reputation. He saw that as long as Warburton was the authorized commentator on his works there was not likely to be any lack of critical debate about him and about them.

The *Essay on Man*, which may be said to contain the essence of the thought of men of the world in his generation on its subject—such was the poet's skill and judgment in collecting the substance of floating opinion—was announced by Pope as part of a system of "pieces on human life and manners." Whether Warburton was authorized or not in his sketch of Pope's intentions, the so-called *Moral Essays* (published at intervals between 1731 and 1735) which Warburton connected with the general plan have each an independent interest. They contain some of the most brilliant of Pope's satirical portraits, and his famous theory of "the ruling passion." If space permitted it might easily be shown that in this theory Pope proved himself a better psychologist than Macaulay, who subjects it to much misunderstanding and ridicule.

Pope died on the 30th May 1744, and was buried in the church of Twickenham. His own ruling passion was what a poet of his generation described as the universal passion, the love of fame. Under the influence of this passion he tried to support his reputation by intrigues such as the statesmen of his time used in climbing the ladder and keeping themselves in place. He had no moral scruple where this was concerned—everything gave way before the ruling passion. For some of these intrigues, so incongruous with our idea of a poet's character, he has suffered severe retribution. Especially of late years he has been violently denounced as little better than a common swindler for his petty manoeuvres in connexion with the publication of his letters—letters designed to exhibit him as a pattern of friendship, magnanimity, and all the virtues. These manoeuvres, which were first tracked with great patience and ingenuity by Mr Dilke,¹ are too intricate to be recorded in short space. This, in effect, is what he seems to have done. He collected his letters from his friends, retouched them, changed dates and passages to suit the picture of himself which he wished to present, deposited the collection thus manipulated in the safe-keeping of the earl of Oxford, then sent a printed book of them to Curll, and intrigued to make it appear that they had been fraudulently published without his consent. It was a ridiculously petty action, but to characterize it as Mr Elwin has done will be fair when it is customary to use similar language about the intrigues of statesmen and diplomatists. To apply it to Pope at present is not to call a spade a spade, but a molehill a mountain. Recent revelations have not affected by one iota Johnson's judgment of his character. The man who

"played the politician about cabbages and turnips," and "hardly drank tea without a stratagem," was not likely to be straightforward in a matter in which his ruling passion was concerned. Against Pope's petulance and "general love of secrecy and cunning" have to be set, in any fair judgment of his character, his exemplary conduct as a son, the affection with which he was regarded in his own circle of intimates, and many well-authenticated instances of genuine kindness to persons in distress. (W. M.)

POPEDOM.² Both the ecclesiastical and the temporal authority formerly exercised and still claimed by the popes of Rome profess to be of divine appointment, appealing in the first place to the language of the New Testament, and in the next to the tradition of the church, handed down, as it is asserted, in unbroken continuity from apostolic times to the present age. According to the theory thus put forth, Peter the apostle was indicated by Christ Himself as superior to the rest of the twelve in faith and spiritual discernment, and as the one of the number whom it was His design to invest with special pre-eminence. In like manner, the church itself which Peter was afterwards to found and to preside over was predestined to a like superiority among other churches, while his personal superiority was to be vested in perpetuity in his successors. In conformity with this divine design Peter, accompanied by Paul, went to Rome after Christ's death, and founded there a church over which he presided as its bishop for twenty-five years,—from the first year of the reign of Claudius, 41 A.D., to 67 A.D.,—eventually suffering martyrdom in the same year and on the same day as St Paul, in the persecution under Nero. And, if we accept the records preserved in the Roman Church, we shall believe that St Peter's successors, so long as Christianity was the object of state persecution, continued heroically to encounter the same glorious fate, the distinction of martyrdom being assigned in the Roman calendar to all but two of the bishops of Rome from Linus to Eusebius (see list at conclusion of article).

In dealing with a subject in which the evidence is frequently ambiguous and conflicting, and sometimes of more than doubtful genuineness, and with a period of much obscurity, no amount of research will often serve to point to more than a conjectural conclusion. But, inasmuch as it is on the basis of the assumptions involved in the above theory that the claims of the Church of Rome mainly rest, it will be desirable to state, as concisely as possible, the main facts and arguments on which those who deny these assumptions ground their contrary opinion.

The question whether or no St Peter was designed for pre-eminence among the apostles resolves itself, it is evident, into one of New Testament criticism; but from the time of Origen, who visited Rome early in the 3d century, when the theory first began to be put forward, there has always been a certain section in the church who have distinctly repudiated the affirmative assumption. "For if," says Origen, "you hold that the whole church was built by God on Peter alone, what will you say concerning John, the son of thunder, and each of the other apostles?" (Migne, *Patrologia Græca*, xiii. 397). Next, as regards the evidence for St Peter's presence in Rome and lengthened labours there, as the head of a Christian congregation, it is maintained by the great majority of Protestant scholars that there is no proof that he was ever in Rome at all; that the "Babylon" referred to in his first epistle (ch. v. 13) is really the distant city of the

² The design of the present article is simply to give the main outlines of the history of the Papacy as an institution; the details connected with the personal history of each pontiff will be found under the respective names of the different popes. The dates immediately after the name of each pope denote the period of his pontificate.

East; and that, even if his presence in Rome be admitted, his arrival there must have been long subsequent to that of his brother apostle, and his labours altogether subordinate in importance,—conclusions supported by the complete silence observed in the Acts of the Apostles respecting both him and his work in the capital of the empire. On the other hand, it is urged that, as no known tradition assigns the martyrdom of Peter to any other place than Rome, every allusion to that event is implicitly an argument for his visit to the capital; and, generally speaking, it may be said that the most recent and authoritative research seems to point to the conclusion that he both visited Rome and taught there, but that his labours were carried on in a spirit of rivalry, not to say antagonism, to those of Paul, being bestowed exclusively on a Judaizing church, while those of his fellow-apostle were devoted to the Gentile community. Of the important feature which harmonizes perfectly with these conclusions—namely, that the Church of Rome, attaching itself directly to the church at Jerusalem, became the depositary of a Jewish-Christian rather than of a Pauline tradition—there can be no doubt whatever.

The Jews
at Rome.

The existence of a considerable poor Jewish element in Rome as early as the latter half of the 1st century is attested by numerous facts and allusions in the classical writers. The Jews were everywhere actively engaged in commercial pursuits, and formed an influential section in all great centres. Josephus tells us that, when on one occasion the Jews of Palestine presented a petition to the emperor Augustus, it was supported by no less than eight thousand of their countrymen resident in the capital. The chief quarters of this Jewish colony were in the Trastevere, about the base of the Janiculum; and its members were distinguished by the fidelity with which they cherished their national customs and beliefs. Both Rome and the Jewish community in its midst must accordingly have appeared a field of primary importance in the work of evangelization; and it is evident that the questions raised by the claims of Christianity would there be discussed with the greatest ardour, and the most strenuous endeavours be made to bring them to an ultimate issue. That such was really the case is sufficiently proved by a well-known passage in Suetonius, who relates that about the middle of the 1st century there were constant riots among the Jewish population, their ringleader being one "Chrestus," and that Claudius in consequence expelled them from the city. There is no reason for supposing that this section of the community would be estranged to any great degree, by the pursuits and associations of their daily life, from those by whom they were surrounded. The influences that then pervaded alike the Roman literature, culture, and civilization were mainly Greek, and the Jewish element was no less affected by these influences than the Latin. Greek, again, was the ordinary medium of commercial intercourse throughout the Roman world, and the Jew was largely engaged in commerce. Greek therefore had, except in the Syrian provinces, become the language of his daily life, as it had long been that of his sacred books read aloud in the synagogues, and of the annals of his race as recorded by the national writers.

Passage
in Suetonius.

The importance of the passage above referred to in Suetonius, of which the very inaccuracy which it embodies is in itself highly significant, has perhaps hardly been sufficiently recognized, for it not only records an important fact but it sheds light on subsequent history. It enables us to understand that, when the Jewish population was permitted to return to Rome, its members, whether adherents of the national faith or converts to the new, would, in common with the whole Christian community,

feel the necessity of extreme caution lest their religious observances or their religious differences should again attract the notice of the Roman magistrate and expose them to fresh persecution. Of this character would appear to be the sentiments indicated in the epistle of Clemens Romanus (supposed by some to have been the same with the Clemens whose name is inserted as that of the third bishop of Rome) when he refers to the sudden and repeated "calamities and adversities which are befalling us"—a passage generally interpreted as having reference to the persecution under Nero and the impending persecution under Domitian (Lightfoot, *Append.*, p. 267). In such considerations as these we may fairly consider that we have a reasonable explanation of the fact that during the first two centuries of its existence we hear so little of the Christian church in Rome.

With such considerations before us, it is scarcely necessary to point out that Greek was also the language of the early Christian church in Rome. In whatever proportions, therefore, that church was composed of Christianized Jews or of Christianized pagans, its records would naturally be, as we find them to have been, in the Greek language. Hegesippus, "the father of church history," makes a statement which is generally understood to imply that, being in Rome in the time of Anicetus (bishop 155¹–168 A.D.), he made a list of the bishops of the see. This list is not extant; but in Irenæus, who wrote his *Adversus Hæreses* a few years later, we have another Greek list of twelve bishops, which shows the succession accepted at Rome in the time of Eleutherius, the contemporary of Irenæus, and at the head of which stand the names of both Peter and Paul. To these lists are to be added two other Greek lists, the one in the *Chronicon* of Eusebius, the other in the *Ecclesiastical History* of the same writer. Of these, the former extends from Peter to Gaius (the last bishop before the Diocletian persecution), and gives the periods of office. It is derived from the Armenian translation, but is not contained in the version by Jerome. The first Latin list, the *Catalogus Liberianus*,—supposed by Mommson to have been derived from the *Chronicon* of Hippolytus, bishop of Portus, and to have been in turn the original from which the *Catalogus Felicianus* (the oldest existing version of the *Liber Pontificalis*,—see *infra*) was taken,—is so called because it was compiled in the episcopate of Liberius, who succeeded 352 A.D. We have also two other Latin lists of some authority, in Augustine (*Epist.* 53; Migne, *Patrol.*, xxxiii. 195) and in Optatus (*De Schism. Don.*, ii. 3).

Earliest
lists of the
Roman
bishops.

It is undeniable that in all the foregoing lists there are considerable discrepancies. The Liberian catalogue gives us a certain "Cletus," as the immediate predecessor of Anacletus; scholars like Mommson and Lipsius are divided in opinion as to whether Anicetus was the predecessor or the successor of Pius; while, as regards the duration of each episcopate, there are equally important discrepancies. But difficulties like these cannot justly prejudice our acceptance of the general tradition with which they are associated; they are rather to be looked upon as supplying valuable incidental evidence with respect to the status of the Roman episcopate; and, while the lists themselves prove, on the one hand, that before the termination of the 3d century the office was held to be of such importance that its succession was a matter of interest to ecclesiastics living in distant sees, the variations that the lists present indicate not less clearly that the Roman bishopric at this period could not have held that position in relation to the church—the parallel to that of the

¹ For this date see article "Pope" in Smith's *Dict. of Christian Antiquities*, p. 1657.

imperial office in the empire—claimed for it by writers like Bellarmine.

The comparative history of institutions would, in itself, incline us to look for a less precise and exalted conception of the office, as discharged by these early bishops, than when, after a lapse of centuries and a succession of varied experiences, its duties and responsibilities had become defined and developed; but it is also a fact of considerable significance that those who were elected to the office from the time of Clement were for the most part men whose very names would probably not have survived but for their appearance in these lists, and that, even when, in one or two instances, their individual careers emerge from the general obscurity, they themselves appear as speaking and acting in a manner which seems hardly compatible with those exalted prerogatives which, as some maintain, were inherent in the office from its first commencement. In the recently recovered portion of the epistle of Clemens Romanus, above cited, it is, for example, highly significant to find that the letter purports to emanate, not from the "bishop of Rome," but from "the church at Rome," and to find again that, even so late as the 2d century, this letter is in like manner referred to as emanating from the community, and not from the individual. This feature, indeed, is not a little suggestive with respect to the development of the Roman supremacy. While the letter is wanting in anything that implies any special pre-eminence on the part of the Roman bishop, it is at the same time characterized by a certain admonitory tone, such as could hardly have been assumed if the community by whom it was sent had not been held to possess a recognized superiority over the community to whom it is written, but this superiority is not greater than would naturally belong (notwithstanding their common founder) to the church in imperial Rome as contrasted with the church at subject Corinth,—to the church of the august capital from whence emanated the laws which governed the empire and the church of the fallen city which, two centuries and a half before, the Roman arms had well nigh effaced from existence.

If again we accept as genuine the evidence afforded in those seven letters of Ignatius which most critics are disposed to accept as genuine, the relations of the Roman Church to the other churches of the empire appear to be of the same character. Ignatius, when on his way to Rome (probably early in the 2d century) to suffer martyrdom, addressed a letter to the Christian community in that city. In this letter there is again an equally direct reference to a certain primacy of the church in Rome, which is addressed as "she who hath the presidency in the place of the region of the Romans." But this expression is immediately followed by a definition of this primacy which is altogether incompatible with the theory that it is derived from the episcopal succession in the church; it is spoken of as founded upon sentiments of Christian fellowship, with the additional considerations attaching to the dignity and superior advantages belonging to the church of the capital.

The conclusion to which the foregoing evidence points is again strongly confirmed by the general fact that, as each new pretension on the part of the Roman see was put forward, it was called in question and repudiated by some one or other section of the Christian community.

An obscure and doubtful passage in Irenæus (*Adv. Hæres.*, bk. iii. c. 3) testifies, at most, to nothing more than a fuller recognition of the primacy of the Roman Church, while in the same writer, who, it will be remembered, was bishop of the church at Lyons, we have a notable instance of a distinct repudiation of the claims of the Roman bishop to dictate to the bishops of other dioceses. This

was on the occasion of a sentence of excommunication which VICTOR I. (c. 190–202 A.D.) had pronounced upon certain bishops in the province of Asia Minor,¹ on account of their refusal to celebrate Easter at the particular time enjoined by the church in Rome. Victor appears not to have had recourse to this extreme measure until after he had consulted with his episcopal brethren in Palestine, Pontus, Gaul, and Corinth; but Irenæus, notwithstanding, remonstrates boldly with him on the rigour of his proceeding, and on the impolicy of thus cutting himself off from an important section of the church on a mere matter of ceremonial observance. We find again Tertullian, who during his residence in Rome had acquired a certain practical knowledge of the administrative characteristics of its church, implicitly intimating his disapproval in his treatise *De Pudicitia* (sec. i.) of the assumption by the Roman bishop of the titles of "pontifex maximus" and "episcopus episcoporum"; in another of his treatises (*De Virgin. veland.*;² Migne, *Patrol.*, pp. 767–8), he distinctly impugns the claim made by ZEPHYRINUS (202–218) of a certain superiority in the Roman see derived as a tradition from St Peter.

The evidence with which we are presented for the rest of the 3d century is of a similar character. CALLISTUS (218–223), the successor to Zephyrinus, was originally a Christian slave in Rome during the bishopric of Victor, who (if we accept the narrative of Hippolytus) had been sent on account of his turbulence and dishonest practices to the mines in Sardinia. Victor, who was acquainted with the circumstances of his career, deemed him, notwithstanding, so little deserving of commiseration that, when, through the influence of Marcia, the mistress of the emperor Commodus, he had succeeded in bringing about the liberation of a certain number of Callistus's Christian fellow-sufferers in Sardinia, he did not include in the list the name of Callistus himself. The latter, however, managed to regain his freedom, and ultimately himself became bishop of Rome. During his brief episcopate his administration, as well as that of his predecessor Zephyrinus, was unsparingly criticized by Hippolytus, the well-known bishop of Portus. Against Callistus Hippolytus alleges the greatest laxity in the admission of candidates to ecclesiastical orders, and also undue connivance at marriages dishonourable to those professing the Christian faith; while Zephyrinus is depicted as a man of but little intelligence and of ignoble aims. It is evident that when a suffragan bishop could venture thus to criticize his metropolitan the authority wielded by the latter, even in his own diocese, was very far from meeting with unquestioning obedience.

The foregoing evidence, together with many other similar facts which cannot here be enumerated, points clearly to two important conclusions: first, that in the course of the 2d and 3d centuries the Church of Rome began to put forth unprecedented claims to a certain superiority among other churches; and, secondly, that these claims not unfrequently encountered considerable opposition as novel and unjustifiable.

The circumstances which contributed to bring about their ultimate establishment were various. The Roman Church itself had, from the first, been associated with that severer type of Christian belief which had its chief seat at Jerusalem; and, after the Holy City and its temple were

¹ An expression which, it must be noted, is to be understood with considerable qualification as applied to the Roman province.

² The evidence afforded in the above two treatises carries the greater weight in that they were not written until after Tertullian had become a convert to the austere tenets of Montanism, when he must have been all the more inclined to favour the type of Christianity which then prevailed at Rome.

alike razed to the ground by Titus (70 A.D.), much of the reverence which had belonged to Jerusalem was transferred to Rome. In relation to the episcopal office itself, again, it is to be noted that the general conception of its functions underwent, at this period, considerable change. On this point a passage in Jerome (*Ad Tit.*, i. 7) is of special significance. He here expressly attributes the institution of the episcopal order to the necessity which had arisen of repressing the numerous schisms in the church; and he goes on to observe that bishops would consequently do well to bear in mind that their office, with its involved authority over presbyters, was to be regarded rather as the result of custom and tradition than of divine appointment. As regards any special supremacy attaching to the Roman episcopate, the evidence afforded by another passage in Jerome is not less notable. In one of his most important letters (*Ad Rusticum*; Migne, *Patrol.*, xxii. 932) he fully recognizes the expediency and value of a central supreme authority, vested in a single individual. In support of his position he adduces examples from the animal kingdom, from the imperial power, from the judicial power, from the military power, and then goes on to say, "so again each church has its one bishop, its one arch-presbyter, its one archdeacon, every ecclesiastical grade relying on its leader," but to the clenching example, derivable from the supreme pontiff himself, no reference is made. It seems, accordingly, an inevitable inference that by one of the greatest of the Latin fathers, writing at the close of the 4th century, the Roman theory of the popedom was unrecognized. But the circumstance which perhaps most conduced to the acceptance of the papal pretensions was the creation of a new office in the ecclesiastical organization, that of the metropolitan. So long as Christianity was the religion only of an obscure sect, or of a persecuted minority in the Roman state, lying also under the suspicion of political disaffection, it probably sought to avoid attracting further attention to itself by any elaborate attempt at organization. At the same time the political organization of the empire, from its long established and universally recognized territorial divisions, its system of intercommunication, and its arrangement of the executive power, must have obviously seemed to furnish the most practicable outlines for the administration of a great and growing ecclesiastical community. The chief cities or *metropoleis* of the several Roman provinces were accordingly from the first selected as the seats of the principal Christian churches—Antioch, Corinth, Ephesus, and Thessalonica respectively representing the chief ecclesiastical centres of Syria, Achaia, Asia, and Macedonia. And when, again, under Constantine and his successors, the distribution of civil authority was further modified by the creation of four patriarchates, subdivided into twelve "dioceses" or major provinces, these changes were soon followed by corresponding modifications on the part of the church organization. In this manner we are able to understand how it is that we find the bishop of Rome successively assuming, as in the pontificates of Fabianus and Cornelius, the more extended authority of a metropolitan,¹ and, as in the days of Julius I. and Siricius, the authority of a patriarch.

But no external event exercised a more potent influence on the early history of the Roman Church than the removal of the seat of imperial power to Constantinople (330). For more than a century from that event it was not a little doubtful whether the patriarch of "Nova Roma" might not succeed in asserting an authority to which even the Western pontiff might be compelled to

defer. It became accordingly an object of primary importance with the latter to dissociate as far as possible in the mind of Christendom the notion of an ecclesiastical supremacy derived, like that at Constantinople, mainly from the political importance of the capital from the conception of that supremacy which he himself claimed as the representative of the inalienable authority and privileges conferred on St Peter and his successors. For such a policy an additional motive was created by the predilection shown by Constantine for his new capital, and the conviction which he is said to have entertained that the days of ancient Rome were numbered.² From henceforth it was the key-note to the utterances of the Roman primate that his supremacy, as a tradition from apostolic times, could never depart from him and his successors, and that, as representing the authority of the two chief apostles, it had claims upon the obedience and reverence of the whole Christian church such as no other *apostolica sedes* could produce. To the ultimate assertion of these pretensions the long and fierce struggle carried on between the followers of Arius and the supporters of orthodoxy materially contributed. The appeal to the arbitration of Rome, preferred both by Athanasius and by the Arian party, placed JULIUS I. (337–352) in the proud position of the recognized protector of the orthodox faith. In the year 339 Athanasius himself visited the Western capital and resided there for three years. His presence and exhortation confirmed the Roman pontiff still further in his policy; and from this time we perceive the see of Rome assuming, more distinctly than before, the right to define doctrine and the function of maintaining the true standard of faith amid the numerous heresies that were then troubling the whole church. While Constantinople was conspicuous by its attachment to Arianism, Rome appeared as the champion of the orthodox belief. In another direction the Western see would appear to have been also advancing important and exclusive claims. If we accept as genuine the letter of Julius to the Eusebians, written after the acquittal of Athanasius, the pontiff already maintained that, in all proceedings whereby the conduct or orthodoxy of any of the higher ecclesiastical authorities was called in question, the canonical method of procedure required that the Roman see should be consulted before any initiative was taken. In other words, the council which had been convened at Tyre to try Athanasius had usurped the functions which belonged to the pontiff of Rome alone.

During the bishopric of LIBERIUS (352–366) we meet First with the first instance of a schism in the Roman Church, and, in the person of Felix, with the first representative of that maintenance of a rival claim to the see which in later history assumed such importance in connexion with the antipopes. The contested succession of DAMASUS (366–384), although attended by scenes of brutal violence and outrage, affords further illustration of the main question then at issue. Damasus, who had been the personal friend of Liberius, represented the cause of orthodoxy, and his triumph over his rival, Ursinus, was hailed with exultation by the chief contemporary teachers of the church. During his tenure of the see Arianism in the West almost ceased to exist.

At the council of Nicæa (325), one of the canons enacted (the sixth) had already assigned to the three sees, or patriarchates, of Rome, Alexandria, and Antioch, their honorary rank in the order of their enumeration. In the

Rome becomes the centre of orthodoxy.

Creation of the dignity of metropolitan.

Removal of the imperial court to Constantinople.

¹ In the canons of the council of Nicæa (325) the authority of a metropolitan is distinctly recognized, and in those of the council of Antioch (341) it is defined with greater precision.

² The story of the "Donation of Constantine" and the long enumeration of the possessions which he bestowed on the church, preserved in the *Liber Pontificalis*, must be looked upon as accretions of a later period. It is supposed, however, that Constantine built the original Vatican basilica, the church of St Agnes, and the Lateran.

Counter
preten-
sions of
Constan-
tinople.

year 381 the council of Constantinople was convened; it was an assembly in which the Western Church took no share, and its notable third canon was accordingly enacted without opposition. By this it was declared that the bishop of Constantinople, or Nova Roma, was entitled, although the representative of a non-apostolic see, to the next place after Rome, and consequently to precedence of the older and apostolic sees of Alexandria and Antioch. This distinguished position was assigned to him as the supreme ecclesiastical authority in the new centre of political power, and a theory of the basis of ecclesiastical dignity was thus put forward by the church which was in direct conflict with that maintained by Rome.

The De-
cretals.

The pontificate of SIRICIUS (384-398) is chiefly remarkable as that with which commences the series known as the Decretals—a collection of pastoral letters and of replies to questions submitted for their consideration sent by the popes to the churches of the West. These subsequently formed the basis of a vast and elaborate series of forgeries known as the decretals of the pseudo-Isidorus, of which we shall have occasion again to speak; but the genuineness of the letter of Siricius to Himerius, bishop of Tarragona, does not appear to have ever been called in question, and it takes its stand therefore as the earliest existing decretal. In the influence which they exercised upon Western Christianity neither Siricius nor his successor ANASTASIUS I. (398-401) could compare with their illustrious contemporary, Ambrose, bishop of Milan, whom the emperor Theodosius pronounced to be the only true bishop whom he had known. But Ambrose, although acting in perfect independence of the Roman see, always professed to take it as his model in matters of discipline, and by the respect which his example inspired in others for the episcopal office in general he indirectly augmented the conception of the papal prerogatives.

Division
of the
empire.

With the division of the empire in the year 395 the question of the Roman precedence of Constantinople was left for a time in abeyance; but in the West the authority of the bishop of Rome became more and more firmly established. In the following century the general conditions under which he was called upon to act became so materially modified as to constitute a new period in the history of our subject.

Popes of
the 5th
century.

The characters of the men who filled the papal chair during this century, most of them of exemplary life, some of commanding genius, would alone suffice to constitute it a memorable era. "Upon the mind of Innocent I.," says Milman, "seems first distinctly to have dawned the vast conception of Rome's universal ecclesiastical supremacy."

Innocent
I.

INNOCENT I. (402-417) seems indeed to have been the first of the popes who ventured to repudiate those political conceptions which threatened to circumscribe the extending influence of his office. Writing in the year 415 to Alexander, bishop of Antioch, he implies that the church in that city, as an "apostolica sedes," is entitled to rank second only to Rome; "but not," he adds, "so much on account of the grandeur of the city itself as because it is shown to be the first apostolic see" (Mansi, *Concilia*, vol. iii. p. 1055). In the same letter he distinctly repudiates the notion that the church is bound by political divisions; the emperor may create two capitals (*metropoleis*), but it by no means follows that a second metropolitan is to be appointed by the church. In the year 412 he gave practical proof of his determination to assert his own theory of his prerogatives, by appointing the archbishop of Thessalonica his vicar over the extensive province of Illyricum, of which but a small portion lay in the Western empire; and, when the bishops of the province showed themselves less amenable than he had anticipated to his directions in matters of discipline, he insisted with unpre-

cedented explicitness on the jurisdiction of his see as "head of all the churches." Innocent was succeeded by ZOSIMUS (417-418) and BONIFACE (418-422). The former, whose pontificate lasted only twenty-one months, exhibits a noteworthy exception to the traditions of his see, in the disposition he at one time showed to temporize with Pelagianism, and even to set aside in its favour the decrees of his predecessor. The pontificate of Boniface is notable as having been preceded by a contested election which afforded the emperor Honorius an opportunity for the exercise of his intervention, thereby establishing a precedent for imperial interference on like occasions. At the instance of Boniface himself, Honorius enacted an ordinance designed to avert the scandals incident to such contests. By the new provisions, all canvassing for the vacant chair was strictly prohibited; in the event of a disputed election both candidates were to be deemed ineligible; finally, it was essential to any election that the candidate should have been chosen by the unsolicited suffrages of the qualified clergy, and that their choice should have been ratified by the approval of the entire church community. The successor of Boniface was CELESTINUS I. (422-432). The evidence afforded by the events of his pontificate is somewhat conflicting in character. On the one hand, we find the churches of Africa putting forward their latest recorded protest against the Roman pretensions, adducing the sixth canon of the council of Nicæa in support of their protest; on the other hand, the success with which Celestinus intervened in Illyricum, and again in connexion with the sees of Narbonne and Vienne, proves that the papal jurisdiction was being accepted with increasing deference in other parts of the empire. The effect with which his solicited decision was given in the controversy raised by Nestorius, the patriarch of Constantinople, and the synod held under his auspices in Rome (430) for the further consideration of the same question, likewise added to the reputation of his office.

Effects of
barbaric
invasion.

Barbaric invasion, although resulting in the overthrow of many of the institutions of civilization, and in widespread suffering and social deterioration, served but to enhance the influence and importance of the Roman see. The apparent fulfilment of prophecy, pagan as well as Christian, when the city was taken and sacked by Alaric (410), seemed to complete the effacement of the temporal power in Rome. Neither the Western emperors nor the Gothic conquerors held their court in the ancient capital, where the pope was now at once the most important and conspicuous authority. In the African provinces, the demoralization occasioned by the fierce controversies and dissensions concerning Pelagianism and Donatism compelled the Catholic communities to exchange their former attitude of haughty independence for one of suppliant appeal, and to solicit the intervention and counsel which they had before rejected. Such was the aspect of affairs in the West when LEO THE GREAT (440-461)—Leo the pope—succeeded to the primacy. A citizen of Rome by birth, he exemplified in his own character many of the antique Roman virtues—a tenacious adherence to tradition in matters of religious belief, an indomitable resolution in the assertion of the prerogatives of his office, and the austere practice of the recognized duties of social life. This rigid maintenance of orthodoxy had been instilled into him (or at least confirmed) by the exhortations of Augustine, with whom he had become personally acquainted when on a mission to the African province; and before his election to the papal office the celebrated Cassian had conceived so high an opinion of his virtues and abilities as to dedicate to him his treatise on the Incarnation. Regarded, indeed, simply as the able antagonist of the Mani-

chæan and Eutychian heresies, and as the first author of the Collect, Leo would fill no unimportant place in the annals of Latin Christendom; but his influence on church history in other respects is of a far deeper and more potent kind. In none was it followed by more important results than by the success with which he established the theory that all bishops who, in questions of importance, demurred to the decision of their metropolitan should be entitled to appeal to Rome. He obtained the recognition of this principle not only in Illyricum, as his predecessor Innocent had done, but also in Gaul; and the circumstances under which he did so in the latter province constitute the whole proceedings a memorable episode in church history. Celidonius, bishop of Besançon, had been removed from his bishopric by his metropolitan, the eminent Hilary of Arles, and determined to proceed to Rome to appeal against his sentence in person. He was followed thither by Hilary, who courageously protested against any exercise of the pontifical authority which should trench upon his own as metropolitan, and for which, in the present instance, it seems to be generally admitted that the canons of the church down to the time of Dionysius Exiguus (fl. 525) afforded no sanction.¹ Leo, however, not only annulled the sentence of deprivation, but condemned Hilary's entire conduct. The latter could only remonstrate in terms of energetic but ineffectual protest, and then took his departure from the city to die soon after at Arles. His name, along with that of Irenæus, stands at the head of that long succession of able churchmen who, sometimes in conjunction with the temporal power and sometimes independently of it, have gained for the Gallican Church a character for systematic opposition to the encroachments of the Roman see which (if we except the Church of Utrecht) is unique among the communities of Western Catholicism. In a circular letter to the churches of Gaul, Leo subsequently passed a formal and deliberate censure upon Hilary's conduct; and this measure was followed up by an imperial edict, in which, again, we have a remarkable illustration of that compact between the state and the church which assumed such importance at a later period. In this decree of Valentinian III. (445) the primacy of Rome is placed upon a triple basis—the merits of St Peter, the majesty of the city of Rome, and the authority of a council (*sacree synodi auctoritas*). To which of the councils reference is intended is by no means clear; but all bishops are required by this imperial edict to present themselves when summoned at the tribunal of the Roman pontiff (*Novellæ*, ed. Hänel, pp. 172–5). As, prior to this time, the emperors themselves had always claimed, though they had not invariably exercised, the right of representing a supreme court of appeal, this transfer of such a prerogative to Rome may fairly be regarded as marking the commencement of a new era in the conception of the papal office.

Rome constituted a court of appeal.

Influence of Arianism.

The chief obstacle to the recognition of the supremacy of the Roman pontiff was now to be found in the revival of Arianism, which, professed alike by the Goth and the Vandal, represented the dominant faith in the chief cities of northern Italy, as well as in Africa, Spain, and southern Gaul. But the rivalry thus generated only increased the disposition of the Catholic party to exalt the prerogatives of their head, and the attitude of Rome towards other churches continued to be more and more one of unquestionable superiority. In the year 483 Pope FELIX II. (or III.) ventured upon an unprecedented measure in citing Acacius, the patriarch of Constantinople, to Rome, to answer certain allegations preferred against him by John,

patriarch of Alexandria, whom he designates as “*frater et coepiscopus noster*” (Thiel, *Epistolæ*, p. 239). On Acacius refusing to recognize the legality of the letter of citation, he was excommunicated by Felix. The successor of Felix, GELASIUS I. (492–496), refused to notify, as was customary, his election to the patriarch of Constantinople, and by his refusal implicitly put forward a fresh assumption, viz., that communion with Rome implied subjection to Rome. Throughout the pontificate of Gelasius the primacy of the Roman see was the burden of his numerous letters to other churches, and he appears also to have been the first of the pontiffs to enunciate the view that the authority which he represented was not controllable by the canons of synods, whether past or present. In Italy these assumptions were unhesitatingly accepted. The Palmar Synod, as it was termed, convened in Rome during the pontificate of SYMMACHUS (498–514) formally disavowed its own right to sit in judgment on his administrative acts. Ennodius, bishop of Pavia (*circa* 510), declared that the Roman pontiff was to be judged by God alone, and was not amenable to any earthly potentate or tribunal. It is thus evident that the doctrine of papal infallibility, though not yet formulated, was already virtually recognized.

During the Gothic rule in Italy (493–553), its representatives manifested the utmost tolerance in relation to religious questions, and showed little disposition to impose any restraints on the policy of the popes, although each monarch, by virtue of his title of “king of the Romans,” claimed the right to veto any election to the papal chair. In the year 483, when Odoacer sent his first lieutenant, Basilius, from Ravenna to Rome, the latter was invested with the titles “*eminentissimus*” and “*sublimis*.” The pope accordingly appeared as politically the subject of his Arian overlord. The advantage thus gained by the temporal power appears to have been the result of its intervention, which SIMPLICIUS (468–483) had himself solicited, in the elections to the papal office, and one of the principal acts of the Palmar Synod (above referred to) was to repudiate the chief measures of Basilius, which had been especially directed against the abuses that prevailed on such occasions, and more particularly against bribery by alienation of the church lands. The assertion of this authority on the part of the civil power was declared by the synod to be irregular and uncanonical, and was accordingly set aside as not binding on the church. The fierce contests and shameless bribery which now accompanied almost every election were felt, however, to be so grave a scandal that the synod itself deemed it expedient to adopt the ordinance issued by Basilius, and to issue it as one of its own enactments. In order more effectually to guard against such abuses, BONIFACE II., in the year 530, obtained from a synod specially convened for the purpose the power of appointing his own successor, and nominated one Vigilius—the same who ten years later actually succeeded to the office. But a second synod, having decided that such a concession was contrary to the traditions of episcopal succession, annulled the grant, and Boniface himself committed the former decree to the flames. At his death, however, the recurrence of the old abuses in a yet more flagrant form induced the senate to obtain from the court of Ravenna a measure of reform of a more comprehensive character, and designed to check, not only the simoniacal practices within the church itself, but also the extortion of the court officials.

In the year 526 Dionysius Exiguus, a monk in Rome, undertook the labour of preparing a new collection of the canons of the councils, and, finding his production favourably received, proceeded also to compile a like collection of the papal letters or decretals, from the earliest extant

¹ That is, unless we admit the genuineness of the canons of the council of Sardica (343), which probably few who have studied the evidence will be prepared to do.

The Gothic monarchs.

Dionysius Exiguus.

down to those of Anastasius II. in his own day. The letters of the popes were thus placed on a level with the rescripts of the emperors, and in conjunction with the canons formed the basis of the canon law, which afterwards assumed such importance in connexion with the history of the church. The negative value of the collection formed by Dionysius may be said, however, almost to equal that of its actual contents; for, from the simple fact that it does not contain those yet earlier decretals subsequently put forth by the pseudo-Isidorus, it affords the most convincing disproof of their genuineness.

Results
of sub-
jection
to the
Greek
emperors.

The substitution of the rule of the Greek emperors for that of the Gothic monarchs was inimical in almost every respect to the independence and reputation of the pope-dom. For a short interval before Justinian landed in Italy, AGAPETUS (535-536), appearing as the emissary of Theodotus to the Eastern court, assumed a bearing which inspired the emperor himself with respect, and his influence was sufficiently potent to procure the deposition of one patriarch of the Eastern capital and to decide the election of another. But, after Belisarius entered Rome and the city had been reduced to subjection, the pontiff was seen to be the mere vassal of the emperor, and not only of the emperor but of the courtesan on the imperial throne. The deposition of SILVERIUS (536-540), and his mysterious fate at Pandataria, together with the elevation of VIGILIUS (540-555), the nominee of the abandoned Theodora and her pliant slave, completed the degradation of the Roman see. Each successive pope was now little more than a puppet which moved at the pleasure of the Eastern court; and the *apocrisarius* or deputy whom he maintained at that court was generally (as in the case of Pelagius I., Gregory I., Sabinian, Boniface III., Martin) his own successor—an honour purchased, it can hardly be doubted, by systematic compliance with the imperial wishes. In the career and fate of Vigilius the papal office was dishonoured as it had never been before, at once by the signal unworthiness of its bearer and by the indignities heaped upon him by the savage malice of his foes. So sinister, indeed, had become the relations between the Roman bishop and the Eastern court that PELAGIUS I. (555-560) is said to have besought Narses to send him to prison rather than to Constantinople.

Invasion
of the
Lom-
bards.

In the year 568 the Lombards invaded Italy. Like the Goths they become converts to Arianism; but they were also far less civilized, and looked with little respect on Roman institutions and Roman habits of thought, while their arrogance, faithlessness, and cruelty gained for them the special detestation of the Roman see. Their conquests did not extend over all Italy. Ravenna and the Pentapolis, Venice, Rome and its duchy (as the surrounding district was then termed), Naples, Calabria, and Sicily remained subject to the empire. In the peninsula the pope was, after the exarch of Ravenna, the most powerful potentate, and the presence of a common foe caused the relations between himself and the empire to assume a more amicable character. The emperor, indeed, continued to control the elections and to enforce the payment of tribute for the territory protected by the imperial arms; but, on the other hand, the pontiff exercised a definite authority within the Roman duchy and claimed to have a voice in the appointment of the civil officers who administered the local government. From the time of Constantine the Great the church had possessed the right of acquiring landed property by bequests from individuals, and the Roman see had thus become greatly enriched. Some of its possessions lay far beyond the confines of Italy. It was one of the last acts of Celestine I. to address to the emperor Theodosius II. an appeal for the imperial protection of certain estates in Asia, which

a lady named Proba had bequeathed to the Roman see for the maintenance of "the clergy, the poor, and certain monasteries" (Coustant, ed. Schoenemann, p. 879). "Ever since the restriction of the Western empire," says Mr Bryce, "had emancipated the ecclesiastical potentate from secular control, the first and most abiding object of his schemes and prayers had been the acquisition of territorial wealth in the neighbourhood of his capital. He had indeed a sort of justification, for Rome, a city with neither trade nor industry, was crowded with poor, for whom it devolved on the bishop to provide." The motives for acquiring such wealth did not, accordingly, cease to actuate the pontiff, even when the paralysing influences of the imperial despotism were again very sensibly felt; but the territory thus gained, known as the "patrimonium Petri," must not be supposed to have involved that claim to temporal sovereignty put forth at a later period. Originally bestowed mainly for the relief of the sick and destitute, the patrimonial revenues came, in course of time, to be applied to the maintenance of the pope himself and the clergy of his diocese, and to the erection and repair of churches. They were strictly inalienable; and the pontiff himself was regarded simply as the steward, for the time being, of the estate.

Under GREGORY I. (590-604), commonly known as Gregory the Great, this territorial wealth became largely augmented; and, although, amid the universal demoralization and widespread misery of his age, he professed to discern the unmistakable signs of the approaching end of the world, the efficient administration of the estates of the church was an object of his unceasing solicitude. Of noble descent, great wealth, and considerable learning, he possessed also a capacity for administration not inferior to that of his predecessor Leo, and his best energies were devoted to the interests of his diocese and the alleviation of the want and misery of which it was the constant scene. His *Letters*, which constitute a remarkable picture both of the man and his age, and attest the minute and unwearied care which he bestowed on everything relating to the affairs of his see, appear to have been taken as the model for the *Liber Diurnus*, or journal of the Roman curia, which was commenced in the following century. In other respects his genius for administration, his good sense and tact, are equally conspicuous. Through his influence with Theodelinda, the wife of Agilulf, the Lombard monarch, he not only succeeded in averting another siege of Rome, but he also managed to bring about the establishment of amicable relations between the Lombards and the Roman population. With the Byzantine court he did his best to maintain a friendly intercourse, although in his zeal on behalf of monasticism he withdrew his *apocrisarius* from Constantinople, when the emperor Maurice forbade his soldiers to assume the monastic life. It is perhaps the greatest blot on Gregory's memory that, when the emperor and his family were cruelly murdered by Phocas, who seized upon the imperial dignity, Gregory was not above congratulating the usurper on the circumstances of his accession, an act of adulation but insufficiently extenuated by his panegyrists, as taking its rise in feelings of genuine, though mistaken, religious enthusiasm. His efforts on behalf of primary education, which have caused him to take rank in the Roman calendar as the patron saint of school festivals, are deserving of high praise; but, on the other hand, his illiberal condemnation of the pagan literature (in striking contrast to the Benedictine traditions of a later time) diminishes not a little our impression of his real greatness. He stands, however, among the foremost of the popes, and the impress of his character and teaching must be held to have permanently modified the views and policy of the Roman curia.

The successors of Gregory.

The personal qualities and virtues of Gregory are thrown into stronger relief by the comparative insignificance of his successors in the 7th century, whose tenure of office was, for the most part, singularly brief and inglorious. His immediate successor was SABINIANUS (604–606), who after a few months' tenure of office, and an interval of a whole year which remains entirely unaccounted for, was succeeded by Boniface III. (607). Boniface was the last *apocrisiarius* who had represented Gregory at the imperial court, and he appears to have been successful in completely winning the favour of Phocas, who at his suggestion passed a decree declaring "the Apostolic Church of Rome" to be "the head of all the churches." He did this, says Paulus Diaconus, "because the church of Constantinople had styled itself the first of all the churches."¹ In this manner the imperial veto was distinctly pronounced on the claim of the Byzantine Church to be regarded as of universal authority—a claim which it now became the policy of the Church of Rome to assert on her own behalf on every possible occasion. The new and intimate relations which Gregory and his emissaries had created between the church and the great Teutonic races especially favoured these assumptions. Frankland and England alike were brought within the range of influences of incalculable after importance, the development of which in the 7th and 8th centuries may fairly be looked upon as constituting a distinct era in the history of the popedom. In Rome itself, on the other hand, the interest of the drama becomes perceptibly lessened. In the long and rapid succession of the pontiffs, most of them pliant Greeks or Syrians, the nominees of the exarch of Ravenna, and intent on winning the favour of both the emperor and his representative, scarcely one appears as actuated by more than the traditional views of his office and its functions. One of them, who ventured to thwart the imperial purpose, paid dearly for his conscientiousness. The Byzantine capital, at this period, was distracted by the interminable controversies carried on between the Monothelites and their opponents. The emperor, the half-insane Constans, arrogated to himself the function of mediating between the contending parties, and sought to wring from MARTIN I. (649–653) an authoritative assent to a compromise of doctrine which, to that pontiff, appeared to involve the sacrifice of orthodoxy. The latter convened a council at the Lateran and formally condemned the proposed solution. He was soon after induced to repair to Constantinople, and, having there been arraigned on a false charge of fomenting political intrigue, was deprived of his see and, although in advanced years and feeble health, banished to a gloomy prison on the Euxine, where he soon after died.

Advances made by the papacy in the West.

But, while thus menaced and dishonoured in Italy, the papal power was making important advances in the west. In England the resistance offered by the representatives of the British Church was soon overcome, and from the time of the council of Whitby (664) the teachings and traditions of Gregory, as enforced by Augustine, Theodorus, Wilfrid, and others, found ready acceptance. The humanizing influences which these representatives of the Roman culture diffused around them exercised a potent spell over the minds and wills of the English population. Monasteries were founded; cathedrals rose, each with its school of instruction for the young, and its charity for the needy; and a spirit of filial though far from slavish devotion to Rome was everywhere created.

Relations to Frankland. In Frankland, however, the Merovingian kings and the populations of Neustria and Austrasia exhibited a

different spirit, and the civil power showed no disposition to welcome foreign interference even in connexion with ecclesiastical institutions. It is observed by Guizot that from the death of Gregory the Great to the time of Gregory II. (604–715) not a single document exists which can be cited as proof of intercommunication between the rulers of Frankland and the papacy. The series of events which led to such different relations, enabling the Roman pontiff eventually to shake off both his fear of the Lombard and his long dependence on the Byzantine emperor, forms one of the most interesting passages in European history.

In the year 715 the long succession of pliant Greeks and Syrians in the papal chair was broken by the election of a man of Roman birth and endowed with much of the strength of purpose that belonged to the ancient Roman. In GREGORY II. (715–731) men recognized no unworthy successor of his great namesake, and by Gibbon he is regarded as the true "founder of the papal monarchy." In no respect were his care and religious sentiments more conspicuously manifested than in connexion with the evangelization of distant lands, and it was under his auspices that the celebrated Winfrid or Boniface first commenced his famous missionary work in Frankland. His rapid success in the work of converting the still heathen populations is a familiar story. From GREGORY III. (731–741) Boniface received the appointment of papal legate; he took the oath of perpetual fidelity to the supreme pontiff, and wherever he went he preached the duty of a like submission. He enforced the theory of the Catholic unity and of the obligation of the whole body of the clergy to render implicit obedience to the representative of that unity,—the successor of St Peter, the spiritual superior of all earthly tribunals.

While bonds of union were thus being created in the West, theological differences were exercising a very different though not less important influence in the East. It was in the year 731 that Gregory III., the last of the pontiffs who received the confirmation of his privileges from Constantinople, issued a sentence of excommunication against the Iconoclasts. It was the papal rejoinder to the decree of Leo the Isaurian, passed in the preceding year, commanding that all images in the churches of the empire should be forthwith removed. Although he was a Syrian by birth, orthodoxy was dearer to Gregory than political allegiance, and the sequel justified his policy. The emperor, indeed, retaliated by what could not but be deemed a disastrous blow. All the dioceses within the empire where the Roman pontiff had hitherto claimed obedience—Calabria, Sicily, and Illyricum—were forthwith absolved from their ecclesiastical allegiance, and the revenues from their rich "patrimones," which had before flowed into the papal treasury, were confiscated. But the tie which had hitherto bound the popedom to the empire was thus effectually broken.

Under these circumstances a compact with the Lombards, who had by this time become converts from Arianism to the Catholic faith, would have seemed the obvious policy on the part of Rome, had not the political aims of the former stood in the way. The Lombard coveted the possession of the capital, and this design, the cherished design of centuries, marked him out as perforce the foe of the popedom. In his extremity, therefore, the Roman pontiff turned to the Frank, untainted by the heresy of Arianism, and already, as the result of the teaching of Boniface, disposed to assent to any claims of the papacy which did not involve the diminution of his own prerogatives or the restoration of alienated revenues. In the year 752 Pepin le Bref assumed the dignity and title of "king of the Franks." He did so, the annalists are unanimous in assuring us, with the consent and sanction

¹ *De Gestis Longobard.*, bk. iv., c. 36; this remarkable passage is reproduced by Bede, *De Temporum Ratione*, Migne, *Patrol.*, xc. 565; and also by Anastasius, *De Vitis Rom. Pont.*, in life of Boniface III., Migne, *Patrol.*, cxxviii. 671.

of Pope Zacharias, and he was anointed and crowned by Boniface—a momentous precedent in relation to European history. In the following year, during the pontificate of STEPHEN III. (752–757) Aistulf, the king of the Lombards, invaded the duchy of Rome with the avowed purpose of adding the capital itself to his dominions. He seized Ravenna and the exarchate; and Stephen, finding remonstrance and entreaty alike unavailing, fled for protection to the Frankish territory and was received by King Pepin with every mark of sympathy and profound respect. Within a short time after, Pepin invaded the Lombard domain and wrested from its monarch an extensive territory embracing Ravenna and the Pentapolis; and at a council held at Quiercy, in the same year (754), he handed over this territory to Stephen, “to be held and enjoyed by the pontiffs of the apostolic see for ever.” Such appears to be the real origin of that “donatio,” or gift of territory (referred back, by the invention of after times, to the age of Constantine the Great), which constituted the pope a temporal ruler over what were subsequently known as the “States of the Church.” The munificence of Pepin was rivalled by that of his son. In the year 774, on the occasion of the visit of Charles (known as the Great) to Rome, the donation of his father was made the ground for soliciting and obtaining a yet larger grant, comprising much of the territory already bestowed, but extending to at least double the area stipulated for in the earlier donation.

State of the papal claims at the close of the 8th century. It will thus be seen that, towards the close of the 8th century, the germs of the chief papal claims were already in existence, and only needed for their full development those favouring conditions which, with the lapse of time, were certain to occur, and for which, from its peculiar character as an institution, the popedom itself was so well able to watch and wait. Already the pontiff claimed the dispensing power, *i.e.*, the right to dispense with the observance of the existing canonical law under conditions determinable at his pleasure. Already he claimed the right to confer privileges—a power subsequently wielded with enormous effect in enabling monastic and episcopal foundations to urge their encroachments on the rights and jurisdiction of the secular power. He assumed again, in Western Christendom at least, the rights of an universal metropolitan—demanding that in all elections to bishoprics his sanction should be deemed essential; and the arrival of the *pallium* from Rome was already awaited with anxiety by all newly-elected metropolitans. By the encouragement which was systematically given to appeal to Rome, what had before been the exception became the practice, and that “extraordinary” authority, as it was termed, which had been introduced, in the first instance, only under the pretext of providing a fixed court of appeal in cases of dispute which threatened otherwise to prove incapable of adjustment, developed into an immediate and ordinary jurisdiction—into an authority, that is to say, which in all questions of graver import set aside that of the bishop, and even that of the metropolitan, and made reference to Rome the rule rather than the exception. In theory, although the claim was admitted neither by the rulers of Frankland nor by those of England, the Roman pontiff already claimed also to present to all benefices. Although he had not, as yet, assumed the distinctive insignia of his office—the triple crown and the upright pastoral staff surmounted by the cross—he more and more discouraged the application of the name of “papa” (pope) to any but himself. The title of “universal bishop,” which both Pelagius II. and Gregory the Great had disclaimed, seemed his by right after the decree of Phocas, and with the lapse of two centuries from that time was assumed by no other rival. The titles of “apostolicus,”

“claviger” (the bearer of the keys), and “servus servorum Dei” were claimed in like manner as exclusively his. One temporal potentate had already received his crown as a grant from the pontifical chair; the occupant of that chair was already himself a temporal sovereign.

That the mediæval conception of the papal office was one of gradual and slow development appears accordingly to be beyond all reasonable doubt, and this feature belongs in common to the whole hierarchical system. We find, for example, that the conception of the episcopal order and its functions grew with the increasing power and wealth of the church. In like manner if we compare the theory of the equality of bishops one with another, enunciated by Cyprian, with the prerogatives of a metropolitan, as laid down at the council of Antioch (341), and subsequently further magnified, we are conscious of the introduction of what is tantamount to a new theory. And, finally, we become aware of yet another hierarchical order, as we see rising up the patriarchates of Rome, Alexandria, Antioch, Jerusalem, and Constantinople, each invested by the church with an assigned order of precedence. Something, however, was yet wanting which should crown the gradations thus successively created, and complete the analogy to the Roman political organizations—the institution of the monarchical dignity. It was for this supreme honour that Rome and Constantinople contended, at a time when, from various causes and circumstances, the other patriarchates had sunk into an inferiority too marked to admit of rivalry. In this contest the patriarch of Constantinople rested his claim on what may be termed the traditional political foundation—the honour due to the patriarch of the chief seat of empire; this plea, although already sanctioned by the church, was met on the part of Rome by a counter appeal to the supreme reverence due to what was not merely an “apostolica sedes,” but a see founded by two apostles, of whom one was the chief of the apostolic order. In this remarkable abandonment of the ancient plea for pre-eminence and the limitation of the argument to that derivable from the claim to be an apostolic see, much of the difficulty and obscurity that belong to the earlier history of the papacy had probably its origin. And it seems but too probable that the endeavour to disguise this change, and to represent the claims advanced by Innocent I., by Leo I., by Gregory the Great, and by Hadrian II., as *already virtually asserted and admitted in the 4th century and in yet earlier times*, has given rise to endless wrestlings of isolated passages in writers of good authority, to deliberate falsification of genuine documents, and to what are allowed on all hands to be direct and palpable forgeries. Another feature, which has been made subservient to no small amount of misrepresentation, must not be overlooked. From their earliest appearance, the distinctive claims advanced by the Roman see can only be regarded as a series of encroachments on that original conception of the episcopal office maintained by Cyprian. And so long as the other patriarchates—Alexandria, Antioch, and Jerusalem—maintained their ground, these encroachments wore a comparatively inoffensive guise, being little more than the assertion of the rights of a patriarch or supreme metropolitan within the Roman diocese. But, in addition to and distinct from the patriarchal supremacy, there was the theory of the primacy of the bishop of Rome over all the bishops, patriarchs, and metropolitans—at first little more than an honorary distinction and carrying with it no definite authority or jurisdiction. When the patriarchates of Alexandria, Antioch, and Jerusalem could no longer appear as rivals and Rome was confronted by Constantinople alone, this theory was brought much more prominently forward; while at the same time, in order

the better to enforce the papal claims, a confusion was designedly and skilfully introduced of the honorary primacy derived from St Peter with the actual rights of the head of the Roman diocese. The precedents afforded by the former were adduced in support of the universal jurisdiction claimed by the latter, and in an ignorant and uncritical age were with little difficulty represented as affording sufficient warrant for a large proportion of the claims asserted in the 9th century. It is by the light which we derive from these considerations that we are enabled to discern what appears to be the only theory which offers a solution of the tradition respecting St Peter and his successors that is in harmony with the historical evidence. When we consider that in the course of the 5th century papal Rome, partly from the ambition of her pontiffs, partly from the concurring influence of external circumstances, had acquired a position of authority in relation to Christendom at large which afforded the prospect of yet more complete and general pre-eminence, and that towards the assertion of such pre-eminence her claim to rank as the greatest and most honoured of the "apostolicæ sedes" seemed to offer effective aid, the appearance of legends and spurious documents tending to support such a claim can excite no surprise in the minds of those familiar with the literature of the period. As in the 2d century the attempt to reconcile two earlier and corrupt traditions respecting St Peter's presence and work in Rome gave rise to the tradition of his five-and-twenty years' episcopate, so, we can understand, it was probably sought to substitute for the simple tradition preserved in "Hegesippus" and Irenæus, with respect to St Peter's successors, official records (purporting to supply details such as no other church had preserved, and such as it is in the highest degree improbable that the church at Rome should have succeeded in preserving) of an early episcopal succession; while the discrepancies of the different lists that profess to record this succession admit, again, of an adequate if not a satisfactory explanation, if we regard them as, for the most part, independent and purely conjectural efforts to invest the earlier episcopal office with an historical importance to which in the first two centuries it certainly had not attained.

While the Western primate was thus growing in dignity, wealth, and influence, those ecclesiastical potentates who had once claimed an equal or coordinate rank, with the sole exception of the patriarch of Constantinople, altogether ceased to exist. The Saracén conquests in Syria and Egypt had involved the loss of Jerusalem to Christendom (637), and this had been speedily followed by the extinction of the churches of Antioch and Jerusalem. The patriarch of Constantinople represented, accordingly, the only spiritual power which could compare with that of Rome; but, while he continued to be the submissive vassal of the Byzantine court, that court was compelled to see the once no less submissive pontiff of Rome changed into a successful invader of its Italian possessions and into a determined repudiator of its articles of faith. In the year 800 Charles the Great received at the hands of Leo III., in Rome, the imperial crown, and the titles of "emperor" and "Augustus." The authority by virtue of which Leo assumed the right to confer such dignities was probably by no means quite clear even to those who were witnesses of the imposing ceremony. It may perhaps be best described as derived partly from his sacerdotal function, as displayed in the consecrating rites, and partly from the fact that he also acted as the representative of the people in their capacity of electors. To the Byzantine emperor, the whole ceremony and the titles conferred seemed a direct menace to his own prerogative, and completed the estrangement between the West and the East.

From that time down to the 15th century Greek institutions and Greek culture were the special objects of dislike and distrust to the papacy. The use of the Greek language had already been discontinued in the records of the Roman Church; and the study of its literature was now systematically discouraged. The assumption by Charles of the imperial dignity and the consequent rise of the "Holy Roman Empire" were events on the importance of which it is unnecessary here to dwell. By the theory thus established, a temporal supremacy or "condominium" was created corresponding to the spiritual supremacy of the popedom, and the Roman emperor claimed from all other rulers in Christendom an allegiance corresponding to that which the Roman pontiff claimed from all other ecclesiastical potentates. The imperial authority and papal authority were thus complementary the one to the other. The emperor claimed to confirm the papal elections; the pope claimed to confer the imperial crown upon the emperor. But the precise adjustment of these respective claims, and the further assumptions which they suggested or favoured, according as the empire or the papacy proved for the time the stronger, gave rise to a series of memorable struggles which sometimes assume proportions that constitute them the pivot on which contemporary history throughout Europe may be said to revolve. The compact originally made between the empire and the popedom, however plausible in theory, was indeed attended with no little danger to both. At one time it appeared probable that the state would overwhelm the ecclesiastical organization and convert it into a machine for political purposes; at another time it seemed no less likely that the latter would subjugate the former and reduce all Western Christendom to a vast spiritual tyranny. During the three centuries that followed upon the creation of the Holy Roman Empire—from the year 800, that is to say, down to the Concordat of Worms (1122)—it was chiefly the former contingency that seemed the more probable. During the pontificate of NICHOLAS I. (858–867), however, the papacy again made a perceptible advance. I. Nicholas intervened with signal effect in the disputed succession to the Eastern patriarchate, and asserted more distinctly than it had ever been asserted before the theory of the Roman supremacy. He dared, also, to forbid the divorce of Lothair (the powerful monarch of the vast territory which stretched from the German Ocean to the Mediterranean) from his wife Theutberga, thereby establishing an important precedent for papal interference in questions of private morality. And, finally, in his arduous struggle with Hincmar, metropolitan of Rheims, he gained an important victory over the powerful prelates on the Rhine in the question of appeal. It must, however, be admitted that this last advantage was gained only by the use of forged documents—the pseudo-Isidorian decretals, which seem to have first seen the light about the year 850; it was pretended that they had been compiled by Isidore of Seville, an eminent writer and ecclesiastic of the 7th century, and had been brought from Spain to Mainz by Riculphus, the archbishop of that city. This collection embodied a complete series of letters purporting to have been written by the popes of Rome from the time of Clemens Romanus down to that with which the collection by Dionysius Exiguus commences, thus filling up the entire blank, and affording among other data ample precedent for appeals to Rome of the kind against which Hincmar had protested. When some doubt was raised as to the genuineness of the collection, Nicholas did not scruple to assure Hincmar that the originals had been lying from time immemorial in the Roman archives. Among many other fundamental positions laid down in these decretals was one to the effect that no council of the

The false
decretals.

church had canonical validity unless it had been summoned with the sanction of the holy see. The assertion of this theory rendered it necessary considerably to extend the practice of appointing papal legates (*legati a latere*), who now became the ordinary channels of communication between Rome and the Western churches, and through whom all affairs of importance were transacted. The legate convened the provincial councils and presided over them, taking precedence even of the metropolitan. Such encroachments enable us at once to understand how it was that Henry I. of England deemed it necessary to demand from Paschal II. a promise that no legate should be sent into the kingdom until the royal assent had been previously obtained. From the pontificate of Nicholas we date a notable diminution in the power of the metropolitans.

The false decretals have been described as the source to which we may trace that great revolution in the relations of church and state which now gradually supervened. The pontificate of HADRIAN II. (867-872) is especially notable for the application which he sought to make of some of the principles which they laid down. When Lothair, king of Lotharingia, died without heirs, Hadrian claimed the right to bestow the crown on the emperor Louis. Christian Europe, however, was not as yet prepared to accept this bold extension of the papal prerogatives. The kingdom was seized by Charles the Bald, and Hadrian was reminded in a manifesto drawn up by the bishops of Germany that he could not at once be "universal pope and universal king." But the weakness of Charles's claim was undeniable, and we accordingly find him, five years later, consenting to receive the imperial crown at the hands of JOHN VIII. (872-882), not as his heritage but as a gift from the pope. During the dark and stormy period that intervened between the death of Charles the Bald and the coronation of Otto the Great at Rome (962), the Carolingian empire broke up, and the results that followed were disastrous both for the popedom and the empire. The Saracens occupied southern Italy, and menaced on more than one occasion the capital itself; the Normans poured in successive waves over Frankland; the ravages of the Magyars were yet wider spread and not less terrible. Alike in the civil and the ecclesiastical world the elements of strife and insubordination were let loose; and, while the feudal lords defied the authority of their king, and the power of the French monarch sank to the lowest ebb, the bishops in like manner forsook their allegiance to the Roman pontiff. The archbishops of Ravenna and Milan appeared indeed as his rivals, and the political influence which they commanded more than equalled his: the 10th century has been designated "the noon-day of episcopal independence."

The history of the curia at this period is marked by the deepest moral degradation and the most revolting scenes. The papal jurisdiction was limited almost entirely to the capital itself, and even the succession of the pontiffs themselves is with difficulty to be traced. The office, indeed, was sometimes disposed of by the influence of immoral women. The pontificate of STEPHEN VI. (or VII., 896-897) is remembered only for the inhuman manner in which he treated the lifeless corpse of his predecessor Formosus; that of SERGIUS III. (904-911) for the virtual reign of Theodora and her daughter, the two most notorious courtezans of the age; STEPHEN IX. (939-942) was disfigured for life by the brutal treatment which he received at the hands of the Roman mob.

In the dismembered empire, the kingdom of Germany first exhibited signs of returning order and cohesion; and at the solicitation of Pope JOHN XII. (955-963) King Otto led an army into Italy, rescued the land from its cruel oppressor, Berengar, the feudal lord of the realm, and was anointed emperor at Rome. John, however, who

was one of the worst of the pontiffs, ill repaid the service rendered to the see; and, foreseeing that the restoration of justice and law was likely to prove fatal to his own misrule, he proceeded to plot the emperor's overthrow. He was summoned to appear before a council presided over by the latter, to meet the accusations brought against him, and, having failed to appear, was formally deposed. On the same occasion the imperial right to confirm the election to the papal office (which had been for some time in abeyance) was formally restored. Of the pontiffs whose names stand in the subsequent succession two were antipopes, BENEDICT V. (964) and BONIFACE VII. (984-985), set up by the party in rebellion against the imperial power.

With the restoration of law and order the ancient regard for the popedom regained its hold on the minds of men. Under the guidance of the celebrated Gerbert, the youthful enthusiasm of Otto III. aimed at making Rome once more the centre of political dominion and the seat of the imperial power. Hugh Capet, too, professed himself the "defender of the church." A strong sense began also to find expression of the infamy attaching to the associations of the curia. At the first of the two councils convened at Rheims in 991 it was formally demanded, by what decree it was that "numberless priests of God, famed alike for learning and virtue, were subjected to the rule of monsters of iniquity wanting in all culture, whether sacred or profane." The French monarchs were glad, however, to purchase the support of the papacy to aid them in their struggle with the rebellious chieftains by whom the very existence of their authority was menaced, and, until the action of the papal legates again roused the spirit of national resistance, the Capetian dynasty was loyal to the Roman see. That it was so was in no small measure due to the virtues and abilities of GREGORY V. (996-999), the kinsman of Otto III., a young man of considerable attainments, austere morality, and great energy of purpose, who succeeded to the papal chair at the age of twenty-four. He was succeeded by Gerbert, Pope SILVESTER II. (999-1003), from whom Otto III. derived, as already stated, his ideas of Italian and papal regeneration. But in Germany neither the nobility nor the episcopal order could contemplate with equanimity the projects of either pontiff or emperor, and Otto's schemes were met with a stubborn and paralysing resistance. Then the feudal princes of the Roman states rose in insurrection; and the ardent young reformer was taken off—it was believed, by poison—at the age of two and twenty, to be followed in the next year by his faithful preceptor on the pontifical throne.

With the disappearance of these two eminent men the popedom relapsed into its former degradation. The feudal nobility—that very "refuse" which, to use the expression of a contemporary writer, it had been Otto's mission "to sweep from the capital"—regained their ascendancy, and the popes became as completely the instruments of their will as they had once been of that of the Eastern emperor. A leading faction among this nobility was that of the counts of Tusculum, and for nearly half a century the popedom was a mere apanage in their family. As if to mark their contempt for the office, they carried the election of Theophylact, the son of Count Alberic, a lad scarcely twelve years of age, to the office. BENEDICT IX. (1033-1045), such was the title given him, soon threw off even the external decencies of his office, and his pontificate was disgraced by every conceivable excess. As he grew to manhood his rule, in conjunction with that of his brother, who was appointed the patrician or prefect of the city, resembled that of two captains of banditti. The scandal attaching to his administration culminated when it was known that, in order to win the hand of a lady for whom he had conceived a passion, he had sold the pontifical office

itself to another member of the Tusculan house, John, the arch-priest, who took the name of GREGORY VI. (1045-46). His brief pontificate was chiefly occupied with endeavours to protect the pilgrims to Rome on their way to the capital from the lawless freebooters (who plundered them of their costly votive offerings as well as of their personal property), and with attempts to recover by main force the alienated possessions of the Roman Church. Prior, however, to his purchase of the pontifical office, the citizens of Rome, weary of the tyranny and extortions of Benedict, had assembled of their own accord and elected another pope, John, bishop of Sabina, who took the name of SILVESTER III. (rival pope, 1044-46). In the meantime Benedict had been brought back to Rome by his powerful kinsmen, and now reclaimed the sacred office. For a brief period, therefore, there were to be seen three rival popes, each denouncing the others' pretensions and combating them by armed force. But even in Rome the sense of decency and shame had not become altogether extinguished; and at length a party in the Roman Church deputed Peter, their archdeacon, to carry a petition to the emperor, Henry III., soliciting his intervention. The emperor, a man of deep religious feeling and lofty character, responded to the appeal. He had long noted, in common with other thoughtful observers, the widespread degeneracy which, taking example by the curia, was spreading throughout the church at large, and especially visible in concubinage and simony,—alike regarded as mortal sins in the clergy. He forthwith crossed the Alps and assembled a council at Sutri. The claims of the three rival popes were each in turn examined and pronounced invalid, and a German, Suidger (or Suger), bishop of Bamberg, was elected to the office as CLEMENT II. (1046-47).

The German popes.

Leo IX.

The degeneracy of the church at this period would seem to have been in some degree compensated by the reform of the monasteries, and from the great abbey of Cluny in Burgundy there now proceeded a line of German popes, who in a great measure restored the dignity and reputation of their office. But, whether from the climate, always ill-adapted to the German constitution, or from poison, as the contemporary chronicles not unfrequently suggest, it is certain that their tenure of office was singularly brief. Clement II. died before the close of the year of his election. DAMASUS II., his successor, held the office only twenty-three days. LEO IX., who succeeded, held it for the exceptionally lengthened period of more than five years (1049-54). This pontiff, although a kinsman and nominee of the emperor, refused to ascend the throne until his election had been ratified by the voice of the clergy and the people, and his administration of the office presented the greatest possible contrast to that of a Benedict IX. or a Sergius III. In more than one respect it constitutes a crisis in the history of the popedom. In conjunction with his faithful friend and adviser, the great Hildebrand, he projected schemes of fundamental church reform, in which the suppression of simony and of married life (or concubinage, as it was styled by its denouncers) on the part of the clergy formed the leading features. In the year 1049, at three great synods successively convened at Rome, Rheims, and Mainz, new canons condemnatory of the prevailing abuses were enacted, and the principles of monasticism more distinctly asserted in contravention of those traditional among the secular clergy. Leo's pontificate closed, however, ingloriously. In an evil hour he ventured to oppose the occupation by the Normans, whose encroachments on Italy were just commencing. His ill-disciplined forces were no match for the Norman bands, composed of the best warriors of the age. He was himself made prisoner, detained for nearly a twelvemonth in captivity, and eventually released only to die, a few

days after, of grief and humiliation. But, although his own career terminated thus ignominiously, the services rendered by Leo to the cause of Roman Catholicism were great and permanent; and of his different measures none contributed more effectually to the stability of his see than the formation of the College of Cardinals. The title of "cardinal" was not originally restricted to dignitaries connected with the Church of Rome, but it had hitherto been a canonical requirement that all who attained to this dignity should have passed through the successive lower ecclesiastical grades in connexion with one and the same foundation; the cardinals attached to the Roman Church had consequently been all Italians, educated for the most part in the capital, having but little experience of the world beyond its walls, and incapable of estimating church questions in the light of the necessities and feelings of Christendom at large. By the change which he introduced Leo summoned the leaders of the party of reform within the newly-constituted college of cardinals, and thus attached to his office a body of able advisers with wider views and less narrow sympathies. By their aid the administration of the pontifical duties was rendered at once more easy and more effective. The pontiff himself was liberated from his bondage to the capital, and, even when driven from Rome, could still watch over the interests of both his see and the entire church in all their extended relations; and the popedom must now be looked upon as entering upon another stage in its history—that of almost uninterrupted progress to the pinnacle of power. According to Anselm of Lucca, it was during the pontificate of Leo, at the synod of Rheims above referred to, that the title of "apostolic bishop" (*Apostolicus*) was first declared to belong to the pope of Rome exclusively. The short pontificate of NICHOLAS II. (1059-61) is memorable chiefly for the fundamental change then introduced in the method of electing to the papal office. By a decree of the second Lateran council (1059), the nomination to the office was vested solely in the cardinal bishops—the lower clergy, the citizens, and the emperor retaining simply the right of intimating or withholding their assent. It was likewise enacted that the nominee should always be one of the Roman clergy, unless indeed no eligible person could be found among their number. At the same time the direst anathemas were decreed against all who should venture to infringe this enactment either in the letter or the spirit. The preponderance thus secured to the ultramontane party and to Italian interests must be regarded as materially affecting the whole subsequent history of the popedom. The manner in which it struck at the imperial influence was soon made apparent in the choice of Nicholas's successor, the line of German popes being broken through by the election of Anselm, bishop of Lucca (the uncle of the historian), who ascended the pontifical throne as ALEXANDER II. (1061-73) without having received the sanction of the emperor. His election was forthwith challenged by the latter, and for the space of two years the Roman state was distracted by a civil war, Honorius II. being supported as a rival candidate by the imperial arms, while Alexander maintained his position only with the support of the Norman levies. The respective merits of their claims were considered at a council convened at Mantua, and the decision was given in favour of Alexander. Cadalous, such was the name of his rival, did not acknowledge the justice of the sentence, but he retired into obscurity; and the remainder of Alexander's pontificate, though troubled by the disputes respecting a married clergy, was free from actual warfare. In these much vexed questions of church discipline Alexander, who had been mainly indebted for his election to Hildebrand, the archdeacon of the Roman Church, was guided entirely by that able churchman's

The College of Cardinals.

Change in the method of election.

advice, and in 1073 Hildebrand himself succeeded to the office as GREGORY VII¹ (1073-85). From the memorable struggle between this pontiff and the emperor, Henry IV., we date the commencement of that long series of contests between the papal and the imperial power which distracted alike the holy see and the empire. In the two main objects to which his policy was directed—the enforcement of a celibate life among the clergy and the prohibition of investiture (see INVESTITURE) by the laity—Gregory had on his side the sympathy of the best and most discerning minds of his age. Lay investiture was little more than a cloak for the inveterate and growing abuse of simony, for which the distribution of church patronage by secular potentates afforded special facilities, and the burden of which was now increased by those other forms of tribute, the “regale,” “jus spolii,” and “servitium,” which the growth of the feudal system had developed. But in the hands of Gregory this scheme of ostensible reforms expanded first of all into independence of the temporal power, and finally into a claim to dominate over it. Other schemes (not destined to be realized) engaged his lofty ambition—the conquest of Constantinople, the union of the Eastern and Western Churches, and the expulsion of the Saracens from Christendom. He died in exile; but the theory of his office and its prerogatives which he asserted was brought by his successors to a marvellous realization.

The crusades in relation to the papacy.

The first crusade, which may be looked upon as generated by Gregory's example and a reflex of the policy which led him to sanction the expedition of William of Normandy against England, materially favoured papal pretensions. It was proclaimed as a religious war, and it was as a mode of penance that the Norman and Latin warriors were enjoined to gratify their ruling passions of plunder and adventure. More especially it brought to the front of the drama of European action the Latin as opposed to the Teutonic elements,—the part taken by Germany in these gigantic expeditions in no way corresponding to her position among European powers. It was impossible that the excommunicated emperor Henry IV. should place himself at the head of such an enterprise, and it was accordingly by URBAN II. (1088-99) that the direction was assumed, and it was under his auspices that the first crusade was proclaimed at Clermont. As the movement gathered force, the prestige of the popedom was still further enhanced by the fact that the warriors who had before appeared in the field under the banners of the empire now did so as loyal sons of the church. The new orders of chivalry,—the Knights of St John, the Templars, the Teutonic Order,—each bound by religious vows, received their commissions from the pontiff, were invested by him with the sword and the cross, and acknowledged no allegiance to the emperor.

The Decretum of Gratian.

Growth of the canon law.

But of all the schemes which Gregory's genius conceived and promoted none was more important in its after-effects than the expansion given to the pseudo-Isidorian decretals—in the first instance by Anselm of Lucca, again by Cardinal Deusdedit, and finally by the celebrated Gratian, a monk of Bologna, who lived about the middle of the 11th century. By Gratian these accumulated forgeries were reduced to order and codified; and his *Decretum*, as it was termed, stands to the canon law (CANON LAW) in much the same relation that the Pandects of Justinian stand to the civil law. Further additions were subsequently made by Gregory IX., Boniface VIII., and other pontiffs, and in this manner a vast code was gradually elaborated which, serving as the framework of the ecclesiastical jurisdiction in every land, was associated with

¹ In assuming this name Hildebrand designed to imply that Gregory VI., whose title had been cancelled by Henry III. on account of simony, was a legitimate pontiff.

separate courts and professed by a distinct body of jurists. The canonists were naturally ardent defenders of the system from whence they derived their professional existence, and everywhere represented the faithful adherents of Rome.

Another movement at this period, which gave effective aid in the diffusion of the papal influence and authority, was the rise of the new religious orders,—the Camaldules (c. 1012), the Cluniacs (c. 1048), the Carthusians (c. 1084), and the Cistercians (1098). Although each of these orders professed a distinct rule, and a sanctity and austerity of life which put to shame the degenerate Benedictines, their presence was far from proving an unmixed benefit to the districts where they settled. They rejected the episcopal jurisdiction, and purchased their local independence by complete and immediate subjection to the pope. Wherever, accordingly, their houses rose there was gathered a band of devoted adherents to Rome, ever ready to assert her jurisdiction in opposition to the ecclesiastical jurisdiction claimed by the secular clergy or the civil jurisdiction claimed by the temporal power.

Rise of new monastic orders.

On the death of Urban, Cardinal Rainerius, a native of Tuscany, and a man of considerable learning and capacity, succeeded as PASCHAL II. (1099-1118). During the earlier years of his pontificate he is unfavourably distinguished by the manner in which he sanctioned, if he did not instigate, the cruel and unnatural revolt of the young prince Henry (afterwards the emperor Henry V.) against his father. The later years of Paschal's rule seem mainly a record of the nemesis which overtook a policy dictated by the most heartless and selfish ambition. “Paschal,” says Milman, “is almost the only later pope who was reduced to the degrading necessity of being disclaimed by the clergy, of being forced to retract his own impeccable decrees, of being taunted in his own day with heresy, and abandoned as a feeble traitor to the rights of the church by the dexterous and unscrupulous apologists of almost every act of the papal see.” One of the most memorable phases of this long process of humiliation is marked by the treaty of Sutri (Feb. 1111), when the young emperor compelled Paschal to surrender all the territorial possessions and royalties which the church had received either from the emperor or from the kings of Italy since the days of Charlemagne, together with numerous other political and fiscal privileges, while he himself renounced the right of investiture. The indignation of the ecclesiastical world compelled Paschal to retire from this treaty, and ultimately, after long evasions, to become party to a second, whereby the former conditions were completely reversed. The emperor resumed the right of investiture, and that burning question again lit up the flames of war. Paschal being too far pledged by his own solemn oath, a metropolitan council assembled at Vienne assumed to itself the authority of excommunicating the emperor, declaring that the assertion of the rights of lay investiture in itself constituted a heresy. The great prelates of Germany rose in insurrection against the emperor. He retaliated by seizing on the vast possessions (comprising nearly a quarter of Italy) which Matilda, countess of Tuscany, at her death in 1115, had bequeathed to the Roman see. The pope and the cardinals responded by re-enacting the sentence of excommunication. Henry occupied Rome; and Pope Paschal died in the Castle of St Angelo, exhorting the cardinals with his latest breath to greater firmness than he himself had shown in maintaining the rights of the church. Paschal was the first of the pontiffs to discontinue the use of the imperial years in dating his acts and encyclicals, substituting instead the year of his own pontificate. The short rule of CALIXTUS II. (1119-24), disgraced although it was by the savage II. revenge which he perpetrated on his rival the antipope

Paschal II.

Calixtus II.

Gregory VIII., was characterized by wise and resolute administration. A Frenchman by birth, he was the first to establish those intimate relations with France which rendered that state the traditional ally of the Roman see, and culminated in the secession to Avignon. Germany, on the other hand, appears from this time as generally heading the anti-papal party, espousing the cause of the antipope, and siding with Ghibelline faction. But the chief event in the pontificate of Calixtus, and one which may be looked upon as inaugurating a new era in the history of our subject, was the Concordat of Worms of the year 1122.

Concordat
of Worms.

By this memorable treaty, which, accepted as the law of Christendom, seemed to promise an ultimate conclusion of the long struggle, an understanding was at last arrived at. The emperor ceded the right of investiture by the ring and the pastoral staff,—thereby renouncing that at which the church most demurred, the appearance of assuming to be in any way the transmitter of the spiritual succession, but retaining the right of granting church benefices or other property by the symbol of temporal power, the sceptre. The pope, on the other hand, consented that the election of bishops and abbots should take place, according to canonical procedure in the presence of the emperor, but that neither bribery nor compulsion should be resorted to, and that, in the case of disputed elections, there should be a right of appeal to the metropolitan and provincial bishops. In Germany the investiture with the regalia by the sceptre was to precede the consecration, the dependence of the higher clergy being thus secured to the emperor; but in other countries the lay investiture was to take place within six months after consecration. In an appended clause a reservation was made which afterwards became a fruitful germ of controversy: the elected dignitary bound himself to discharge his feudal obligations to the emperor arising out of his investiture with the temporalities, “except in all things which are acknowledged to belong to the Roman Church.”

During the pontificate of INNOCENT II. (1130–43) the importance of the new relations established with France are to be seen in the all-commanding influence of BERNARD OF CLAIRVAUX (*q.v.*), the unswerving supporter of the papal claims, round whose career indeed the life of the Western Church for half a century may be said mainly to revolve. In the struggle, arising out of his disputed election, with the antipope, Anacletus II., Innocent succeeded in gaining the support of Bernard, and through Bernard that of the emperor Lothair; and the narrative of his restoration to his see by the imperial forces, after an exile of four years, is one of the most dramatic episodes in papal history. Technically, at least, Anacletus had the better claim to the papacy, having been elected by a majority of the cardinals; but Innocent secured the support of Lothair by making over to him the territory bequeathed by the countess Matilda. In return for this concession, Lothair accepted the imperial crown from Innocent in the church of the Lateran, and acknowledged himself the pope's vassal,—in the language of the inscription recording the event, “Post homo fit Papæ, sumit quo dante coronam.”

Bernard
of Clair-
vaux.

The change in the imperial dynasty, involving as it did the setting aside of Lothair's son-in-law as emperor, revived the rivalry between the empire and the papacy; and the Ghibellines, or adherents of the Hohenstaufen (or Swabian) line, now represented a more distinctly defined party in opposition to the Guefs, who sustained the traditional policy of the Saxon imperial line, and sided with the popes. Frederick Barbarossa, although he consented to receive the imperial crown at the hands of HADRIAN IV. (1154–59), required that pontiff altogether to disavow the notion of having conferred it as a *beneficium* upon a vassal, maintaining that, through the election of the princes, he held his crowns (both kingly and imperial) of God alone.

Renewal
of the
struggle
with the
empire.

During the pontificate of ALEXANDER III. (1159–81) Frederick supported the cause of the antipopes. A disputed election, in which the merits of the candidates are even yet more difficult to determine than in the election of Innocent II., gave rise to a series of counter claims, and Alexander, during his long pontificate, had to contend with four successive antipopes each backed by the imperial arms. Only the election of the first, Victor V. (antipope, 1159–64), however, had real canonical validity, the claims of the others having always been regarded by all orthodox Catholics as presumptuous. It was during the latter part of Alexander's government that Rome achieved a great moral triumph in England in the reaction which followed upon the murder of Thomas Becket and the abrogation of the Constitutions of Clarendon. Eight years later the attention of all Christian Europe was riveted by the memorable occurrence which marked the consummation of the truce of Venice (1178), when Frederick Barbarossa prostrated himself before the aged pontiff and held his stirrup as he mounted his palfrey.

Passing by the comparatively unimportant careers of the five popes whose names stand between those of Alexander and INNOCENT III. (1198–1216), we find ourselves at the stage which marks the culmination of the papal power. III. The august descent of this pontiff; his learning as a canonist and his commanding genius; the interdicts which he could venture to impose on great realms, whether ruled by the astute sagacity of a Philip Augustus or by the reckless folly of a John; his sentences of excommunication, hurled with deadly effect at emperor and at kings; the vigour with which he wrested whole provinces from the imperial domination—the march of Ancona and the duchy of Spoleto—to weld together into one compact whole the Patrimonium and the Romagna; the energy with which he repressed the heresies which threatened the unity of the church; the boldness with which he defined the doctrine of transubstantiation; his patience in working and waiting for opportunities, and the promptitude with which he seized the occasion when it arrived,—such are the features which combine to render the eighteen years' pontificate of Innocent III. a period of unrivalled lustre and importance in the history of the popedom. It was now that the papal power may be said to have effectually impressed its theory of sacerdotal government upon Europe; that the canon law, wherein that theory was elaborated, began to be taught in the universities which rose throughout Europe—Bologna, Padua, Paris, Orleans, Oxford, and Cambridge; that ecclesiastical discipline everywhere modelled itself on the practice of Rome; that the mendicant orders, especially those of St Dominic and St Francis of Assisi, with their irregular enthusiasm, skilfully converted by Innocent into a widely-diffused, untiring, and devoted propaganda, roused a new spirit alike in the universities and among the illiterate laity, and became a powerful instrument wherewith to coerce to obedience the episcopal order and the whole body of the secular clergy.

The chief interest attaching to the pontificates of The Honorus III. (1216–27), GREGORY IX. (1227–41), and emperor INNOCENT IV. (1243–54) arises from their connexion with Frederick II. the policy and career of Frederick II. (emperor 1210–50). To the whole traditions of the popedom Frederick was especially obnoxious, menacing on the one hand its standard of doctrine by his reputed scepticism, and its newly acquired possessions on the other by his schemes for the revival of imperial supremacy in Italy. In the sequel his designs were baffled by the ability and resolution of Gregory and Innocent; and at the general council of Lyons (1245) Frederick was deposed both from his imperial and his kingly dignities, and his subjects declared to be absolved from their fidelity. In this manner the power claimed by

the Roman pontiff of deposing even kings received the implicit sanction of a general council. The empire, worsted in Italy, broke down in Germany. In 1268 Conradin, the grandson of Frederick and the last representative of the Hohenstaufen dynasty, was cruelly put to death by Charles of Anjou, and the long contest of the empire with the popedom came to an end.

Gregory X. The policy of GREGORY X. (1271-76), a man of ability and moderation, deserves the praise of having apparently aimed at the general good of Christendom, so far, at least, as not incompatible with the overweening pretensions which he continued to uphold. Gregory endeavoured to compose the bitter jealousies and long-continued strife of the Italian states by the establishment of a general protectorate under Charles of Anjou, king of Naples, and to reconcile Guelf and Ghibelline by concessions to the leaders of the latter party. He effected a temporary agreement with the Eastern Church; and he sought to put an end to the abuses and rivalries which now almost invariably accompanied each election to the pontificate by introducing a new method of proceeding on such occasions. In the meantime, the growing spirit of nationality had already received a striking exemplification in France by the enactment of the Pragmatic Sanction (1268). Of this measure, which has been described as the foundation of the Gallican liberties, it will here suffice to say that it consists of a series of enactments expressly directed against all those encroachments of the popedom with respect to collations to benefices, elections to bishoprics, simoniacal practices, ecclesiastical promotions, imposts, and other forms of exaction, such as we have already noted in their gradual growth. Shielded from criticism by the fact that it was sanctioned by the pious Louis IX., the loyal son of the church, the Pragmatic Sanction passed at the time unchallenged even by the papacy itself. Of the extent to which the latter was becoming more and more a political institution we have striking evidence in the brief pontificate of CELESTINE V. (1294). A hermit of the Abruzzi, of austere and holy life, he had been elected pope in the hope that his reputation for virtue might in some measure restore the character of his office. Something more, however, than mere sanctity and blamelessness were now necessary for the discharge of the duties of a position which by its associations demanded the exercise of statecraft, political intrigue, and a wide knowledge of affairs. In less than six months Celestine resigned an office for which by lack of experience and ability he was altogether unfitted, but leaving behind him a tradition of self-devoted and holy life which found expression in the institution of a new religious order, that of the Celestians, afterwards blended with the Fraticelli, or Spiritual Franciscans. Upon BONIFACE VIII. (1294-1303) the signs of the times and the development of a spirit and of institutions incompatible with the pretensions of his predecessors were altogether lost. A man of considerable abilities, indomitable will, and imperious nature, he enunciated in yet more uncompromising terms the theory of the papal supremacy. In the memorable bull *Unam sanctam Ecclesiam* (18th Nov. 1302), he declared that the church could have but one head—a two-headed church would be a monstrosity; and he explained away the traditional interpretation of the symbolic meaning of the two swords, by affirming that the temporal sword wielded by the monarch was borne only at the will and by the permission of the pontiff (*ad nutum et patientiam sacerdotis*). Dazzled by the apparent success which attended his first measures, he was only confirmed in his policy by the resistance he encountered in France and England. In Philip the Fair, however, he was matched with an antagonist as resolute and unscrupulous as himself and one who better understood the tendencies of the

The Pragmatic Sanction.

Boniface VIII.

age. In the struggle that ensued Philip had the whole French nation, including the episcopal order, on his side; the pontiff was worsted, and his humiliation and sense of defeat hastened his end.

With the death of Boniface fell also the papacy of the Middle Ages, both in theory and in fact:—in theory, through the ascendancy of counter views such as those put forth in the *De Monarchia* of Dante, and in the writings of Ægidius Colonna and John of Paris, which enforced the reasonableness and necessity of the supremacy of the political power; in fact, from the manner in which the French monarch succeeded not only in repelling the papal pretensions but in eventually reducing the Roman see itself to be a mere instrument of his will and a submissive agent in the furtherance of his policy.

The origin, the growth, the characteristics, the assumptions, and the downfall of the mediæval papacy having now been traced out, it remains to note, as concisely as practicable, the chief features in the later history of the institution. In the year 1305 CLEMENT V. (1305-14), The an Aquitanian by birth, was elected after long contention to the pontificate. He was invested with the tiara at Lyons, and subsequently (1309) transferred his court from Rome to Avignon. The pressure put upon him by King Philip is generally assigned as the cause of this step, but it is not improbable that he was only too glad to escape from the strife then waging between the two great factions, the Orsinis and the Colonnas, at Rome. At Avignon, for a period of nearly seventy years, derisively styled the "Babylonian captivity," pope after pope held his court. Degraded to a state of splendid vassalage to France, their luxury, pride, rapacity, and avarice became a bye-word in Europe, while their complete subservience to the political aims of the French crown effectually alienated from them the good will and sympathy of England and Germany. When JOHN XXII. (1316-34) sought to interfere in a double election to the empire, the diet at Frankfort denounced his whole policy in terms that startled Europe by their boldness; and the electoral union at Rense in 1338 passed a resolution declaring that "whoever was chosen by the electors became at once both king and emperor, and did not require that his election should be approved and sanctioned by the apostolic see." Other causes contributed effectually to lower the papacy in the estimation of Europe. Clement V. concurred in the infamous devices by which Philip procured the suppression of the Order of the Templars, and the barbarous cruelties inflicted on the noble victims produced in the popular mind a feeling of deepest aversion for the authors of those proceedings. The traffic in benefices was now again developing into a gigantic scandal and abuse. Annates and Peter's pence were exacted with an insatiable rapacity. Italy itself, indeed, torn between contending parties and impoverished by the interruptions to commerce, offered but a barren field for plunder, but in the countries north the Alps the pope's emissaries were everywhere to be seen, ever intent on their errand of exaction. The wealth thus acquired was partly devoted towards extending the territorial possessions of the see; and Avignon and the county of Venaissin, purchased in 1348 from the crown of Provence, remained papal until the French Revolution. It is not a little significant that this increase in wealth and territory should have been concomitant with the sinking of the moral influence of the papacy to its lowest ebb. In England the civil power endeavoured to check this system of extortion by re-enacting the Statutes of Præmunire and Provisors. In Germany the deep discontent to which it gave rise formed an important contributing element in the causes which brought about the Reformation. In France the luxury and gross immorality of the

Growth of abuses in the church.

court at Avignon, described in graphic and scathing language by Petrarch, are assigned by other contemporary writers as conducing largely to the corruption of morals throughout the realm. Even among the religious orders themselves there began to be signs of insubordination, and the Fraticelli, or Spiritual Franciscans, who now took their rise, openly avowed that the principles which they professed were designed as a protest against the appalling degeneracy of the curia; while great scholars in the universities, like William of Occam and Marsilio of Padua, brought the dialectics and new philosophical tenets of the schools in the universities to bear with no little effect on the whole system of the popedom.

The
great
schism.

The outbreak of the great schism struck no less deeply at those sentiments of veneration and deference which had been wont to gather round the pontiff's chair. The majority in the college of cardinals were Frenchmen, and, on the death of Gregory XI in 1378, it seemed only too probable that another Frenchman would be elected his successor. The discontent of the citizens of Rome at the withdrawal of the curia from the capital had now, however, reached a culminating point. This feeling, it is to be noted, was by no means one of mere sentiment and attachment to tradition, for the diversion of appeals, pilgrimages, deputations, and embassies, with their attendant influx of travellers, and of large streams of wealth and business from Rome to Avignon, had materially affected the prosperity of the former city. On the occasion of the new election the prevailing dissatisfaction found vent in menacing demonstrations on the part of the population, and even in scenes of actual violence. In order to appease the city the terrified cardinals determined on the unanimous election of an Italian, Frignani, archbishop of Bari, who assumed the title of URBAN VI. The election was singularly unfortunate. The new pontiff, intoxicated by his sudden and unexpected fortune, assumed such arrogance of demeanour and showed himself so altogether wanting in moderation and self-control that the cardinals put forth the plea that they had discharged their function as electors under intimidation, and declared the election invalid. In proceeding to elect another pontiff, their choice fell upon one of their own number, Robert of Geneva, known as CLEMENT VII. (1378-94). For a period of thirty-eight years, Christian Europe was scandalized by the contentions of two rival popes, the one holding his court at Rome, the other at Geneva, each hurling anathemas, excommunication, and the foulest accusations at the other, and compared by Wyclif to "two dogs snarling over a bone"—a simile which in itself affords significant proof of the manner in which the popedom had fallen in the estimation of Christendom. The potentates of Europe, in declaring themselves "in the obedience," as it was termed, of one or the other pontiff, were swayed almost entirely by political considerations, in which jealousy of France was the predominant sentiment. Italy, Germany, Bohemia, England, Flanders, Hungary, and Poland, all declared themselves in the obedience of the pope at Rome; Scotland, Savoy, Lorraine, declared themselves, along with France, in that of the pope at Avignon. The Spanish kingdoms, which at first stood aloof, ultimately also decided, though from somewhat different motives, in favour of the latter pontiff. At last, at the commencement of the 15th century, an endeavour was made to prevail on both the reigning popes—Gregory XII. at Rome, Benedict XIII. at Avignon—to renounce their claims, with a view to the restoration of church union. The proposal was met by both popes with persistent and unscrupulous evasion. France, indignant at the subtleties of Benedict, withdrew her support, and he accordingly retired to Perpignan. The cardinals attached to either

court met together at Leghorn, and agreed to summon a general council, to meet at Pisa on the 25th March 1409. In the meantime isolated scholars and divines throughout Europe, among the regular and the secular clergy alike, were pondering deeply the lesson taught by the papal history of the last six centuries, and in the place of the traditional theories of appeals to popes, to councils, or to emperors there was growing up another conception, that of the essential falsity of the axioms on which the theory of the papal supremacy had been built up, and of Scriptural authority as the only sure and final source of guidance in deciding upon questions of doctrine and morality.

But as yet, before ideas such as these had been sufficiently developed and events had prepared the popular mind for their reception, the remedy that most commended itself to the leading minds of Christendom was that of a true general council. Such was the idea which influential churchmen of the age—men like Peter D'Ailly, cardinal of Cambrai, and John Gerson, chancellor of the university of Paris, who, while they deplored the discipline, still assented to the doctrines of the church—believed to be the best solution of the difficulties in which that church had become involved. The opinions of the doctors of the canon law and of theology at the universities had been taken, and at Oxford as in Paris it had been decided that a general council might be summoned even against the will of the pope, and that, when thus convened, its authority was superior to his. Such were the circumstances under which in 1409 the council of Pisa was summoned. The council enunciated the dogma of its own supremacy; it deposed the rival popes; it constituted the two separate bodies of cardinals a single conclave, and by this conclave a new pope, ALEXANDER V. (1409-10) was elected. Schemes of general ecclesiastical reform were discussed; and then after a four months' session the assembly adjourned, to resume, at an interval of three years, its yet more memorable deliberations at Constance. In the intervening time, Alexander V. died, not without strong suspicion of his having been removed by poison through the machinations of his successor, the notorious Balthasar Cossa, who assumed the title of JOHN XXIII. (1410-15), and took up his residence in Rome. It is with this pontiff that the gross abuse of indulgences is said to have first arisen. In the year 1416 the council of Constance met, amid the most sanguine expectations on the part of religious Europe, but it achieved practically nothing in the direction of church reform. It deposed John XXIII, but MARTIN V. (1417-31), by whom he was succeeded, although in some respects an estimable pontiff, skilfully availed himself of the disturbances in Bohemia and the hostile inroads of the Turks to postpone all questions of reform to a future occasion. On the other hand, the actual results of its deliberations were reactionary in their tendency. The council burned John Huss, one of the first to assert the rights of the individual conscience in opposition to the prevailing hierarchical system; it crushed the party of reform in the university of Paris, and banished their great leader. The council of Basel (1431-49), although it re-enunciated the principle of the superiority of a general council over the pope, found, when it sought to proceed to the more practical reforms involved in placing restrictions on the abuses practised under the papal sanction, that it had assumed a task beyond its powers. Under the pretext of bringing about a reconciliation with the Eastern Church, and inviting its delegates to the deliberations of the council, EUGENIUS IV. (1431-47) proposed to transfer the place of meeting from Basel to some Italian city. The council, well knowing that such a measure would be fatal to its independence, refused its assent; Eugenius retaliated by dissolving the council; the council, by

suspending the pope. Thereupon Eugenius summoned another council at Ferrara, which was afterwards removed to Florence. The council of Basel, as a last resource, arrogated to itself the papal functions, and then proceeded to elect Amadeus, duke of Savoy, pope, with the title of FELIX V. In this extreme measure it failed, however, to carry with it the more influential European powers. Germany, after an ineffectual endeavour to mediate between the rival popes, assumed, in the first instance, an attitude of strict neutrality, but was ultimately won over by the crafty Æneas Sylvius (afterwards Pius II.) to conclude the notable Concordat of Vienna (1448). By this mercenary arrangement the newly-elected emperor, Frederick III., altogether renounced whatever advantages had, down to that time, been gained by the labours of the council of Basel, receiving in return from Nicholas V. certain concessions with respect to all episcopal elections in his own hereditary dominions, together with a hundred of the most valuable benefices, the visitatorial rights in relation to the monasteries, and a tenth of the monastic revenues. The policy adopted by France was of an altogether different character. She preferred to adjust her ecclesiastical liberties on the basis defined and sanctioned by the royal authority at the congress of Bourges. The Pragmatic Sanction there enacted was registered by the parliament of Paris, 13th July 1439,—thus becoming part of the statute law of France. In this celebrated manifesto the spirit of Gerson and the university of Paris spoke again; but, while its twenty-three provisions rendered it peculiarly obnoxious to the Roman see, the manner in which it set aside all royal nominations made it no less distasteful to the monarchy. Louis XI., feigning to yield to the pressure put upon him from Rome, abolished it, but it was re-enacted by Louis XII. Eventually, in the year 1516, amid the full flow of the advantages which he had gained by the victory of Marignano, Francis I. permitted the Pragmatic Sanction to be superseded by the Concordat of Bologna,—a disastrous compromise of principles, wherein, while some important concessions were made to Leo X., the crown interference with the administration of the church was more effectually established than ever, and the independence of the Gallican clergy reduced to a shadow. The concordat made no mention of the councils of Constance, Basel, and Bourges, or of their fundamental conception of the superiority of a general council over the pope; and it left the opportunity open for the reintroduction of annates. On the other hand, the monarchical authority achieved a signal triumph; and, although the parliament of Paris loudly protested, and even ventured to set aside some of the royal nominations subsequently made, its voice was silenced by a peremptory decree issued in the year 1527.

To return to the council of Basel. Although supported at first by the electors of Germany, it was, in the sequel, completely circumvented by the machinations of the able but unscrupulous Æneas Sylvius; and Pope Eugenius, at his death, seemed almost to have regained the allegiance of Christendom. Under NICHOLAS V. (1447–55), the work of reunion was brought to a completion. The council of Basel dissolved itself; and Felix V., laying aside his empty title and dignity, retired into Savoy, and was shortly after promoted to the rank of cardinal by Nicholas himself. The popedom was not destined ever again to witness the phenomenon of a rival pontiff; and no council since the council of Basel has ever ventured to assert its authority as superior to that of the Roman chair. At the council of Florence that theory had been definitely contravened (1439) by the enunciation of the following canon, in which the counter theory first received a complete and distinct exposition:—"We define the holy

apostolic see and the Roman pontiff to have primacy over the whole earth, and the Roman pontiff to be himself the successor of the blessed Peter, chief of the apostles, and the true vicar of Christ, and to exist as head of the whole church and father and teacher of all Christians; and that to him, in the blessed Peter, our Lord Jesus Christ has committed full power of feeding, governing, and directing the universal church, even as is [also]¹ contained both in the acts of the œcumenical councils and in the sacred canons."

Thus re-established and confirmed in his own theory of his office and its functions, the Roman pontiff regained somewhat of his former hold on the estimation of Europe. There was also at the same time discernible a marked improvement, so far as regarded external decorum, in the associations of the curia; and, until the ascendancy of the Borgias, the names of NICHOLAS V. (1447–55), PIUS II. (1458–64), and SIXTUS IV. (1471–84) redeemed the reputation of the Roman see, if not for sanctity, at least for learning. The last-named pontiff, however, lies under the imputation of having been the first to institute trials for witchcraft, an example which spread, in later times, far wider than the boundaries of Roman Catholicism itself. In the latter half of the 15th century the popedom retires altogether into the background of European history. The pretensions of the pontiff were not, indeed, in any way retracted or modified, but his actual policy was no longer commensurate with these, and the former weapons of the interdict and the anathema had fallen into disuse. The popes became little more than territorial princes, their political and ecclesiastical influence being exerted mainly with reference to the material interests of the States of the Church. It was one of the most baneful results of these changed external relations that each more ambitious pontiff—the Farnesi, the Borgias, the Della Roveres, and the Medici—aspired to found an hereditary sovereignty or principality in connexion with his own family, and the most valuable possessions of the church were successively alienated. By the next pontiff the holders of such property would be not unjustly regarded as usurpers, and it would be the first aim of himself and his party to eject them from the lands and revenues thus acquired. In this manner deadly feuds were generated, which became hereditary in the different families, and proved an unfailing source of sanguinary feuds and bitter animosities.

With the tacit surrender of the theory of the supremacy of general councils, the Holy Roman Empire itself came also virtually to an end; and Germany, broken up into a number of independent principalities, often involved in internecine strife, presented a striking contrast to the advances which France and Spain were making in the direction of consolidation and order. The papacy found a direct apparent advantage in fomenting this disunion, and in no country were the exactions of its emissaries more shameless or extortionate. Eventually, however, both these phases of its policy proved eminently detrimental to the Roman interests. For, while the unscrupulousness of its agents did much to foster a strong aversion to the tenets which they inculcated, and thus paved the way for the reception of Lutheran doctrines, the isolation to which

The
papal
policy in
Germany.

¹ Καθ' ὃν τρόπον καὶ ἐν τοῖς πρακτικοῖς τῶν οἰκουμενικῶν συνόδων καὶ ἐν τοῖς λόγοις κήρυξι διαλαμβάνεται. For a long time these words were correctly rendered in the Latin, "quem ad modum et in gestis œcumenicorum conciliorum et in sacris canonibus continetur," and the passage is invariably thus quoted by the 15th and early 16th century theologians. In the Roman edition of Abraham Cretensis, however, the obvious meaning of the Greek, viz., that the prerogatives of the pope are to be determined and exercised according to the canons of the ancient councils, is done away with by the change of *et* to *etiam*; and the sense of the passage (which thus becomes merely a confirmatory reference) is, that the prerogatives enumerated belonged to the pope, and were also recognized in the ancient councils.

each German state was reduced proved favourable to its freer action, and enabled it, in no small measure, to pursue that independent policy which, in several instances, materially aided the progress of the Reformation. The history of the popedom from this point (c. 1517) to the commencement of the council of Trent (1545) will be found in the article on the REFORMATION.

Council of Trent. The distinctive features of the doctrinal belief formulated by the council of Trent were mainly the outcome of Jesuit influences (see JESUITS); and, enforced as these tenets were by the terrorism of the Inquisition, the freedom of thought which during the revival of learning had passed comparatively unchallenged within the pale of the church was now effectually extinguished. But it must at the same time be admitted that, concurrently with this tendency to greater rigidity of doctrine, Roman Catholicism became characterized by far greater earnestness of religious teaching, displayed a remarkable activity in the cultivation of theological learning, and abolished, or sought to abolish, many glaring abuses. In this amendment, however, Rome had at first but small share. The Reformation movement within the church took its rise in Spain; and the purely political feeling which now constituted so considerable an element in the papal policy led each pontiff to regard with no little jealousy the overweening aggrandizement of the Spanish monarchy. Political considerations, in fact, sometimes prevailed over theological sympathies. PAUL III. (1534-49), in endeavouring to trim his sails between the contending influences of France and Spain, more than once took side with the powers who were fighting the battle of Protestantism.

Increased hostility of the papacy to free thought. While thus involved in antagonism to the chief of the Catholic powers, the Roman see found its difficulties not a little enhanced by the alienation of the revenues formerly derived from those countries which now professed the Protestant faith. Prior to the 16th century the States of the Church had enjoyed an almost unrivalled prosperity. That prosperity was mainly owing to their immunity from direct taxation. Nothing had contributed so much to the unpopularity of Hadrian VI. as his endeavour to levy a small hearth-tax, in order to replenish to some extent the coffers emptied by the prodigality of his predecessor. The loss of the revenues alienated by successive pontiffs was now aggravated by the failure of the supplies derived from the collection of Peter's pence and annates in Protestant countries. Even the sums levied in those kingdoms which continued to profess Catholicism suffered considerable diminution before they reached the Roman treasury, and the main source of revenue at this period appears to have been that represented by the sale of offices. In the serious financial embarrassment in which the curia now found itself involved, every expedient was had recourse to in order to meet the inevitable expenditure; and it is to the example of the papal treasury that Von Ranke attributes the commencement of national debts. In default of the contributions no longer levied in England, in the United Provinces, and in northern Germany, the pope found himself under the necessity of taxing his own territory; and in this manner the Romagna, once so prosperous, was crushed by a weight of taxation which ultimately embraced every article of merchandise. The farmer and the peasant left the land; and the papal provinces, formerly the most fertile and prosperous in Italy, degenerated into a series of ill-cultivated, unwholesome, and unproductive wastes.

Financial difficulties and expedients. If left to rely solely on the loyalty of its adherents and the prevalent impression of its abstract merits, the position of the popedom at this period, viewed in connexion with its financial difficulties, might well have seemed almost hopeless, had not its interests been so closely interwoven

with those of the secular power. The latter indeed was frequently induced to connive at the papal exactions from the mere fact that it shared largely in the proceeds; and in France the very advantages gained by the crown led it to regard with complacency a system by which the royal influence and the royal revenues were alike so largely augmented. The temporal ruler was thus sometimes found a firm supporter of the popedom, even although involved in hostilities with the reigning pope.

During the pontificate of JULIUS III. (1550-55), who dreamed away his closing years in the splendid palace and gardens which he had himself designed near the Porta del Popolo, the curia played a merely passive part in the great European drama; but with the accession of Cardinal Caraffa, who assumed the title of PAUL IV. (1555-59), Paul IV. it became animated by another spirit. An energetic supporter of the doctrines already promulgated by the council of Trent, devoted to the cause of the church, but hating the Spaniard with the traditional hatred of a Neapolitan, his support was given entirely to the French interests in European politics. He proclaimed himself at once the liberator of Italy and the reformer of the church. In his plans of reform, although he relied mainly on the Inquisition, he included alike the monastic orders and the secular clergy. His successor, PRUS IV. (1559-65), Pius IV. although a man of different character, pursued a similar policy. The council of Trent assembled again under his auspices, but its discussions now concerned only points of Roman doctrine and discipline, and the rupture with the Protestant communions was complete. With the accession of PRUS V. (1566-72), who had filled the office of Pius V. chief inquisitor in Rome, the conditions of the papal policy had become less embarrassing. Spain now stood at the head of the Catholic powers, and England at the head of the Protestant. In France the issue of the deadly struggle that was being waged between the Huguenots and the League, which seemed likely to decide the religious destinies of Europe, was still doubtful. Philip II. accordingly appeared as the natural ally of the popedom, and Pius, having once accepted the position, remained true to this alliance throughout. The lavish expenditure of GREGORY XIII. (1572-85) brought back the former condition of financial embarrassment. He not only made large grants to aid the cause of Catholic education, and especially the newly-founded colleges of the Jesuits, but he systematically subsidized the powers who fought on the side of the church. Although the revenues of the papal states were again on the increase, the rate of exchange during Pope Gregory's pontificate was never once in their favour. At last the pressure became insupportable. The spirit of Guelf and Ghibelline revived. The Romagna rose in insurrection; and, eventually, the aged pontiff died broken-hearted amid the disorganization and lawlessness which surrounded him on every side. But already the tide of Protestantism was beginning to ebb; and the famous bull *In Cena Domini*, which Gregory promulgated in 1584, enjoining the extirpation of the different heresies in Germany, indicated the growing weakness of the Lutheran communities.

The five years embraced by the pontificate of SIXTUS SIXTUS V. (1585-90), the last of the really great pontiffs, mark another great crisis in the history of the popedom. At his accession, the papal authority had dwindled to its narrowest limits, being recognized scarcely anywhere save in Spain and Italy, and in a few islands of the Mediterranean. To his tact, ability, and good sense, conjoined with the widespread activity of the Jesuits, and aided by the dissensions that prevailed among the Protestant sects, Catholicism was mainly indebted for the remarkable reaction in its favour which set in with the

closing years of the 16th century—an episode of which the 7th book of Ranke's *History of the Popes* supplies a comprehensive sketch. Sixtus conciliated the great landed proprietors whom his predecessor had driven into insurrection by calling in question the validity of their title-deeds and by attempts to re-appropriate their lands; he repressed the prevailing brigandage with merciless severity; notwithstanding his lowly extraction, he succeeded in winning the favour of the great houses—the Colonnas and Orsinis; he developed the industries and manufactures of the States; no pontiff ever effected so much for the improvement and adornment of the capital; its population, which under Paul IV. had sunk to forty-five thousand, rose to one hundred thousand; “for the third time,” says Ranke, “Rome stood forth to view as the chief city of the world.” Another reform introduced by Sixtus was that by which the college of cardinals, before a fluctuating body, was definitely fixed at seventy. The inconsistencies of his foreign policy are probably to be partly explained by the fact that, although the promotion of the interests of the church was his most cherished object, he had conceived a thorough distrust of Philip II. At the same time, while he believed that those interests would be most effectually served by the establishment of peace and order, he necessarily regarded with aversion the revolutionary doctrines of the League, democratic in politics although ultramontane in doctrine. From Henry of Navarre, indeed, he could not withhold his tribute of admiration; and on the death of Henry III. he revoked the sentence of excommunication which he had pronounced against the great Huguenot leader, and by his general policy facilitated his return to the communion of the church. In like manner, although he sanctioned the scheme of the Spanish Armada, and even promised a magnificent subvention to the enterprise, as soon as he learned that, if successful, it might result in the annexation of England to the crown of Spain, he withdrew his support, and, when the failure of the expedition was known, could not conceal his satisfaction.

From the time of Sixtus V. the chief importance and interest of papal history are to be found in its relations to France and Spain and to the Jesuit order (see JESUITS, vol. xiii. pp. 652–656) and, somewhat later, to Jesuitism and Jansenism (see JANSENISM, vol. xiii. p. 566) combined. During the rest of the reign of Henry IV. France witnessed a virtual triumph of Gallican principles; and, although he himself became a humble suppliant for readmission within the communion of the Roman Church, it was only to give more effectual expression to the principles of religious toleration. The edict of Nantes (1598) was promulgated, in fact, in defiance of the strongly expressed disapproval of CLEMENT VIII. (1592–1605). The permission accorded to the Jesuits to return to France (1603) was a measure resolved upon by Henry in opposition to the advice of both De Thou and Sully. He appears to have been actuated simply by motives of expediency, but his expectations proved singularly fallacious. The Jesuits turned the opportunity thus afforded them to signal account, and succeeded in establishing a powerful ascendancy in France throughout the 17th and the first half of the 18th century. The pontificate of Clement was distinguished by two other events, the one memorable in politics, the other in literature. Of these, the former was the reversion of the duchy of Ferrara, claimed from the house of Este by the apostolic see as an escheated fief; the other was the publication of the greater part of the *Annales Ecclesiastici* of Baronius, a work of immense labour and research, which, although it could not stand the test of later criticism, rendered material support to the pretensions of the papacy. Baronius himself always maintained that

the papacy was more indebted to France than to any other European power; and on the death of Clement his claim to the papal chair was strongly supported by the French party in the conclave, his election being, however, lost through the opposition of the party of Spain.

It was chiefly by skilful manœuvring that, after the few days' pontificate of LEO XI., the election of the Cardinal Borghese, as PAUL V. (1605–21), was carried, notwithstanding the opposition of the same party. Paul's election had really been in no small measure owing to the fact that his previous career had not happened to involve him in enmity with any of the cardinals. It is stated that Cardinal Bellarmine would have been chosen in his place, but the conclave dreaded the consequences of raising a Jesuit to the papal chair. Paul affected, however, himself to regard his election as owing to the special intervention of Providence, and assumed the air and demeanour which he held suitable to one divinely commissioned to restore the pontifical office to its former dignity. No pontiff ever insisted with more inflexible rigour on the attributes and exclusive powers of his office. In the measures which he initiated for the purpose of extending the influence and possessions of the church, Paul soon found himself involved in a conflict with the powerful and flourishing republic of Venice. He accused the Signory of opposing the institution of monastic and other religious foundations, of conniving at the alienation of ecclesiastical property and at the suspension of the authority of the ecclesiastical courts. Finding those whom he addressed less amenable to his wishes than he anticipated, he proceeded to lay the whole republic under an interdict. Such a sentence rendered it obligatory on the religious orders throughout the province to discontinue all the customary religious services; the republic, however, enjoined them, under pain of banishment, to continue those services as before. The Jesuits, along with two other newly-founded orders, the Capuchins and the Theatines, alone ventured to disobey, and were banished from the province. A fierce controversy ensued, in which the conduct of the republic was vindicated by the able pen of Fra Paolo Sarpi (better known as “Father Paul”), while Baronius and Bellarmine defended the cause of Rome. By Englishmen at that time resident in Italy, such as Sir Henry Wotton and the eminent Bedell (afterwards bishop of Ardagh), and by the English court, the contest was watched with lively interest as affording hopes of an Italian Reformation. The quarrel was skilfully fomented by Spain, and actual hostilities were averted only by the mediation of Henry IV. of France. The later years of Paul's pontificate present him in the more favourable light of a reformer of many abuses which had crept into the law-courts of the States, and the author of numerous improvements in the capital. He enlarged both the Vatican and the Quirinal; and the Borghese family from his time ranked as one of the wealthiest in the city.

The protection extended to the Jesuits by Paul was continued by his successor, GREGORY XV. (1621–23), and was well repaid by their devotion and energy as propagandists. Gradually, in kingdom after kingdom, in principle after principle, the ground won by Protestantism, whether of the Lutheran or the Reformed confession, was in a great measure recovered. In Bohemia, in Silesia, and in Moravia the Protestant ministers, if not put to death or imprisoned, were driven out, their churches closed, and their congregations forbidden to assemble. Even in the United Provinces numerous converts were made, and a footing regained for Catholic teaching which has never since been lost, while in Asia and in America new territories were won which might fairly seem to compensate the church for all that had been wrested from

Urban
VIII.

it in the Old World. The cordial co-operation of the curia with the society of Jesus was suspended, however, during the pontificate of URBAN VIII. (1623-44). A man of resolute and imperious nature, his conception of his own prerogatives is indicated by his memorable retort, when, on one occasion, he was confronted with a quotation from the pontifical constitutions, that the dictum of a living pope was worth more than those of a hundred dead ones. He claimed, indeed, the promptest deference for his decisions; while the college of cardinals, which he but rarely assembled in consistory, was treated by him with little respect. A Florentine by birth, he had witnessed in his earlier years the bitter struggle between the popedom and Spain; and it had become the cherished design of his life to render the States powerful and independent, and himself, as pontiff, the representative of a formidable political confederation. To this end he deemed it essential to prevent the duchy of Mantua from falling into the hands of a ruler who represented an influence antagonistic to, or independent of, Spain; and in pursuit of this policy he sought the aid of Richelieu. It was the time when the great cardinal was maturing his designs against the house of Hapsburg; and, somewhat singularly, the popedom was thus brought into political alliance with the statesman who was aiming at the overthrow of the very power to which Roman Catholicism had been most indebted for its restoration. In the policy of Richelieu and that of Urban there was indeed a similar inconsistency. The former, while he persecuted the Huguenots at home, allied himself with Protestant powers like England, the United Provinces, and the northern German principalities; the latter, while he had recourse to the most rigorous measures for the suppression of Protestantism in Germany, allied himself with the power on which that Protestantism mainly relied for support. It is scarcely too much to affirm to say that Protestantism, in the first half of the 17th century, owed its very existence on the Continent to the political exigencies of the popedom. During Urban's pontificate, in the year 1634, the duchy of Urbino was incorporated, like Ferrara, into the papal dominions, which now extended from the Tiber to the Po, uninterrupted save by the little republic of San Marino.

Innocent
X.

The policy of INNOCENT X. (1644-55) was a complete reversal of that of his predecessor, whose family he persecuted with implacable animosity. So injurious indeed were the effects of the contentions produced by these family feuds on the peace and prosperity of the city that ALEXANDER VII. (1655-67) on his election took an oath before the crucifix that he would never receive his kindred in Rome. Not less serious were the dissensions produced by the strife of political parties. We find an English visitor to Rome, during Innocent's pontificate, deeming it prudent to place himself under the protection of two cardinals—the one representing the French, the other the Spanish faction. In Innocent's eyes the treaty of Westphalia assumed the aspect of a twofold disaster: in the humiliation which it inflicted on the house of Hapsburg; and in the distinctness with which it proclaimed the superiority of the state over the church, by the declaration that all ordinances of the canon or civil law which might be found to be at variance with the provisions of the treaty should be considered null and void. Innocent even went so far as to denounce the treaty and to threaten those who assented to its provisions with excommunication—a menace treated with contemptuous indifference even by the Catholic powers. Throughout the reign of Louis XIV., indeed, there existed a perfect understanding between that monarch and the Jesuits; and with their support he could set the pope himself at defiance with impunity. Louis asserted more unreservedly than any of his predecessors the royal privileges known

as the *droit de regale*. By this ancient right the crown claimed, whenever a bishopric was vacant, both the revenues and the distribution of patronage attached to the see as long as the vacancy continued. But in the southern provinces of Guienne, Languedoc, Provence, and Dauphiné this right had hitherto never been enforced. In an edict issued in 1673, however, Louis declared that the *droit de regale* would in future be enforced throughout the whole extent of the royal dominions. It was in vain that Innocent protested and threatened to excommunicate those who espoused the royal claims. Louis, who was supported by the great mass of the French clergy, remained firm; and nine years later a further blow was aimed at papal predominance by the promulgation of the famous *Declaratio Cleri Gallicani*. In this notable manifesto, which was drawn up at St Germain's in 1682 and revised by Bossuet, a formal denial was given to the theory that the pope had any power over the temporalities of kings; the superiority of a general council over the pope was once again affirmed; the administration of the affairs of the church by the pontiff, it was declared, ought in all cases to be subject to the canon law, and the papal authority to be exercised exclusively in connexion with questions of dogma, but even in such matters the decisions of the pontiff were not infallible and were subject to revision. INNOCENT XI. (1676-89), who had in the meantime succeeded to the papal chair, declared these resolutions to be null and void, and severely censured the French bishops who had assented to them. His reputation for integrity and a genuine desire to reform the church gave additional force to his protest. Among other measures for restoring order in Rome he had deprived the French ambassador of the much-abused right of asylum which, by long tradition, attached to the embassy and its extensive precincts, and afforded shelter to many of the most desperate characters in the city. The ambassador refused to yield up the privilege, and Innocent thereupon excommunicated him. Louis now seized upon Avignon, took the papal nuncio prisoner, and convened a general council. It was even believed that he had at one time conceived the design of creating the archbishop of Paris, who seconded and approved his policy, patriarch of France, and thus severing the last ties that bound the Gallican Church to the popedom. The courage and resolution which Innocent exhibited under these trying circumstances were by no means inspired solely by the conviction of the justice of his cause. Perhaps at no period are the interests and sympathies of religious parties to be found presenting a more complicated study. All Europe at this time was watching with alarm the rapid aggrandizement of the French monarchy; and Innocent, in his desire to see some check placed on that aggrandizement, was even far from wishing that the Huguenots should be expelled from France. With William of Orange he openly avowed his sympathy, and it was from secret papers in the cabinet of his minister of state that Louis, through the agency of a spy, first learned the prince's designs upon England. While the Jesuits, again, were co-operating with Louis in his assertion of the Gallican liberties, the Protestant powers were giving indirect support to the maintenance of the papal pretensions. From the Jesuits Louis also received valuable aid in the question of the Spanish succession; and it is to their machinations that contemporary writers ascribe the fact that the Bourbon, Philip of Anjou, was named by Charles II. as the heir to the Spanish monarchy.

The virtues and milder wisdom of INNOCENT XII. (1691-1700) won from Louis what the unconciliatory attitude of his two predecessors, Innocent XI. and ALEXANDER VIII. (1689-91) had not been able to obtain. In 1693 Louis himself notified to the pontiff that the "Declaration" would

XIV.

no longer be imposed as obligatory on the Gallican clergy. Innocent responded by giving his assent to the above-mentioned disposition of the Spanish crown by Charles II. Other circumstances concurred to bridge over the breach which for half a century had separated the French monarchy from the popedom. The revocation of the edict of Nantes (1685) had conciliated both the curia and the Jesuits; and in 1699 the feeling of accord between the French monarch and Innocent was confirmed by the condemnation of Fénelon's *Maximes des Saints*. While Protestantism was being crushed in France, Catholicism was obtaining in other countries the immunities which it would not grant. In 1697 the elector Frederick Augustus II. consented to declare himself a Catholic in order to gain the crown of Poland, and by this means a certain toleration was secured for Roman doctrine among a population bigotedly attached to Lutheranism. In 1713 the celebrated constitution *Unigenitus Dei Filii* promulgated by CLEMENT XI. (1700-21) not only proved a death-blow to Jansenism, but involved in nearly the same fate that party which had hitherto fought the battle of liberalism in the Gallican Church. "All the extravagancies," says a recent writer, "engendered by Jansenism in its later and more questionable developments recoiled, however unjustly, upon the system of ecclesiastical policy vindicated by Gerson, De Marca, and Bossuet. Jansenism became manifestly dangerous to public order and the security of the state; Gallicanism, in the view of a despotic Government, seemed involved in the same odious category; and it was deemed necessary, in consequence, to visit both with an impartial exhibition of the same persecuting rigour" (Jervis, *Church of France*, ii. 278). Many of the Jansenists, driven from France, retired to Utrecht, a church which, without professing Jansenist principles, long continued to uphold the standard of doctrine fixed by Tridentine canons in opposition to the dangerous advance of Jesuitism. The Jansenists were always distinguished by their resolute opposition to the theory of papal infallibility, and with their fall a chief obstacle to the promulgation of that dogma was removed.

But, while, with respect to the acceptance of doctrine, the losses of the 16th century were thus materially retrieved, the popedom was sinking rapidly in political importance. Its influence in the Italian peninsula dwindled to within the limits of the States of the Church; and the dynastic succession in Naples and Sicily, in Parma and Piacenza, underwent a total change without the curia or the pontifical interests being in any way consulted. The results of the War of the Spanish Succession disappointed in every way the hopes of Clement XI.; and his chagrin, when he found himself compelled to recognize the pretensions of the archduke Charles to the Spanish crown, was intense. The manner in which the conclusion of the war demonstrated the growing power of England was again a sinister omen for the permanence of the papal system.

The order to whose efforts, notwithstanding an exceptional experience in France, the popedom had in other countries been largely indebted was also destined to a signal reverse. The conviction had long been growing up in the chief cities of the Continent that wherever the representatives of Jesuitism obtained a footing the cause of public order and domestic peace was placed in jeopardy. And, while, in distant lands, the vaunted successes of the Jesuit missionaries too often represented the diffusion of a merely nominal Christianity, their activity as traders was a constant source of irritation to the mercantile communities. We find, accordingly, the statesmen of Catholic Europe exhibiting, in the middle of the 18th century, a remarkable unanimity in their estimate of Jesuitism as a mischievous element in society, and also showing an increasing determination to bring all ecclesiastical institu-

tions more and more under the control of the civil power. Carvalho, the Portuguese minister, who had himself become involved in a deadly struggle with the order at court, called upon BENEDICT XIV. (1740-58) to take measures for enforcing fundamental reforms among the whole body. Benedict, who recognized perhaps more fully than any other pontiff of the century the signs of the times, and who introduced not a few salutary reforms in the general relations of the curia, was far from disinclined for the task, but died before his schemes could be put in operation. His successor, CLEMENT XIII. (1758-69), on the other hand, professed to discern in the Jesuit body the surest stay of the church, and in 1765 gave his formal sanction to the peculiar form of devotion which they had introduced, known as the worship of the Sacred Heart. In 1768 he condemned their expulsion from France as "a grievous injury inflicted at once upon the church and the holy see." The dissensions fomented by their agency at the Bourbon courts continued, however, to increase; and in 1769 the representatives of the chief Catholic powers at the Roman court received instructions to present each a formal demand that the Jesuit order should be secularized and abolished. Clement, who had vainly appealed to the empress Maria Theresa for the exertion of her influence, died suddenly of apoplexy on the day preceding that on which a consistory was to have been held for the purpose of giving effect to the demands of the powers. It was expressly with the view that he should carry out the task which his predecessor had sought to evade that Cardinal Ganganelli, CLEMENT XIV. (1769-74), was raised to the pontifical chair, chiefly through the Bourbon interest. Originally a Franciscan friar, and a man of retiring unworldly disposition, the new pontiff was painfully embarrassed by the responsibilities attaching to the policy which he was expected to carry out. At length, after four years spent in balancing conflicting evidence and overcoming the scruples of his own mind, he issued the brief *Dominus et Redemptor Noster*, for the suppression of the order, which he declared to have merited its ruin by "its restlessness of spirit and audacity of action." The remorse which he was said to have subsequently exhibited, combined with his sudden and mysterious end, were not without considerable effect upon his successor, PRUS VI. (1775-99), who observed the utmost caution in carrying out the decree of Clement, and devoted his main efforts during his long pontificate to diverting the mind of Christendom from questions of doctrine to others of a practical and more pleasing character. The austere simplicity which had distinguished the Roman court in the time of Clement was exchanged for more than regal pomp and magnificence, while the pontiff's own subjects were benefited by the draining of the Pontine marshes, a work of immense labour, whereby a vast district extending along the sea-coast south of Rome was converted from an unhealthy swamp into a plain that subserved in some measure the purposes both of agriculture and commerce. That the suppression of the Jesuit order had been attended with no little danger to the interests of the Roman see was clearly shown by the progress which liberal opinions now began to make in Germany. The valuable researches of Muratori, which appeared in the earlier half of the 18th century had thrown a flood of light on all the circumstances of the development of the mediæval papacy, and his labours as an editor had served, at the same time, to render the successive contemporary writers accessible for the first time to the ordinary scholar. In the year 1763 the famous treatise of Nicholas von Hontheim, suffragan bishop of Treves, published under the pseudonym of "Febronius," produced a profound impression. It was entitled *On the State of the Church and the Legitimate Power of the Roman Bishop*,

and was mainly devoted to pointing out how largely the false decretals, and the application of their doctrines, had been made to subserve the later pretensions of Rome, and more especially her claims to assert the supremacy of the pontiff over general councils. On the accession of Joseph II., in 1780, to the throne of Austria, a new era commenced throughout the empire. Half the monasteries and friaries were suppressed. The bulls *Unigenitus* and *In Cena Domini* were declared null and void within the limits of the empire. Toleration was extended to Protestant sects and to members of the Greek Church; and the introduction of papal dispensations within the Austrian dominions was declared unlawful, unless it could be shown that they were obtained without payment. Pius VI. vainly endeavoured to divert the emperor from his policy of reform by a personal visit to Vienna in 1782. He was received with enthusiasm by the populace, but with coldness by the emperor, and by prince Kaunitz, the emperor's chief adviser, with absolute rudeness. A few years later the outbreak of the French Revolution seemed to portend for the popedom a like fate to that which had overtaken the Jesuit order. A movement which abolished tithes, rejected Catholicism as the state religion, and confiscated the property of the church and the monastic orders in France was not likely, when its representatives appeared in Italy, to deal leniently with papal institutions. The demeanour of the National Assembly towards Pius himself had not been disrespectful; but the outrages on religious sentiment and decency itself perpetrated by the Convention drove the alarmed pontiff into the arms of Austria, with whom and the several reigning Italian princes he hastily concluded an offensive league. In the Italian campaign he met accordingly with no mercy at the hands of the Directory, and of Bonaparte acting as their representative. In 1797, first of all at Bologna and subsequently at Tolentino, the most rigorous conditions were imposed. The pontiff was compelled to cede to France not only Avignon and the Venaissin, but also the legations of Bologna, Ferrara, and the Romagna—an extent of territory representing fully a third of the papal dominions; while at the same time a heavy pecuniary contribution was levied. Shortly after the peace of Tolentino (February 1797) Pius was seized with an illness which seemed likely, at his advanced time of life, to prove fatal; and Napoleon, in anticipation of his death, gave instructions that no successor to the office should be elected, and that the papal government should be abolished. The sequel, however, having disappointed these expectations, the French ambassador in Rome proceeded through his agents to foment an insurrection—a design for which the demoralized condition of the capital afforded unusual facilities. The outbreak that ensued was immediately made the pretext for abolishing the existing rule, and in its place the Roman republic was proclaimed (15th February 1798). Neither his estimable character nor his advanced years served to shield the dethroned pontiff from wanton cruelty and indignities. He was treated as virtually a prisoner, his private property confiscated, and at last, after having been removed from one place of confinement to another, he expired at Valence, in August 1799, at the age of eighty-two.

It was under the protection of a schismatic power,—that of the emperor of Russia,—that, after a lapse of eight months, Pius VII. (1800–23) was elected pope at Venice. To ordinary observers the condition of the papacy at this time seemed almost hopeless; and the skill with which those who guided its policy converted the very theories and events of the Revolution itself into a ladder whereby to regain the ancient vantage-ground is in its way not less remarkable than that contemporary career of military genius

which was before long destined to so sudden an eclipse. Latin Christendom, observes Bunsen, seems throughout its history to have been ever vacillating between two extremes—that of the grossest superstition and that of the profoundest scepticism, of bigotry and of atheism. It can scarcely, indeed, be doubted that the tolerance and indifference, the results of contempt with respect to all religious questions, which followed upon the Revolution largely favoured the reintroduction of Roman doctrine. By the curia itself the experiences of the past were interpreted in a manner eminently favourable to its own pretensions; the altar, it was asserted, was ever the surest support of the throne, and the spiritual authority claimed by the supreme pontiff afforded the best security for the maintenance of really free institutions. Pius VII., who as Cardinal Chiaramonte had at one time affected to approve of democratic principles, succeeded in gaining the good will of Bonaparte, and his accession was shortly followed by the concordat of 1801. The First Consul had already astonished the world by the startling change of opinion to which he gave expression in the Declaration of Milan, to the effect that “society without religion is like a ship without a compass”; and, having now resolved on the restoration of a monarchical form of government, he effected an apparent reconciliation with the Roman pontiff in order to strengthen his own hands. Catholicism was re-established as the state religion of France; but the confiscated property of the church was not restored, while the pretended reintroduction of the papal authority was deprived of all real validity by appending to the concordat certain “articles organiques” which effectually debarred the pontiff from the exercise of any real jurisdiction within the realm. In the concordat made with the Italian republic in 1803 the canon law was revived as the code whereby all questions not provided for in new articles were to be decided. Notwithstanding that he warmly resented the manner in which he had been duped, Pius was ultimately prevailed upon by the consummate address of Talleyrand to crown Napoleon as emperor in Paris. The immediate result of this imprudent act, as regarded the popedom, was the assertion of imperial rights in Rome itself on the part of the new emperor, and a demand that the pontiff should henceforth make common cause with him against the enemies of France. On his refusal Pius was made a prisoner, and the temporal sovereignty of the Roman see declared to be at an end. At Fontainebleau, in 1813, a new concordat was wrung from the infirm and aged pontiff (whose position and treatment strongly recalled those of his predecessor), and he was compelled to surrender almost the last remnants of his authority in France and to disown all claim to rank as a temporal ruler. Pius VII. survived, however, not only to witness the overthrow of his oppressor, but to regain with the Restoration both his spiritual and temporal prerogatives; and it was a notable feature in the proceedings that his resumption of the traditional pontifical rights in connexion with the legations was effected, in opposition to the wishes of Austria, with the support of England. He regained his chair, indeed, amid the best wishes of the Protestant powers,—a sympathy which, had he chosen to throw his influence into the scale that favoured advancement and reform, he might have retained unimpaired to the close of his pontificate. His policy, however, was thenceforth altogether reactionary. On the one hand he suppressed the circulation of the Scriptures in the vernacular; on the other, by a bull of 7th August 1814, he recalled the Jesuits, who since their dispersion in Latin Christendom had transferred the scene of their labours to Prussia and Russia. In other respects Pius's administration of his office was exemplary, and the same may be said of that of his successors, Leo XII. (1823–29), Pius VIII.

VIII. (1829-30), and GREGORY XVI. (1831-46). The adversities arising out of the Revolution had proved a salutary discipline. Nepotism ceased to disgrace the papal court. Ecclesiasticism itself assumed another tone: its morality was pure; its zeal in the performance of its duties conspicuous. In France there arose a new school, known as the *Parti Prêtre*, the school of Chateaubriand, Lamennais, and Montalembert, which rejected the ancient Gallican claims and principles, and everywhere inculcated loyalty and submission to Rome as the first duty of the Catholic. In Germany neither the enlightened and strenuous efforts of Wessenberg nor the statesmanlike policy of Metternich could produce concerted action among the several states, which were accordingly eventually reduced to the necessity of each making separate terms with the curia on an independent basis. The result, in nearly all cases, was that, in reconstructing its ecclesiastical organization, and endeavouring at the same time to establish a certain *modus vivendi* in its diplomatic relations with

Rome, each state was compelled to make concessions which largely favoured the re-establishment of ultramontane institutions. The signal failure of Wessenberg, in his administration of the see of Constance, to reintroduce the principles advocated by "Febronius," may be cited as one of the most notable instances of the defeat of liberal principles. In the Netherlands and in Silesia similar reactionary movements took place. In England, the Catholic Emancipation Act (1829), although conceived in a spirit of conciliation, proved, in the embittered relations then existing with Ireland, of little avail, and in reality only imparted fresh strength to the machinations of the ultramontane party. The main facts in the history of the popedom from this period will be found under the head of Prus IX. (1846-77), pp. 156-8, *supra*.

The following list taken from Gams (*Series Episcoporum Romanæ Ecclesiæ*) gives the succession of the pontiffs as accepted by the Roman Church and recorded in its registers.

Authorities.—The great series known as the *Annales Ecclesiastici* of Baronius, continued by Raynaldus, 42 vols. fol. (1738-56), represents a laborious but uncritical collection of materials from the earliest times down to the Reformation. The continuation by A. Theiner, embracing the period 1572-85, is of higher value. In a critical investigation of the original sources, the great work of F. Maassen, *Geschichte der Quellen und der Literatur des canonischen Rechts in Abendlände* (1871 sq.) is indispensable. Milman's *History of Latin Christianity* continues to be the fullest and most impartial source of information in English from the 1st to the 15th century; this may be supplemented by Gregorovius, *Geschichte der Stadt Rom im Mittelalter vom 5ten bis 16ten Jahrhundert*, 8 vols. (1859-72), which throws considerable light on the political and social relations of the city and the papal States; and also by Thomas Greenwood, *Cathedra Petri, a political History of the great Latin Patriarchate*, 6 vols. (1856-65). This latter work, although published subsequently to the first edition of Milman, was written before it, and, according to the author, without reference to its pages; it deserves the praise of being, at least in the earlier volumes, a piece of learned and laborious research on the part of a layman of considerable acquirements and candid disposition. In a comparison of the views and treatment of the two foregoing works, Wm. von Giesebrecht's *Geschichte der deutschen Kaiserzeit*, 5 vols. (5th ed. now publishing), will be found useful. *A History of the Papacy during the Period of the Reformation*, by Canon Creighton (only partly published), promises to furnish a valuable account of this period, derived from the original sources. From the Reformation, Leopold von Ranke, *Die römischen Päpste in den letzten vier Jahrhunderten*, 3 vols. (7th ed., 1878), is the classic work. A translation of the first edition into English by Sarah Austin appeared in 1840, and has been frequently reprinted. H. Geffcken, *Church and State*, translated by E. F. Taylor, 2 vols. (1877), supplies additional illustration, more especially of the relations in Germany. Nippold, *Handbuch der neuesten Kirchengeschichte*, 2 vols. (1880-83), traces the subject from the Reformation to the present time. The difficulties attaching to the first commencement, the earlier chronology, and the episcopal succession are elaborately treated by R. A. Lipsius, *Die Quellen der römischen Petrusage* (1872), and *Chronologie der römischen Bischöfe bis zur Mitte des vierten Jahrhunderts* (1869). For

the abstract treatment of the subject, Thomassin, *Vetus et nova Ecclesiae Disciplina* (1773), supplies the views of the moderate adherent of the Gallican Church as opposed to the ultramontanists; while the classic though somewhat antiquated discussion by Bingham in his *Antiquities of the Christian Church* (1st ed., 1708-22) gives the corresponding view of the moderate Anglican. The treatise of R. Baxmann, *Die Politik der Päpste, von Gregor I. bis auf Gregor VII.*, 2 vols. (1868-69), is of considerable merit. The *Regesta Pontificum Romanorum*, edited by Jaffe and Potthast, 3 vols., gives a kind of *catalogue raisonné* of the pontifical briefs, letters, and encyclicals from 67 to 1304 A.D. Of the letters themselves no complete collection has appeared; the volume edited by Coustant (1796) comes down only to 437, the more recent collection by Thiel embraces only the period 461-523. The Bulls of Innocent IV. and Benedict XI. have recently been edited from the original MSS. in the Vatican, the former by M. Élie Berger, the latter by M. Grandjean. For information on technical points involving the relations of the popedom to the canon law and the church at large, see J. F. von Schultz, *Lehrbuch des katholischen Kirchenrechts*, 2 vols. (1856-60). The manual by F. Walter, *Lehrbuch des Kirchenrechts aller christlichen Confessionen* (14th ed., 1871), of which the first edition appeared in 1822, illustrates the departure from the older ecclesiastical code which took its rise in the anti-Febronian movement. The abuses that arose out of the papal nepotism are depicted by Gregorio Leti (a convert from Romanism in the 17th century) in a well-known volume,—"Il Nipotismo di Roma, or the History of the Pope's Nephews from the time of Sixtus IV. to the death of Alexander VII.", in two parts: written originally in Italian and English by W. A., London, 1669." The tombs of the pontiffs and the associations they recall are admirably described by Gregorovius in a little volume entitled *Die Grabdenkmäler der Päpste* (2d ed., 1881). (J. B. M.)

POPLAR (*Populus*), the name of a small group of arborescent amentaceous plants, belonging to the order *Salicaceae*. The catkins of the poplars differ from those of the nearly allied willows in the presence of a rudimentary perianth, of obliquely cup-shaped form, within the toothed

bracteal scales; the male flowers contain from eight to thirty stamens; the fertile bear a one-celled (nearly divided) ovary, surmounted by the deeply cleft stigmas; the two-valved capsule contains several seeds, each furnished with a long tuft of silky or cotton-like hairs. The leaves are broader than in most willows, and are generally either deltoid or ovate in shape, often cordate at the base, and frequently with slender petioles vertically flattened. Many of the species attain a large size, and all are of very rapid growth. The poplars are almost entirely confined to the north temperate zone, but a few approach or even pass its northern limit, and they are widely distributed within that area; they show, like the willows, a partiality for moist ground, and often line the river-sides in otherwise treeless districts. The number of species cannot be very accurately defined,—several, usually regarded as distinct, being probably merely variable forms of the same type. All yield a soft easily-worked timber, which, though very perishable when exposed to weather, possesses sufficient durability when kept dry to give the trees a certain economic value.

Of the European kinds, one of the most important and best marked forms is the White Poplar or Abele, *P. alba*, a tree of large size, with rounded spreading head and curved branches, which, like the trunk, are covered with a greyish-white bark, becoming much furrowed on old stems. The leaves are ovate or nearly round in general outline, but with deeply waved, more or less lobed and indented margins and cordate base; the upper side is of a dark green tint, but the lower surface is clothed with a dense white down, which likewise covers the young shoots,—giving, with the bark, a hoary aspect to the whole tree. As in all poplars, the catkins expand in early spring, long before the leaves unfold; the ovaries bear four linear stigma lobes; the capsules ripen in May. A nearly related form, which may be regarded as a sub-species, *P. canescens*, the Grey Poplar of the nurseryman, is distinguished from the true abele by its smaller, less deeply cut leaves, which are grey on the upper side, but not so hoary beneath as those of *P. alba*; the pistil has eight stigma lobes. Both trees occasionally attain a height of 90 feet or more, but rarely continue to form sound timber beyond the first half-century of growth, though the trunk will sometimes endure for a hundred and fifty years. The wood is very white, and, from its soft and even grain, is employed by turners and toy-makers, while, being tough and little liable to split, it is also serviceable for the construction of packing cases, the lining of carts and waggons, and many similar purposes; when thoroughly seasoned it makes good flooring planks, but shrinks much in drying, weighing about 58 lb per cubic foot when green, but only 33½ lb when dry. The white poplar is an ornamental tree, from its graceful though somewhat irregular growth, and its dense hoary foliage; it has, however, the disadvantage of throwing up numerous suckers for some yards around the trunk.

The grey and white poplars are usually multiplied by long cuttings; the growth is so rapid in a moist loamy soil that, according to Loudon, cuttings 9 feet in length, planted beside a stream, formed in twelve years trunks 10 inches in diameter. Both these allied forms occur throughout central and southern Europe, but, though now abundant in England, it is doubtful whether they are there indigenous. *P. alba* suffers much from the ravages of wood-eating larvæ, and also from fungoid growths, especially where the branches have been removed by pruning or accident; trunks have occasionally acquired a diameter of 3 feet and upwards.

The aspens form an important section, of which the Common Aspen of Europe, *P. tremula*, may be taken as the type,—a tall fast-growing tree with rather slender trunk, and grey bark becoming rugged when old; the

orbicular leaves, toothed on the margin, and slightly downy when young, are afterwards smooth, dark-green on the upper and greyish-green on the lower surface; the long slender petioles, much flattened towards the outer end, allow of free lateral motion by the slightest breeze, giving the foliage its well-known tremulous character.

The aspen is an abundant tree in the northern parts of Britain, even as far as Sutherland, and is occasionally found in the coppices of the southern counties, but in these latter habitats seldom reaches any large size; throughout northern Europe it abounds in the forests,—in Lapland flourishing even in 70° N. lat., while in Siberia its range extends to the Arctic Circle; in Norway its upper limit is said to coincide with that of the pine; trees exist near the western coast having stems 15 feet in circumference. The wood of the aspen is very light and soft, though tough; it is employed by coopers, chiefly for pails and herring-casks; it is also made into butchers' trays, pack-saddles, and various articles for which its lightness recommends it; sabots are also made of it in France, and in mediæval days it was valued for arrows, especially for those used in target practice; the bark is used for tanning in northern countries; cattle and deer browse greedily on the young shoots and abundant suckers. Aspen wood makes but indifferent fuel, but charcoal prepared from it is light and friable, and has been employed in gunpowder manufacture. The powdered bark is sometimes given to horses as a vermifuge; it possesses likewise tonic and febrifugal properties, containing a considerable amount of salicin. The aspen is readily propagated either by cuttings or suckers, but has been but little planted of late years in Britain. *P. tremula*, or *tremuloides*, is closely allied to the European aspen, being chiefly distinguished by its more pointed leaves; it is a native of most parts of Canada and the United States, extending northwards as far as Great Slave Lake. The American Aspen is a smaller tree than *P. tremula*, seldom rising to a greater height than 30 feet, and rarely forming timber of any value; the wood burns better in the green state than that of most trees, and is often used by the hunters of the northwest as fuel; split into thin layers, it was formerly employed in the States for bonnet and hat making; the bark is of some value as a tonic and febrifuge. *P. grandidentata*, the Large-leaved American Aspen, is a tree of larger growth, with ovate or roundish leaves deeply and irregularly serrated on the margin. The wood is strong, and considered durable for indoor use; it is also employed in some districts for fences; split into slender strips, it has been applied to the manufacture of hats, like that of the Canadian aspen.

Some of the most valuable trees of the genus belong to a section remarkable for the elongation of the fertile catkins, which become lax towards maturity. *P. nigra*, the Black Poplar, one of the most important of this group, is a tree of large growth, with dark deeply-furrowed bark on the trunk, and ash-coloured branches; the smooth deltoid leaves, serrated regularly on the margin, are of the deep green tint which has given name to the tree; the petioles, slightly compressed, are only about half the length of the leaves. The black poplar is common in central and southern Europe and in some of the adjacent parts of Asia, but, though abundantly planted in Britain, is probably not there indigenous. The wood is of a yellowish tint. In former days this was the prevalent poplar in Britain, and the timber was employed for the purposes to which that of other species is applied, but has been superseded by *P. monilifera* and its varieties; it probably furnished the poplar-wood of the Romans, which, from its lightness and soft tough grain, was in esteem for shield-making; in continental Europe it is still in some request; the bark, in Russia, is used for tanning leather,

while in Kamchatka it is sometimes ground up and mixed with meal; the gum secreted by the buds was employed by the old herbalists for various medicinal purposes, but is probably nearly inert; the cotton-like down of the seed has been converted into a kind of vegetable felt, and has also been used in paper-making. A closely related form is the well-known Lombardy Poplar, *P. fastigiata*, remarkable for its tall cypress-like shape, caused by the nearly vertical growth of the branches. Probably a mere variety of the black poplar, its native land appears to have been Persia or some neighbouring country; it was unknown in Italy in the days of Pliny, while from remote times it has been an inhabitant of Kashmir, the Punjab, and Persia, where it is often planted along roadsides for the purpose of shade; it was probably brought from these countries to southern Europe, and derives its popular name from its abundance along the banks of the Po and other rivers of Lombardy, where it is said now to spring up naturally from seed, like the indigenous black poplar. It was introduced into France in 1749, and appears to have been grown in Germany and Britain soon after the middle of the last century, if not earlier. The Lombardy poplar is valuable chiefly as an ornamental tree, its timber being of very inferior quality; its tall erect growth renders it useful to the landscape-gardener as a relief to the rounded forms of other trees, or in contrast to the horizontal lines of the lake or river-bank where it delights to grow. In Lombardy and France tall hedges are sometimes formed of this poplar for shelter or shade, while in the suburban parks of Britain it is serviceable as a screen for hiding buildings or other unsightly objects from view; its growth is extremely rapid, and it often attains a height of 100 feet and upwards, while from 70 to 80 feet is an ordinary size in favourable situations.

P. canadensis, the "Cotton-wood" of the western prairies, and its varieties are perhaps the most useful trees of the genus, often forming almost the only arborescent vegetation on the great American plains. The *P. canadensis* of Michaux, which may be regarded as the type of this group, is a tree of rather large growth, with rugged grey trunk, and with the shoots or young branches more or less angular; the glossy deltoid leaves are sharply pointed, somewhat cordate at the base, and with flattened petioles; the fertile catkins ripen about the middle of June, when their opening capsules discharge the cottony seeds which have given the tree its common western name; in New England it is sometimes called the "River Poplar." The cotton-wood timber, though soft and perishable, is of value in its prairie habitats, where it is frequently the only available wood either for carpentry or fuel; it has been planted to a considerable extent in some parts of Europe, but in England a kindred form, *P. monilifera*, is generally preferred from its larger and more rapid growth. In this well-known variety the young shoots are but slightly angled, and the branches in the second year become round; the deltoid short-pointed leaves are usually straight or even rounded at the base, but sometimes are slightly cordate; the capsules ripen in Britain about the middle of May. This tree is of extremely rapid growth, and has been known to attain a height of 70 feet in sixteen years; the trunk occasionally acquires a diameter of from 3 to 5 feet, and, according to Emerson, a tree near New Ashford, Massachusetts, measured 20 feet 5 inches in circumference; it succeeds best in deep loamy soil, but will flourish in nearly any moist but well-drained situation. The timber is much used in some rural districts for flooring, and is durable for indoor purposes when protected from dry-rot; it has, like most poplar woods, the property of resisting fire better than other timber. The native country of this sub-species has been much disputed; but, though still known in many British nurseries as the "Black Italian Poplar," it is now well ascertained to be an indigenous tree in many parts of Canada and the States, and is probably a mere variety of *P. canadensis*; it seems to have been first brought to England from Canada in 1772. In America it seldom attains the large size it often acquires in England, and it is there of less rapid growth than the prevailing form of the western plains; the name of "cotton-wood" is locally given to other species. *P. macrophylla* or *candicans*, commonly known as the Ontario Poplar, is remarkable for its very large heart-shaped leaves, sometimes 10 inches long; it is found in New England and the milder parts of Canada, and is frequently planted in Britain; its growth is extremely rapid in moist land; the buds are covered with a balsamic secretion. The

true Balsam Poplar, or Tacamahac, *P. balsamifera*, abundant in most parts of Canada and the northern States, is a tree of rather large growth, often of somewhat fastigiate habit, with round shoots and oblong-ovate sharp-pointed leaves, the base never cordate, the petioles round, and the disk deep glossy green above but somewhat downy below. This tree, the "liard" of the Canadian voyageur, abounds on many of the river sides of the north-western plains; it occurs in the neighbourhood of the Great Slave Lake and along the Mackenzie river, and forms much of the drift-wood of the Arctic coast. In these northern habitats it attains a large size; the wood is very soft; the buds yield a gum-like balsam, from which the common name is derived; considered valuable as an antiscorbutic, this is said also to have diuretic properties; it was formerly imported into Europe in small quantities, under the name of "baume focot," being scraped off in the spring and put into shells. This balsam gives the tree a fragrant odour when the leaves are unfolding. The tree grows well in Britain, and acquires occasionally a considerable size. A very closely allied variety abounds in Siberia and Dauria, chiefly distinguished by its wider leaves, rounded growth, and the darker tint of its wood; a kind of wine, esteemed as a diuretic, is prepared in Siberia from the buds. Its fragrant shoots and the fine yellow green of the young leaves recommend it to the ornamental planter. It is said by Aiton to have been introduced into Britain about the end of the 17th century. (C. P. J.)

POPLIN, or TABINET, is a mixed textile fabric consisting of a silk warp with a weft of worsted yarn. As the weft is in the form of a stout cord, the fabric has a ridged structure, like rep, which gives depth and softness to the lustre of the silky surface. Poplins are used for dress purposes, and for rich upholstery work. The manufacture is of French origin; but it was brought to England by the Huguenots, and has long been specially associated with Ireland. The French manufacturers distinguish between *popelines unies* or plain poplins and *popelines à dispositions* or *Ecossaises*, equivalent to Scotch tartans, in both of which a large trade is done with the United States from Lyons.

POPOCATEPETL (Aztec *popocani*, "smoking," *tepetl*, "mountain"), a burning mountain in Mexico, in 18° 59' 47" N. lat. and 98° 33' 1" W. long., which along with the neighbouring and somewhat lower summit of Ixtaccihuatl (Aztec "White Woman") forms the south-eastern limit of the great valley in which the capital is built. As it lies in the province of Puebla, and is the great feature in the view from that city, it is also called the Puebla Volcano. With the single exception of Mount Elias in Alaska, Popocatepetl appears to be the highest peak in North America, rising as it does in a regular snow-covered cone to an altitude of 17,853 feet. The main mass of the mountain consists of andesite, but porphyry, obsidian, trachyte, basalt, and other similar rocks are also represented. Between the pine forest (*Pinus occidentalis*), which ceases at a height of 12,544 feet, and the snow limit, 14,960 feet, there lies a tract of loose sand, largely composed of grains of sulphur, which renders the ascent tedious and at times dangerous, though the first 1600 feet can be accomplished on horseback. On the summit is an enormous crater measuring 5000 feet across and with a sheer depth of 2000 feet. The vapours rising from the solfataras, the mixture of sulphur yellow and ash grey in the caldron, the dazzling snow on the edges of the crater walls, and the deep blue of the sky above produce the most indescribable effects of colour. The highest point of the mountain is a softly rounded eminence about 30 feet only from the rim. Sulphur from the crater is regularly worked by a number of Indians who have their huts at the foot of the cone, at a height of 12,000 feet. The material is shot down a slide for a distance of between 2000 and 3000 feet, and the workmen also avail themselves of this means of descent. At the foot of the east slope of Popocatepetl stretches a vast lava field—the Malpays of Atlachayacatl, which gives birth to the Rio Atlaco. According to Humboldt, it rises from 60 to 80 feet above the plain, and extends 18,000 feet from east to west with a breadth of 6000 feet. The date of its formation

must be of great antiquity. There have been only two or three moderate eruptions during the last 300 years, though smoke continually issues from the crater, and from time to time vast showers of cinders and stones are shot up.

In 1519 Cortes sent a party of ten men to climb a smoking mountain which was evidently Popocatepetl; and in 1522 Francisco Montañó not only reached the summit but had himself let down into the crater a depth of 400 or 500 feet. No second ascent of the mountain is recorded till April (see Brantz Mayer, *Mexico*, vol. ii.) and November 1827. Other ascents have been made in 1834, 1848, and subsequent years.

POPPÆA SABINA. See NERO.

POPPY OIL is obtained by pressure from the minute seeds of the garden or opium poppy, *Papaver somniferum* (see OPIUM, vol. xvii. p. 787). The white-seeded and black-seeded varieties are both used for oil-pressing; but, when the production of oil is the principal object of the culture, the black seed is usually preferred. The qualities of the oil yielded by both varieties and the proportion they contain (from 50 to 60 per cent.) are the same. By cold pressure seeds of fine quality yield from 30 to 40 per cent. of virgin or white oil (*huile blanche*), a transparent limpid fluid with a slight yellowish tinge, bland and pleasant to taste, and with almost no perceptible smell. On second pressure with the aid of heat an additional 20 to 25 per cent. of inferior oil (*huile de fabrique* or *huile russe*) is obtained, reddish in colour, possessed of a biting taste, and a linseed-like smell. The oil belongs to the linoleic or drying series, having as its principal constituent linolein; and it possesses greater drying power than raw linseed oil. Its specific gravity at 15° C. is 0.925; it remains limpid at -15° C., but forms a thick white mass at -20° C., which does not again become fluid till the temperature rises to -2° C. Poppy oil is a valuable and much used medium for artistic oil painting. The fine qualities are largely used in the north of France (*huile de ceillette*) and in Germany as a salad oil, and are less liable than olive oil to rancidity. The absence of taste and characteristic smell in poppy oil also leads to its being much used for adulterating olive oil. The inferior qualities are principally consumed in soap-making and varnish-making, and for burning in lamps. The oil is very extensively used in the valley of the Ganges and other opium regions for food and domestic purposes. By native methods in India about 30 per cent. of oil is extracted, and the remaining oleaginous cake is used as food by the poor. Ordinary poppy-oil cake is a valuable feeding material, rich in nitrogenous constituents, with an ash showing an unusually large proportion of phosphoric acid. The seed of the yellow horned poppy, *Glaucium luteum*, yields from 30 to 35 per cent. of an oil having the same drying and other properties as poppy oil; and from the Mexican poppy, *Argemone mexicana*, is obtained a non-drying purgative oil useful as a lubricant and for burning.

POPULATION. The phenomena of population are the product of physical forces the nature of which it will be necessary to investigate. It will, however, be convenient to consider population, in the first place, as a statical phenomenon, that is, to observe and classify the principal features it presents, without attempting to investigate the system of causes of which they are the effects. Thereafter the dynamical aspects of the subject, namely, the general laws governing the forces whose joint action has produced population, will receive attention.

I. Population, *statically* considered, may be defined as "the totality of human beings existing within a given area at a given moment of time." This definition is identical with that adopted by Haushofer (p. 87), except that that eminent authority thought it unnecessary to add the clause relating to time. The totality just mentioned is ascertained in modern times and by civilized nations by the statistical

operation known as the CENSUS (*q.v.*). It is usual to obtain by means of a census a good deal of information beyond the bare fact of the number of persons whose existence is, for the purposes of the census, taken cognizance of. Part of this information is obtained for purposes connected with the administration of the state, such as that contained in replies to questions as to the religion, profession, &c., of the individuals numbered. But these facts, though highly important, are not facts of population strictly speaking. There are two very important characteristics common to all considerable populations—namely, the approximate constancy of the distribution of the population as regards sex and age. A census which did not distinguish between the number of male and the number of female persons composing the population of which it takes cognizance would be seriously defective. Inquiries as to the height and the girth round the chest of individuals are usually made in countries where military service is compulsory, and the degree of prevalence of bodily defects, such as blindness and deafness, is also noted for similar reasons; but such inquiries are the work of specialists, official and other, and in any case are not included in the information obtained from a census. The age of each individual is, however, easily obtained in the course of the operations of the census. We shall now briefly set forth the general characteristics of a population, examined at a particular point of time and without reference to similar phenomena at previous points of time.

Population of the World.—The total population of the world is, to a large extent, an estimate, inasmuch as in some countries a proper census has never been taken, while in many the interval that has elapsed since the last operation is so long as to reduce it to the level of serving as a basis for a calculation in which estimates play a large part.

So great, indeed, is the uncertainty in which all such calculations are involved that an eminent French statistician, M. Block, abandons all attempt to deal with the problem, dismissing the subject in the following note (*Traité*, &c., p. 401),—"Nous abstentions de donner le chiffre de l'ensemble de la population de la terre; personne ne connaît ce chiffre." With this view of the matter we entirely agree, without, however, any disparagement to the valuable work done by Behm and Wagner, who have made the population of the earth their special study, and are under no illusions as to the accuracy of the results they have to offer. The work of these two eminent men of science has at any rate drawn attention to the *lacunæ* in our present.

knowledge, besides arranging and co-ordinating the great multiplicity of well-ascertained facts at our disposal. As civilization advances the area of the unknown or partially known, which is at present large, will gradually diminish.

Table I (p. 513 *supra*), taken from Haushofer's work (*Lehr- u. Handbuch*, p. 90, note 1), will show how greatly the estimates of the world's population have varied since people first began to make them. We venture to say that any person of fair intelligence and ordinary education would, even without any statistical training, come to the conclusion that there was nothing certain to be known on the subject which these figures profess to illustrate. The fact that Behm and Wagner's latest estimate is less than that published by them two years previously shows how difficult the subject is. We should add that the reasons given by them for this discrepancy, for even a tyro would have expected a slight increase, are quite satisfactory, and add to our confidence in that part of the investigation for which they profess to give figures approximating to accuracy.

According to Behm and Wagner (*Die Bevölkerung der Erde*, vii.) the following (Table II.) may be taken as the population of the sections of the world indicated in June 1882:¹—

	Area in Square Kilometres.	Inhabitants.		
		Number.	Per Sq. Kilo.	Per Sq. Mile.
Europe.....	9,730,576	327,743,400	34·0	88·0
Asia.....	44,580,850	795,591,000	18·0	46·6
Africa.....	29,823,253	205,823,200	7·0	18·1
America.....	38,473,138	100,415,400	2·6	6·7
Australasia..	8,952,855	4,232,000	0·5	1·3
Polynesia....				
Polar regions	4,478,200	82,500
Total..	136,038,872	1,433,887,500	10·5	27·1

Sex.—The obstacles which make it difficult to attain even an approximate statement of the population of the world prevent us from obtaining any accurate knowledge whatever as to the sexual constitution of that population. We have, however, tolerably accurate information on this subject for most of the countries of Europe, for the United States, and for Canada. From the figures available it is evident that no general proposition can be laid down on the subject of the normal proportion of females to males, except that in so-called "old" countries there is usually a slight excess of the former.

TABLE V.—Statement of the "Age Scale" (*Altersaufbau*) of the Population in each of the undermentioned Countries; showing by Semi-Decennial Periods up to 30 Years, and Decennial Periods subsequently, the Number of Persons of each Age out of every Thousand Persons in the Population.

TABLE III.—Statement of the Number of Females living in the under-mentioned Countries for every Thousand Males in the Year mentioned (Haushofer, p. 216):—

	Year.	Females to each 1000 Males.
German Empire.....	1875	1,036
England and Wales.....	1871	1,054
Scotland.....	"	1,096
Ireland.....	"	1,044
Denmark.....	1870	1,026
Norway.....	1865	1,036
Sweden.....	1870	1,067
Austria.....	1869	1,041
Hungary.....	"	1,002
Italy.....	1870	989
Switzerland.....	"	1,046
France.....	1872	1,008
Belgium.....	1866	995
Holland.....	1869	1,029
United States.....	1870	972
Canada.....	"	939

The census of England and Wales for 1881 gave 1055 females to 1000 males. A slight tendency to an increase in the proportion is perceptible in some countries, and to a decrease in others, as the following table (IV.) given by Wappäus and quoted by Haushofer (p. 217) will show. The reader will observe that Wappäus's figures are the proportions to 100, not to 1000, as in Table III.

	Year.	Females to 100 Males.		Year.	Females to 100 Males.
England.....	1851	104·16	Sweden.....	1850	106·40
Scotland.....	"	110·02	France.....	1851	101·12
Ireland.....	"	103·37	Belgium.....	1846	100·47
Denmark.....	1850	103·30	Holland.....	1849	103·96
Norway.....	1855	104·14	United States..	1850	95·05

The 1880 census of the United States states the proportion of females to males at 96·54 per cent., which is rather smaller than that shown in 1870 (97·2 per cent.); but immigration is still a potent factor in the growth of the population of that country.

With regard to the causes of the excess of females, as in most other social phenomena, our knowledge is very small at present. The reason for the broad distinction between Europe and North America is pretty obvious. New countries are continually receiving many male and fewer female immigrants. Probably also, life being very rough in the more unsettled portions of such countries, the rate of mortality among females is a little higher than in

places where women can receive more protection from hardship. On the other hand, even in Europe men run many risks to which women are not exposed. The subject is a very interesting one, but cannot be adequately treated except at much greater length than is possible here, and we must refer our readers to special works for further information.

Age.—The characteristics of a population from the point of view of age, which German writers term “*Altersaufbau*,” can only be treated very generally. Table V. on p. 514 is quoted by Haushofer (p. 213) from Von Scheel’s *Handbuch der Statistik*.

This “age scale” shows us the proportion in which persons of various categories of age are found combined to form populations. The general characteristics of the groups are tolerably obvious. It must be remembered that after thirty years the periods are decennial. The difference between the age scale of Europe and that of North America is considerable. In the latter, owing mainly to the fact that emigrants are usually young, a much larger proportion of the population than in Europe are under thirty years of age. On the other hand the age scale of France presents a feature of an opposite kind, namely, a deficiency of persons under fifteen years of age, and an excess of those over forty, as compared with the average of Europe. This conformation of the age scale may be compared with that of Hungary, where the number of children is larger and the number of persons over forty less than the average. It is probable that the smaller number of children in the one case and the larger in the other directly lead respectively to a smaller infant mortality in France than in Hungary. As M. Block observes (*Traité*, p. 409), “*Nous avons moins d’enfants; mais, grâce à une moindre mortalité dans le jeune âge, nous avons plus d’adults.*” It is obvious that *ceteris paribus* it is easier to pay the requisite attention to the rearing of a small number of children than to do the same for a larger number.

Careful inquiries into age scales are of very recent origin, the data required for evaluating those relating to earlier periods being absent. Moreover, erroneous statements as to their age are made by a much larger number of persons than might be supposed, sometimes from carelessness or ignorance, but also intentionally. The tendency of women over twenty-five to understate their age, combined with overstatements of age by girls and young women under twenty, always tends to make the twenty to twenty-five section of the age scale unduly large (see *Census of England and Wales*, 1881, vol. iv., “General Report”). We must regard even the age scales now in existence as merely first approximations, for it is evident that observations obtained from several censuses must be reduced and combined before we can feel certain that accidental causes of error have been eliminated. This is all the more necessary as the age scale of any given population cannot be regarded as fixed, any more than the magnitude of the population itself, both being liable to modifications arising out of the varying dynamical conditions existing at different periods. And this brings us to the second portion of our inquiry, in which we shall indicate in the most general way the nature of the proximate causes which underlie the phenomena of population considered as a fact existing at a particular moment of time.

II. Population, *dynamically* considered, is the result of two pairs of opposing forces, whose combined action may, for convenience, be theoretically conceived of as balancing each other, but which never do so balance as a matter of fact. A comparison of two successive censuses invariably shows some “movement of population.” In nearly all civilized countries the movement shown is one of growth when the body of population examined is large. The population of a village or a small town may, quite con-

ceivably, show a reduction in number for the period between two censuses, but this can hardly be the case with a large town, and still less with a nation, unless as the consequence of some great calamity such as an earthquake or a pestilence or a change in the climatic or economic conditions of the country inhabited. A great war, of course, produces a certain retardation of the rate of increase. Although some of the uncivilized peoples of the world are rapidly disappearing, the tendency of the population of the whole world is evidently to increase—at what rate it is impossible to say, for reasons already mentioned; and our inquiry will, therefore, be confined to peoples regarding whose population we have comparatively accurate information for an adequate number of years.

The causes of the movement of population are internal and external. The internal arise out of the numerical relation between the births and deaths of a given period, there being an increase when there are more births than deaths, a decrease in the contrary case. Haushofer expresses this by a formula which is sometimes convenient:—“There is an increase where the intervals between successive births are smaller than those between successive deaths” (p. 115). The external are immigration and emigration. The intensity of these two forces operating on population depends on a variety of causes, into which we do not propose to enter. Generally speaking, it may be said that “new” countries, where the density of population is small, attract immigrants from countries in which the density of population is great. The density of population is expressed by the figure denoting the number of inhabitants per square mile (or square kilometre) of the territory they occupy. For a discussion of the various political, social, and economic causes which determine density of population, we must refer our readers to the works of Haushofer (p. 173) and Block (p. 456). Before analysing the components of the movement of population it will be useful to examine briefly that movement itself, and ascertain what is its normal rate in civilized countries. The mode of expressing this rate which is most commonly adopted in the exposition of statistics of population is to state the number of years in which a given population “doubles itself.” It is not a very scientific method of expressing the facts, since it assumes that the rate of a few years will continue for a period of many years, but, in deference to custom, we give a table constructed in accordance with it.

TABLE VI.—Statement of the Yearly Rate of Increase of the Population of the undermentioned Countries during the following Periods, with the Number of Years in which the said Populations would double themselves, on the supposition that the rates remain unchanged (Wappaus, quoted by Haushofer).

	Basis of Calculation.		Approximate Doubling Years.
	Years.	Annual Percentage of Increase.	
Norway	1845–55	1.15	61
Denmark	1845–55	0.89	71
Sweden	1850–55	0.88	79
Saxony	1852–55	0.84	83
Holland	1840–49	0.67	103
Sardinia	1838–48	0.58	119
Prussia	1852–55	0.53	131
Belgium	1846–56	0.44	158
Great Britain	1841–51	0.23	302
Austria	1842–50	0.18	385
France	1851–56	0.14	405
Hanover	1852–55	0.002	3,152

We now proceed to give a table (VII.) constructed by Signore Luigi Bodio on the best principles, which shows the annual rates of increase of a number of countries, for two distinct periods, taking account of the important changes

of frontier which have occurred during the whole period covered by the table. If this rectification had not been made it is obvious that the figures resulting from the observations of the two periods would not have been comparable in the case of Italy and several other states (Block, p. 405; Haushofer, p. 120). We may mention that the actually observed yearly rate of increase in the population of England and Wales between 1871 and 1881 was 1.44 per cent. of the population in 1871.

	Period Observed	Yearly Rate of Increase.	Period Observed.	Yearly Rate of Increase.
France.....	1800-60	0.48	1860-77	0.35
Italy.....	1800-61	0.61	1861-78	0.71

¹ Decrease.

It must be noted that, while the table may be relied on so far as Signior Bodio's treatment of the data goes, the data for the earlier part of the century are very defective, and the results deduced from them must be regarded as less trustworthy than those for the more recent of the two periods.

The above tables of increase of population include the effects of immigration and emigration, regarding which we have nothing further to say in this article, as the causes of these phenomena are too heterogeneous for general treatment. Moreover, except in comparatively unimportant cases—unimportant, that is, from our point of view, but by no means so from the standpoint of the statesman—the effects of these two causes are small, the main cause of the growth of population being the internal forces already mentioned, namely, the birth-rate and the death-rate.

During the earlier half of the century the rate of increase in the United States ranged from $2\frac{3}{4}$ to 3 per cent. per annum in the successive decades from census to census. The increase in the population of the United States has hitherto depended so much on immigration that at present inquiries into the normal birth and death rates of that country are very difficult, except in the eastern States. Of the total population, 50,442,066, as shown in the census of 1880, no less than 6,619,943, or over 13 per cent., were foreigners. The fact already mentioned, that the proportion of women to men is unusually low, serves to remind us that normal phenomena of population must not as yet be looked for in the American Union.

The Birth-Rate.—The birth-rate of a population is the proportion borne by the number of births in a year to the number of the population. It might seem that it is easy to obtain this rate, but as a matter of fact it is practically

impossible to do so. It is not difficult to ascertain, with sufficient accuracy, the number of births; the difficulty is to ascertain what is the number of the population, for that number is never the same for two days together. It is obvious that it would never do to evaluate the birth-rate of the United Kingdom, say for 1885, by means of the figures obtained in the census taken on April 4, 1881, and the error would be greater next year, and greater still the year after. The growth of the population since the last census must, therefore, be taken into account; but, even when it has been decided to adopt this plan, there is the difficulty of fixing on the date up to which the additions are to be made. The usual practice is to take the population of a date as near as possible to the middle of the year for which the birth-rate is required as the basis for the calculation. We mention these difficulties as a caution to students of statistics. The following table (VIII.) quoted by Haushofer, p. 123, is taken from Bodio's *Movimento dello Stato Civile* (Rome, 1880); the figures for the minor countries have been omitted, and still-births are excluded:—

	Period Observed.	Average Yearly Number of Births to 100 Inhabitants.

¹ Excluding Poland.

The birth-rate in different countries is influenced by various circumstances into which it is not possible to enter at length. The most important circumstance is the proportion borne by the number of women of child-bearing age to the whole population. There are other circumstances which must be kept in mind in comparing the birth-rates of different countries, such as the character of the age scale as a whole, and the density of population, besides climatic and other physical characteristics of the environment of the populations examined. The birth-rate is high in new countries, where there is always a larger proportion of young men than in old states, and where the proportion of women of child-bearing age is also large. The latter circumstance is, we may point out, quite consistent with the statement already made, that in new countries the proportion of women to men is smaller than in old ones. For an unusually large proportion of the total number of women in new countries are young.

Some facts relating to the absolute number of births may here be briefly referred to. The most important of these is its composition as regards sex. We have already seen that in most populations there are more women than men. This is not a consequence of there being more girls born than boys, for the fact is just the contrary. The following table (IX.) shows the number of male births to every 100 female births which took place in the under-mentioned countries during the periods stated (*Movimento, &c.*, p. 126; Haushofer, p. 218):—

Countries.	Period of Observation.	Boys born for 100 Girls.
Italy.....	1865-78	104
France.....	1866-77	103
England and Wales.....	1865-78	104
Scotland.....	1865-75	106
Ireland.....	1865-78	106
Prussia.....	1865-78	104
Bavaria.....	1865-78	103
Austria.....	1865-78	106
Hungary.....	1865-77	104
Switzerland.....	1872-78	99
Belgium.....	1865-78	102
Holland.....	1865-77	102
Sweden.....	1865-78	106
Spain.....	1865-70	104
Greece.....	1870-77	94
Roumania.....	1870-77	105
Russia in Europe.....	1867-74	105
Servia.....	1865-78	111

On the somewhat anomalous figures we must observe that those relating to Greece and Servia are possibly to be explained by the hypothesis of inaccurate returns. We may add that, if a distinction is made between legitimate and illegitimate children, it is usually found that the excess of male births is greater among the latter. In countries, therefore, where the proportion of illegitimate to legitimate births is high there will usually be a higher proportion of male to female births than in countries where there are not relatively so many illegitimate births (Block, p. 429).

Interesting inquiries have been made into the facts regarding the distribution of births during the year, showing that there are, as a rule, more births in some months than in others, and also as to the influence high prices for the primary necessities of life have on the number of births (Mayr, p. 235).

The Death-Rate.—The death-rate of a population is the proportion borne by the number of deaths in a year to the number of the population. The population is to be reckoned as has been already described in dealing with the birth-rate. This very important statistical quantity is sometimes confused with another relating to the same phenomenon,—namely, the mean duration of life. The difficulties in obtaining an accurate death-rate are, if anything, greater than in the case of the birth-rate.

TABLE X.—Statement of the Average Annual Death-rate in the undermentioned Countries, during the Years stated, excluding Still-births (Movimento, in Haushofer, p. 137).

Countries.	Period Observed.	Average Yearly Number of Deaths to 100 Inhabitants.
Italy.....	1865-78	2.99
France.....	1865-77	2.40
England and Wales.....	1865-78	2.20
Scotland.....	1865-78	2.21
Ireland.....	1865-78	1.72
Prussia.....	1865-78	2.72
Bavaria.....	1865-78	3.09
Austria.....	1865-78	3.18
Hungary.....	1865-77	3.80
Switzerland.....	1870-78	2.38
Belgium.....	1865-78	2.32
Holland.....	1865-77	2.49
Sweden.....	1865-78	1.92
Spain.....	1865-70	3.12
Greece.....	1865-77	2.09
Roumania.....	1870-77	2.65
Russia in Europe.....	1867-75	3.67

This table is sufficient for our purpose, which is to give a general idea as to the death-rate of these countries. Much more accurate approximations are, however, needed for actuarial purposes, and very elaborate valuations of the death-rate will be found in G. F. Knapp's work *Ueber die Ermittlung der Sterblichkeit* (Leipsic, 1868).

Great pains have been taken by most civilized states to obtain accurate figures as to the mortality of the population, and the literature dealing with the subject is of great extent.

We must now show how the death-rate is usually composed as regards age. The following table (XI.) shows the number of persons out of every hundred deaths who died at the undermentioned ages in each of the countries named (Haushofer, p. 143; quoted from the *Movimento*):—

	Italy, 1872-77.	France, 1866-77.	England, 1866-70.	Prussia, 1876-77.	Bavaria, 1871-77.	Austria, 1866-77.	Switzer- land, 1873-77.	Spain, 1865-70.	Russia in Europe, 1870-74.
0-1	26.73	18.79	24.76	32.20	40.47	31.80	26.21	22.93	36.21
1-5	21.04	10.51	15.73	16.19	9.77	16.20	8.11	25.20	21.12
5-10	4.60	2.98	3.84	4.04	2.37	4.38	2.62	3.73	5.00
10-15	2.08	1.76	1.97	1.66	1.00	1.91	1.59	1.98	2.07
15-20	2.17	2.49	2.59	1.85	1.22	2.14	2.13	2.39	2.06
20-30	5.46	7.30	3.14	4.83	4.10	5.37	5.58	5.62	4.76
30-40	5.14	6.40	6.42	5.34	4.65	5.70	6.54	5.90	4.97
40-50	5.45	6.90	6.68	5.62	5.13	6.44	7.17	6.89	5.63
50-60	6.63	8.83	7.02	7.49	7.31	7.84	9.43	7.24	6.23
60-70	8.82	12.75	8.32	8.91	10.67	8.84	13.22	8.62	6.88
70-80	8.14	14.50	9.72	8.07	9.55	6.74	12.39	6.68	4.14
80-90	3.33	6.21	7.60	2.79	3.20	2.35	4.08	2.50	1.06
90-100	0.37	0.57	2.09	0.27	0.23	0.24	0.27	0.31	0.16
Over 100	0.01	0.01	0.12	0.02	0.03	0.01	...	0.01	0.02
Unknown.	0.03	0.73	0.06	0.04	0.19

It will be seen that from nearly one-fifth to nearly one-third of the deaths were those of children less than twelve months old. The very high proportion of deaths at this age in Bavaria was some years ago made the subject of a special inquiry by Dr Mayr, and it was found to be largely due to the bad mode of bringing up infants peculiar to certain localities (Mayr, pp. 91, 319).

The composition of the death-rate in regard to sex must be touched on briefly. As we have seen, more boys are born than girls. Owing, however, to the greater mortality among the former their number is rapidly reduced during the first few years of life, so that at any given moment the population is composed as stated in the age scales. The exact mode in which a given number of persons born in the same year disappears by death is shown in the elaborate tables of mortality used by actuaries. These tables are different for different countries and for males and females. Very elaborate tables of survival were prepared for the British Government in 1883-84 for calculating annuities.

We cannot here deal with what is known as the "population question." Any adequate discussion of that highly important subject would involve considerations outside the limits of this article. The "population question" is a question of conduct, while the present article seeks only to point out certain well-ascertained facts regarding the phenomenon of superorganic evolution called population. The facts in question are general, and, though sufficient to indicate the nature of the phenomenon, and the broad divisions which are most convenient for its further investigation, are quite insufficient as the basis for the formation of any ethical judgment regarding the actions of the individuals composing the population.

Among the works that may be consulted to the greatest advantage by the student are the following:—the numerous works of the late Dr William Farr, F.R.S., formerly registrar-general; various works by Dr W. A. Guy, F.R.S.; those of Adolphe Quetelet; various monographs by Dr Ernst Engel, and other eminent statisticians in the official publications of the Prussian Statistical Office; various publications of the Italian Statistical Bureau; the publications of the International Congress of Statistics. Systematic treatment of the whole subject of population will be found in the following works:—Bertillon, *Mouvements de la Population dans divers états de l'Europe*, Paris, 1877; Maurice Block, *Traité théorique et pratique de statistique*, Paris, 1878; L. Bodio, *Movimento dello stato civile*, Rome, 1878 (publication of the Italian Statistical Bureau); A. Gabaglio, *Storia e teoria della statistica*, Milan, 1880; M. Haushofer, *Lehr- und Handbuch der Statistik*, Vienna, 1882. (W. HO.)

PORBEAGLE, the name of a shark (*Lamna cornubica*), mentioned in the works of older British authors as "Beaumaris Shark." The short and stout form of its body contrasts strikingly with its much attenuated tail, which, however, is strengthened by a keel on each side and terminates in a large and powerful caudal fin. The snout is pointed, and the jaws are armed with strong lanceolate teeth, each of which bears a small cusp on each side of the base (see fig.). The teeth are not adapted for cutting, like the flat triangular teeth of man-eating sharks, but rather for seizing and holding the prey, which consists chiefly of various kinds of fishes and cephalopods. In the upper jaw there are from thirteen to sixteen teeth on each side, the third being remarkable for its small size; in the lower jaw from twelve to fourteen. The

Upper and lower tooth of *Lamna*.

gill-openings are very wide. The porbeagle attains to a length of 10 or 12 feet, and is a pelagic fish, not rare in the North Atlantic and Mediterranean, and frequently wandering in pursuit of its prey to the British and more rarely to the American shores. The same species has been found in Japan and New Zealand, and perhaps also on the coast of California, so that the completion of the evidence as to its cosmopolitan range is merely a matter of time. Other closely-allied species (*L. spallanzanii*, *L. glauca*) are known to occur in the southern parts of the Atlantic, from the Mediterranean to the Cape of Good Hope. Very little is known of the mode of propagation of the porbeagle, beyond the isolated statement by Pennant that two embryos were found in a female. No opportunity should be lost of making further observations on this point, and of preserving if possible the fetuses in their enveloping tunics.

PORCELAIN. See **POTTERY**.

PORCUPINE. This word, derived from the French *porc-épic*, or "spiny pig," is applied to the members of the *Hystricidae*, a family of rodents whose most prominent peculiarity is their covering of long stout spines, which

Porcupine.

form a highly efficient protection against enemies, and which are better developed in this family than in any other mammal. Zoologically the porcupines are allied to the cavies, chinchillas, agoutis, &c., and with them form the great section *Hystricomorpha* or porcupine-like rodents (see **MAMMALIA**, vol. xv. p. 420).

The *Hystricidae* are readily divisible into two sub-families according to their geographical distribution, the *Hystricina* or True Porcupines being confined to the Old World, and the *Synetherina* to the New. The *Hystricina*

are distinguished by their semi-rooted molars, imperfect collar-bones, cleft upper lips, rudimentary pollices, smooth soles, six mammae, and by many important cranial characters. They range over the south of Europe, the whole of Africa, India, and the Malay Archipelago as far eastwards as Borneo. They are all stout heavily-built animals, with blunt rounded heads, fleshy mobile snouts, and coats of thick cylindrical or flattened spines, which form the whole covering of their body, and are not intermingled with ordinary hairs. Their habits are strictly terrestrial. Of the three genera in this section, the first and best-known is *Hystrix*, characterized by its curiously inflated skull, in which the nasal chamber is often considerably larger than the brain-case, and by its short tail, tipped with numerous slender stalked open quills, which make a loud rattling noise whenever the animal moves. Its longest-known member is the Common Porcupine (*H. cristata*), which occurs throughout the south of Europe and North and West Africa, but is replaced in South Africa by *H. africanaustralis*, and in India by the Hairy-nosed Porcupine (*H. leucura*), whose habits are described in the following notice extracted from Jerdon's *Mammals of India*.

"*Hystrix leucura* is found over a great part of India, from the lower ranges of the Himalayas to the extreme south, but does not occur in lower Bengal, where it is replaced by *H. bengalensis*. It forms extensive burrows, often in societies, in the sides of hills, banks of rivers and nullahs, and very often in the bunds of tanks, and in old mud walls, &c. &c. In some parts of the country they are very destructive to various crops, potatoes, carrots, and other vegetables. They never issue forth till after dark, but now and then one will be found returning to his lair in daylight. Dogs take up the scent of the porcupine very keenly, and on the Nilghiris I have killed many by the aid of dogs, tracking them to their dens. They charge backwards at their foes, erecting their spines at the same time, and dogs generally get seriously injured by their strong spines, which are sometimes driven deeply into the assailant. The porcupine is not bad eating,—the meat, which is white, tasting something between pork and veal."

Besides the three large crested species of *Hystrix* above-mentioned, there are some four or five smaller species without nuchal crests occurring in north-east India and in the Malay region, from Nepal to Borneo. The second genus of Old-World porcupines is *Atherura*, the Brush-tailed Porcupines, much smaller animals than the last, with long tails tipped with bundles of peculiar flattened spines. Of the three species two are found in the Malay region and one in West Africa. *Trichys*, the last genus, contains but one Bornean species, *T. lipura*, externally very like an *Atherura*, but differing from the members of that genus in many important cranial characteristics.

The New-World porcupines, the *Synetherina*, have rooted molars, complete collar-bones, uncleft upper lips, tuberculated soles, no trace of a pollex, and four mammae only. Their spines are to a great extent mixed with long soft hairs; they are less strictly nocturnal in their habits; and, with one exception, they live entirely in trees, having in correspondence with this long and powerful prehensile tails. They consist of three genera, of which the first is formed by the common Canadian Porcupine (*Erethizon dorsatus*), a stout heavily-built animal, with long hairs almost or quite hiding its spines, four anterior and five posterior toes, and a short stumpy tail. It is a native of the greater part of Canada and the United States, wherever there is any remnant of the original forest left. *Synetheres*, the second genus, contains some eight or ten species, known as Tree Porcupines, and found throughout the tropical parts of South America, one of them extending northwards into Mexico. They are of a lighter build than the ground porcupines, are covered with short, close, many-coloured spines often mixed with hairs, and their tails are always prehensile. Their hind feet have only four toes, owing to the suppression of the hallux, but instead they have a peculiar fleshy pad on the inner side of the foot,

between which and the toes boughs and other objects can be firmly grasped as with a hand. The last genus is *Chaetomys*, distinguished by the shape of its skull and the greater complexity of its teeth. It contains only one species, *C. subspinosus*, a native of the hottest parts of Brazil.

PORDENONE, IL (1483-1539), whose correct name was GIOVANNI ANTONIO LICINIO, or LICINO, was an eminent painter of the Venetian school. He was commonly named Il Pordenone from having been born in 1483 at Corticelli, a village near Pordenone,—a city of Italy, in the province of Udine (Friuli). He himself ultimately dropped the name of Licinio, having quarrelled with his brothers, one of whom had wounded him in the hand; he then called himself Regillo, or De Regillo. His signature runs "Antonius Portunaensis," or "De Portunaonis." He was created a cavaliere by Charles V.

As a painter Licinio was a scholar of Pellegrino da S. Daniele, but the leading influence which governed his style was that of Giorgione; the popular story that he was a fellow-pupil with Titian under Giovanni Bellini is incorrect. The district about Pordenone had been somewhat fertile in capable painters; but Licinio excelled them all in invention and design, and more especially in the powers of a vigorous chiaroscuro and flesh-painter. Indeed, so far as mere flesh-painting is concerned he was barely inferior to Titian in breadth, pulpiness, and tone; and he was for a while the rival of that great painter in public regard. The two were open enemies, and Licinio would sometimes affect to wear arms while he was painting. He excelled Giorgione in light and shade and in the effect of relief, and was distinguished in perspective and in portraits; he was equally at home in fresco and in oil-colour. He executed many works in Pordenone and elsewhere in Friuli, and in Cremona and Venice as well; at one time he settled in Piacenza, where is one of his most celebrated church pictures, St Catherine disputing with the Doctors in Alexandria; the figure of St Paul in connexion with this picture is his own portrait. He was formally invited by Duke Hercules II. of Ferrara to that court; here soon afterwards, in 1539, he died, not without suspicion of poison. His latest works are comparatively careless and superficial; and generally he is better in male figures than in female—the latter being somewhat too sturdy—and the composition of his subject-pictures is scarcely on a level with their other merits. Pordenone appears to have been a vehement self-asserting man, to which his style as a painter corresponds, and his morals were not unexceptionable. Three of his principal scholars were Bernardino Licinio, named Il Sacchiense, his son-in-law Pomponio Amalteo, and Giovanni Maria Calderari.

The following may be named among Pordenone's works:—the picture of S. Luigi Giustiniani and other Saints, originally in S. Maria dell' Orto, Venice; a Madonna and Saints, in the Venice academy; the Woman taken in Adultery, in the Berlin museum; the Annunciation, at Udine, regarded by Vasari as the artist's masterpiece, now damaged by restoration. In Hampton Court is a duplicate work, the Painter and his Family; and in Burghley House are two fine pictures now assigned to Pordenone—the Finding of Moses and the Adoration of the Kings. These used to be attributed to Titian and to Bassano respectively.

PORIFERA. See SPONGES.

PORISM. The subject of porisms is perplexed by the multitude of different views which have been held by famous geometers as to what a porism really was and is. This article must therefore be limited to a short historical account (1) of the principal works of the Greek mathematicians which we know to have been called *Porisms*, and (2) of some of the principal contributions to the elucidation of these works, and conjectures as to the true signification of the term.

The treatise which has given rise to the controversies on this subject is the *Porisms* of Euclid, the author of the

Elements. For as much as we know of this lost treatise we are indebted to the *Collection* of Pappus of Alexandria, who mentions it along with other geometrical treatises, and gives a number of lemmas necessary for understanding it. Pappus states that the porisms of Euclid are neither theorems nor problems, but are in some sort intermediate, so that they may be presented either as theorems or as problems; and they were regarded accordingly by many geometers, who looked merely at the form of the enunciation, as being actually theorems or problems, though the definitions given by the older writers showed that they better understood the distinction between the three classes of propositions. The older geometers, namely, defined a theorem as τὸ προτεινόμενον εἰς ἀπόδειξιν αὐτοῦ τοῦ προτεινόμενου, a problem as τὸ προβαλλόμενον εἰς κατασκευὴν αὐτοῦ τοῦ προτεινόμενου, and finally a porism as τὸ προτεινόμενον εἰς πορίσμων αὐτοῦ τοῦ προτεινόμενου. Pappus goes on to say that this last definition was changed by certain later geometers, who defined a porism on the ground of an accidental characteristic as τὸ λείπον ὑποθέσει τοπικοῦ θεωρήματος.

Proclus gives a definition of a porism which agrees very well with the fact that Euclid used the same word πόρισμα in his *Elements* for what is now called by the Latin name "corollary." Proclus's definition is Τὸ δὲ πόρισμα λέγεται μὲν ἐπὶ προβλημάτων τίνων, οἷον τὰ Εὐκλείδει γεγραμμένα πορίσματα. Λέγεται δὲ ἰδίως, ὅταν ἐκ τῶν ἀποδεδειγμένων ἄλλο τι συναφανῇ [συναποφανῇ (?)] θεώρημα, μὴ προθεμένων ἡμῶν, ὃ καὶ διὰ τοῦτο πόρισμα κεκλήκασιν ὥσπερ τι κέρδος ἐν τῇ ἐπιστημονικῇ ἀποδείξεως πάρεργον (Procl., *Comment. Eucl.*, p. 58; cf. p. 80).

Pappus gives a complete enunciation of a porism derived from Euclid, and an extension of it to a more general case. This porism, expressed in modern language, asserts that, *Given four straight lines of which three turn about the points in which they meet the fourth, if two of the points of intersection of these lines lie each on a fixed straight line, the remaining point of intersection will also lie on another straight line; or, If the sides of a triangle are made to turn each about one of three fixed points in a straight line, and if two of the vertices are made to move on two fixed straight lines, taken arbitrarily, the third vertex describes a third straight line.* The general enunciation applies to any number of straight lines, say $(n+1)$, of which n can turn about as many points fixed on the $(n+1)$ th. These n straight lines cut, two and two, in $\frac{n(n-1)}{2}$ points, $\frac{n(n-1)}{2}$

being a triangular number whose side is $(n-1)$. If, then, they are made to turn about the n fixed points so that any $(n-1)$ of their $\frac{n(n-1)}{2}$ points of intersection lie on $(n-1)$ given fixed straight lines, then each of the remaining points of intersection, $\frac{(n-1)(n-2)}{2}$ in number, describes

a straight line. Pappus gives also a complete enunciation of one porism of the first book of Euclid's treatise. This may be expressed thus: If about two fixed points P, Q we make turn two straight lines meeting on a given straight line L, and if one of them cut off a segment AM from a fixed straight line AX, given in position, we can determine another fixed straight line BY, and a point B fixed on it, such that the segment BM' made by the second moving line on this second fixed line measured from B has a given ratio λ to the first segment AM. The rest of the enunciations given by Pappus are incomplete, and he merely says that he gives thirty-eight lemmas for the three books of porisms; and these include 171 theorems.

The lemmas which Pappus gives in connexion with the porisms are interesting historically, because he gives (1)

the fundamental theorem that the cross or anharmonic ratio of a pencil of four straight lines meeting in a point is constant for all transversals; (2) the proof of the harmonic properties of a complete quadrilateral; (3) the theorem that, if the six vertices of a hexagon lie three and three on two straight lines, the three points of concurrence of opposite sides lie on a straight line.

During the last three centuries this subject seems to have had great fascination for mathematicians, and many geometers have attempted to restore the lost porisms. Thus Albert Girard expresses in his *Traité de Trigonométrie* a hope that he will be able to restore them. About the same time Fermat wrote a short work under the title *Porismatum Euclidæorum renovata doctrina et sub forma isagoges recentioribus geometris exhibita*. He seems to have concerned himself only with the character and object of Euclid's work; but, though he seems to assert that he has restored the work, the examples of porisms which he gives have no connexion with those propositions indicated by Pappus. Fermat's idea of a porism was that it is nothing more than a locus. We may next mention Halley, who published the Greek text of the preface to Pappus's seventh book with a Latin translation, but with no comments or elucidations, remarking at the end that he has not been able to understand this description of porisms, which (he maintains) is made unintelligible by corruptions and lacunæ in the text. Robert Simson was the first to throw real light on the subject. His first great triumph was the explanation of the only three propositions which Pappus indicates with any completeness. This explanation was published in the *Philosophical Transactions* in 1723; but Simson did not stop there. After his first success he set himself to investigate the subject of porisms generally, and the result appears in a work entitled *De porismatibus tractatus; quo doctrinam porismatum satis explicatam, et in posterum ab oblivione tutam fore sperat auctor*. This work, however, was not published until after Simson's death; it appeared at Glasgow in 1776 as part of a volume, *Roberti Simson, matheseos nuper in academia Glasguensi professoris, opera quædam reliqua*. Simson's treatise, *De porismatibus*, begins with definitions of theorem, problem, datum, porism, and locus. Respecting the porism Simson says that Pappus's definition is too general, and therefore he will substitute for it the following: "Porisma est propositio in qua proponitur demonstrare rem aliquam vel plures datas esse, cui vel quibus, ut et cuilibet ex rebus innumeris non quidem datis, sed quæ ad ea quæ data sunt eandem habent relationem, convenire ostendendum est affectionem quandam communem in propositione descriptam. Porisma etiam in forma problematis enuntiari potest, si nimirum ex quibus data demonstranda sunt, invenienda proponantur." A locus (says Simson) is a species of porism. Then follows a Latin translation of Pappus's note on the porisms, and the propositions which form the bulk of the treatise. These are Pappus's thirty-eight lemmas relating to the porisms, ten cases of the proposition concerning four straight lines, twenty-nine porisms, two problems in illustration, and some preliminary lemmas. Playfair's memoir (*Trans. Roy. Soc. Edin.*, vol. iii., 1794) may be said to be a sort of sequel to Simson's treatise, having for its special object the inquiry into the probable origin of porisms,—that is, into the steps which led the ancient geometers to the discovery of them. Playfair's view was that the careful investigation of all possible particular cases of a proposition led to the observation that (1) under certain conditions a problem becomes impossible; (2) under certain other conditions, indeterminate or capable of an infinite number of solutions. These cases could be enunciated separately, were in a manner intermediate be-

tween theorems and problems, and were called "porisms." Playfair accordingly defined a porism thus: "A proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate or capable of innumerable solutions." This definition, he maintained, agreed both with Pappus's account and Simson's definition, the obscurity of which he attempts to remedy by the following translation: "A porism is a proposition in which it is proposed to demonstrate that one or more things are given, between which and every one of innumerable other things not given, but assumed according to a given law, a certain relation, described in the proposition, is to be shown to take place."¹ This definition of a porism appears to be most generally accepted, at least in England. However, in *Liouville's Journal de mathématiques pures et appliquées* (vol. xx., July, 1855) P. Breton published *Recherches nouvelles sur les porismes d'Euclide*, in which he propounded a different theory, professedly based on the text of Pappus, as to the essential nature of a porism. This was followed in the same journal by a controversy between Breton and A. J. H. Vincent, who disputed the interpretation given by the former of the text of Pappus, and declared himself in favour of the idea of Schooten, put forward in his *Mathematicæ exercitationes* (1657), in which he gives the name of "porism" to one section. According to Schooten, if we observe the various numerical relations between straight lines in a figure and write them down in the form of equations or proportions, then the combination of these equations in all possible ways, and of new equations thus derived from them, leads to the discovery of innumerable new properties of the figure, and here we have a porism. It must be admitted that, if we are to judge of the meaning by the etymology of the name, this idea of a porism has a great deal to recommend it. We must, however, be on our guard against applying, on this view, the term "porism" to the process of discovery. The Greek word *πόρισμα* should no doubt strictly signify the result obtained, but the name is still indicative of the process. The porism is the result as obtained by the process, which is itself the cause of the name. So great an authority as Chasles wrote in 1860 (*Les trois livres de porismes d'Euclide*) that, in spite of the general assent which Playfair's theory met with, he considered it to be unfounded.

The *Porisms* of Euclid are not the only representatives of this class of propositions. We know of a treatise of Diophantus which was entitled *Porisms*. But it is uncertain whether these lost *Porisms* formed part of the *Arithmetics* or were an independent treatise. Diophantus refers to them in the *Arithmetics* in three places, introducing a proposition assumed as known with the words *ἐχομεν ἐν τοῖς πορίσμασιν*. These propositions are not, however, all similar in form, and we cannot by means of them grasp what Diophantus understood to be the nature of a porism. So far as we can judge of his treatise it seems to have been a collection of a number of ordinary propositions in the theory of numbers, some of them being mere algebraical identities. Again, Diophantus should probably be included among the *νεώτεροι* who are said to have substituted a new definition for that of the ancients, looking only to accidental not essential characteristics of a true porism. And yet, in so far as Diophantus's *Porisms* had no connexion with geometry, they do not in the least conform to the second definition of Pappus.

We have by no means exhausted the list of writers who have propounded theories on the subject of porisms. It must, however, suffice merely to mention the chief among the rest of the contributions to the subject. These are, besides the papers of Vincent and

¹ This view of porisms is known exclusively by the name of Playfair, though, as he himself says, Dugald Stewart had several years before defined a porism to be "a proposition affirming the possibility of finding one or more of the conditions of an indeterminate theorem."

Breton, the following books or tracts on the *Porismen* of Euclid:—Aug. Richter, *Porismen nach Simson*, 4to, Leipzig, 1837; Ch. Housel, "Les Porismes d'Euclide," in *Journal de mathématiques pures et appliquées* (2d ser., vol. i., 1856); M. Cantor, "Ueber die Porismen des Euklid und deren Divinatoren," in *Schlömilch's Zeitsch. f. Math. u. Phys.*, 1857, and *Literaturzeitung*, 1861, p. 3 sq.; Th. Leidenfrost, *Die Porismen des Euklid* (Programm der Realschule zu Weimar, 1863); Fr. Buchbinder, *Euclid's Porismen und Data* (Programm der kgl. Landesschule Pforta, 1866). (T. L. H.)

POROS, or Poro ("The Ford"), an island off the east coast of the Morea, separated at its western extremity by only a narrow channel from the mainland at Trezen, and consisting of a mass of limestone rock and of a mass of trachyte connected by a slight sandy isthmus. The town, which is at the head of an eparchy with 5414 inhabitants (1879), has its "houses perched among the volcanic rocks," and looks down on the beautiful harbour between the island and the mainland on the south, which between 1830 and 1877 was the seat of a national arsenal.

The ancient Calauria, with which Poros is identified, was given, according to the myth, by Apollo to Poseidon in exchange for Delos; and it became in historic times famous for a temple of the sea-god, which formed the centre of an amphictyony of seven maritime states—Hermione, Epidaurus, Ægina, Athens, Prasia, Nauplia, and Orchomenus. It was there that Demosthenes took sanctuary with "gracious Poseidon," and, when this threatened to fail him, sought the more inviolable asylum of death. The building was of Doric architecture and lay on a plateau near the middle of the limestone part of the island, which now contains a monastery. In the neighbourhood of Poros-Calauria are two small islands, the more westerly of which contains the ruins of a small temple, and is probably the ancient Sphæria¹ or Hiera mentioned by Pausanias as the seat of a temple of Athena Apaturia. It was at Poros that the English, French, and Russian plenipotentiaries met in 1828 to discuss the basis of the Greek government.

See Chandler, *Travels*; Leake, *Morea*; Le Bas, *Voyage archéologique*; Curtius, *Peloponnesos*; Pouillon-Boblaye, *Recherches*; Bursian, *Geographie von Griechenland*; and Rangabé, "Ein Ausflug nach Poros," in *Deutsche Revue*, 1883.

PORPHYRY, a name originally applied to a reddish or purple rock (*πορφύρεος*, purple) found in Upper Egypt, principally at Jebel Dokhan, and much used by the ancients as a decorative stone. This porphyry, the *porfido rosso antico* of Italian antiquaries, consists of a dark crimson or chocolate-coloured felsitic base, with disseminated crystals of white felspar, probably oligoclase. It was a favourite material with Roman sculptors under the lower empire, and notwithstanding its excessive hardness was worked into large sarcophagi and other objects, ornamented in some cases in elaborate relief. This porphyry was also ingeniously used for the lower part of the busts of Roman emperors, the head being executed in another material, while the porphyry was used for the drapery, the colour of the stone suggesting that of the imperial purple. The antique red porphyry is often confounded with the *rosso antico*, which, being merely a red marble, is a much softer stone.

The term "porphyry" has been gradually extended to a variety of rocks which contain distinct crystals of any mineral sprinkled through a fine-grained ground. Among the best known of the ancient porphyries is the *porfido verde antico*, or *lapis Lacedæmonius*, a beautiful rock with pale-green crystals of labrador-felspar, found at Mount Taygetus in the Morea. The meaning of the word "porphyry" has become so vague, in consequence of its application to many rocks widely differing from each other in composition, that there is a tendency among modern petrologists to abandon its use as a substantive, and merely to retain the adjective "porphyritic" as a convenient designation for all rocks which exhibit a structure like that of the ancient porphyry. Any rock, whatever its mineralogical composition, may therefore become porphyritic by containing isolated crystals developed in a compact or micro-crystalline matrix. Among the finest rocks of this class in

Britain are the porphyritic granites of Cornwall and of Shap in Westmoreland; the elvans, or quartz-porphyrines (see vol. x. p. 233), which occur as dykes cutting through the slates and granites of Cornwall; the peculiar rock termed "luxullianite" (see vol. xi. p. 49); and the green and red porphyritic felstones of Cumberland. A beautiful brown porphyritic felstone occurs at Buchan Ness, on the coast of Aberdeenshire; while a rock closely resembling the antique green porphyry is found on Lambay Island, near Dublin. For a description of porphyrite, see vol. x. p. 234.

PORPHYRY (c. 233-306). See NEOPLATONISM, vol. xvii. p. 336 sq.

PORPOISE (sometimes spelled PORPUS and PORPESSE). The word is apparently derived from the French *porc* and *poisson*, or the Italian *porco* and *pesce*, and thus corresponds with some of the English vernacular appellations, "hog-fish," "sea-hog," "herring-hog," and the German *Meerschwein*, whence the usual modern French name of the animal, *marsouin*. "Porpoise" is commonly used by sailors to designate all the smaller cetaceans, especially those numerous species which naturalists call "dolphins"; but in scientific language it is restricted to a particular form constituting the genus *Phocæna* of Cuvier, of which the Common Porpoise of the British seas, *Phocæna communis*, Cuvier (*Delphinus phocæna*, Linnæus), is the type. The essential characters by which the genus is separated from the other members of the order *Cetacea* are described in the article MAMMALIA (vol. xv. p. 398).

The common porpoise, when full grown, attains a length

FIG. 1.—*Phocæna communis*.

of 5 feet or a little more. The dimensions of an adult female specimen from the English Channel were as follows:—length in straight line from nose to median notch between the flukes of the tail, 62½ inches; from the nose to the anterior edge of the dorsal fin, 29 inches; height of dorsal fin, 4½ inches; length of base of dorsal fin, 8 inches; length of pectoral fin, 9¼ inches; breadth of pectoral fin, 3½ inches; breadth of tail flukes, 13 inches. The head is rounded in front, and differs from that of the true dolphins in not having the snout produced into a distinct "beak" separated from the frontal eminence by a groove. The under jaw projects about half an inch beyond the upper one. The aperture of the mouth is tolerably wide, and is bounded by stiff immobile lips, and curves slightly upwards at the hinder end. The eye is small, and the external ear represented by a minute aperture in the skin, scarcely larger than would be made by the puncture of a pin, situated about 2 inches behind the eye. The dorsal fin is placed near the middle of the back, and is low and triangular. The pectoral fins are of moderate size, and slightly falcate.

¹ Some writers identify Calauria with one half only of Poros, and consider that the other half was in antiquity a separate island, to be identified with Sphæria.

The horizontally-expanded caudal fin is of the form common to all *Cetacea*. The external surface, as in the rest of the order, is smooth, shining, and devoid of hair, though in the foetal condition a few bristles are found near the nose. The upper parts are dark grey, or nearly black, according to the light in which they are viewed, and the state of moisture or otherwise of the skin; the under parts are pure white. The line of demarcation between these colours is not distinct, washes or splashes of grey encroaching upon the white on the sides, and varies somewhat in different individuals. Usually it passes from the throat (the anterior part of which, with the whole of the under jaw, is dark) above the origin of the pectoral fin, along the middle of the flank, and descends again to the middle line before reaching the tail. Both sides of the pectoral and caudal fins are black. The anterior edge of the dorsal fin is often furnished with a row of small rounded horny spines or rather tubercles of very variable number, which have been thought to indicate a specific distinction between the animals possessing them (*Phocaena tuberculifera*, Grey) and those without them, but this has not been confirmed by other characters. One of the most characteristic anatomical distinctions between the porpoise and other members of the *Delphinidae* is the form of the teeth, which

FIG. 2.—Teeth of Porpoise. Twice natural size.

(numbering twenty-three to twenty-six on each side of each jaw) instead of the usual conical, sharp-pointed, recurved shape, all have expanded, flattened, spade-like crowns, with more or less marked vertical grooves, giving a tendency to a bilobed or often trilobed form (see fig. 2).

The porpoise is sociable and gregarious in its habits, being usually seen in small herds, and frequents coasts, bays, and estuaries rather than the open ocean. It is the commonest cetacean in the seas around the British Isles, and not unfrequently ascends the river Thames, having been seen as high up as Richmond; it has also been observed in the Seine at Neuilly, near Paris. It frequents the Scandinavian coasts, entering the Baltic in the summer; and it is found as far north as Baffin's Bay, and as far west as the coasts of the United States. Southward its range is more limited than that of the common dolphin, as, though very common on the Atlantic coasts of France, it is not known to enter the Mediterranean.

It feeds on fish, such as mackerel, pilchards, and herrings, of which it devours large quantities, and, following the shoals, is often caught by fishermen in the nets along with its prey. In former times it was a common and esteemed article of food in England and in France, but is now rarely if ever eaten, being commercially valuable when caught only for the oil obtained from its blubber. Its skin is sometimes used for leather and boot-thongs, but the so-called "porpoise hides" are generally obtained from a different and larger species of cetacean, the *Beluga* of the northern seas.

A closely similar if not identical species from the American coast of the North Pacific has been described under the name of *Phocaena vomerina*, and another from the mouth of the Rio de la Plata as *P. spinipennis*. Another nearly allied form is *Leomeria phocaenoides*, a small species from the Indian Ocean and Japan, with teeth of the same form as those of the common porpoise, but fewer in number (eighteen to twenty on each side of each jaw) and of larger size, and more distinctly notched or lobed on the free edge. It is distinguished from the common porpoise externally by its entirely black colour and the complete absence of a dorsal fin.

PORPORA, NICCOLA (or **NICCOLO**) **ANTONIO** (1686-1767), operatic composer and teacher of singing, was born in Naples on 19th August 1686, and educated at the Conservatorio di Santa Maria di Loreto by Gaetano Greco

and Francesco Mancini. His first opera, *Basilio*, was produced at Naples, his second, *Berenice*, at Rome. Both were very successful, and he followed them up by innumerable compositions of like character; but his fame rests chiefly upon his power of teaching singing—an art in which he has never been surpassed, if even equalled. At the Conservatorio di San Onofrio and the Poveri di Gesu Cristo he trained the finest voices of the age. Farinelli—the greatest singer who ever lived—Caffarelli, Mingotti, Salimbeni, and other celebrated vocalists owed all they ever knew to his teaching. Still his numerous engagements did not tempt him to forsake composition. In 1725 he visited Vienna, but the emperor Charles VI. disliked his florid style, especially his constant use of the *trillo*, and refused to patronize him. After this rebuff he settled in Venice, teaching regularly in the schools of La Pietà and the Incurabili. In 1728 he removed to Dresden, where he was received with great cordiality by the electoral princess Maria. In 1729 he was invited to London as a rival to Handel; but his visit was an unfortunate one. Little less disastrous was his second visit to England in 1734, when even the presence of his pupil, the great Farinelli, failed to save the dramatic company known as the "Opera of the Nobility" from ruin. In order to fulfil his English engagement he procured a release from that previously contracted in Dresden; but he finally quitted London in 1736, and again settled in Venice. There he remained until 1745, when he returned to Vienna in the suite of the Venetian ambassador, giving lessons in 1754 to the young Joseph Haydn, and returning in 1759 to his birthplace, Naples. From this time Porpora's career was a series of misfortunes. His last opera, *Camilla*, failed; and he became so miserably poor that the expenses of his funeral were paid by subscription. Yet at the moment of his death (1767) Farinelli and Caffarelli were living in princely splendour on fortunes for which they were indebted to the excellence of the old maestro's teaching.

Porpora was a learned scholar, an accomplished linguist, and a genial wit. Some excellent stories are told in illustration of this last-named characteristic. His compositions are masterly and brilliant, but less remarkable for depth of feeling than for technical display. The style of his oratorios and cantatas is far more elevated than that of his numerous operas.

PORSENA or **PORSENNA**, king of Clusium. See **ETRURIA**, vol. viii. p. 635, and **ROME**.

PORSON, RICHARD (1759-1808), in some respects the greatest of modern Greek scholars, was born on Christmas Day 1759 at East Ruston, near North Walsham, in Norfolk, the eldest son of Mr Huggin Porson, parish clerk of the place. His mother was the daughter of a shoemaker named Palmer, of the neighbouring village of Bacton. He was sent first to the village school at Bacton, kept by Mr John Woodrow, and afterwards to that of Happisburgh, kept by Mr Summers. Here his extraordinary powers of memory and aptitude for arithmetic were soon discovered; his skill in penmanship, which attended him through life, was very much due to the care of Mr Summers, who became early impressed with his abilities, and long afterwards stated that during fifty years of scholastic life he had never come across boys so clever as Porson and his two brothers. He was well grounded in Latin by Mr Summers, remaining with him three years. His father also took great pains with his education, making him repeat at night the lessons he had learned in the day. He would frequently repeat without making a mistake a lesson which he had learned one or two years before and had never seen in the interval. For books he had only what his father's cottage supplied—a book or two of arithmetic, Greenwood's *England*, Jewell's *Apology*, an odd volume of Chambers's *Cyclopædia* picked up from a wrecked coaster, and eight or ten volumes of the *Universal Magazine*.

The brilliant promise of the parish clerk's son naturally became known to the clergyman; and when he was eleven years old the Rev. T. Hewitt, the curate of East Ruston and two neighbouring villages, took charge of his education, keeping him and one of his brothers at his house at Bacton during the week, and sending them home for the Sunday. Mr Hewitt taught him with his own boys, taking him through the ordinary Latin authors, Cæsar, Terence, Ovid, and Virgil; before this he had made such progress in mathematics as to be able to solve questions out of the *Ladies' Diary*. In addition to this Mr Hewitt brought him under the notice of Mr Norris of Witton Park, who sent him to Cambridge and had him examined by Professor Lambert, the two tutors of Trinity, Postlethwaite and Collier, and the well-known mathematician Atwood, then assistant tutor; the result was so favourable a report of his knowledge and abilities that Mr Norris determined to provide for his education so as to fit him for the university. This was in 1773. It was found impossible to get him into Charterhouse, and he was entered on the foundation of Eton in August 1774.

Of his Eton life Porson had not very pleasant recollections, but he was a popular boy among his schoolfellows; and two dramas he wrote for performance in the Long Chamber are still remembered. His marvellous memory was of course noticed; but at first he seems to have somewhat disappointed the expectations of his friends, as his composition was weak, and his ignorance of quantity kept him behind several of his inferiors. He went to Eton too late to have any chance of succeeding to a scholarship at King's College. In 1777 he suffered a great loss from the death of his patron Mr Norris; but contributions from Etonians to aid in the funds for his maintenance at the university were readily supplied, and he found a successor to Mr Norris in Sir George Baker, the well-known physician, who was at that time president of the college of physicians. And chiefly through his means Porson was entered of Trinity College, Cambridge, as a pensioner on 28th March 1778, and commenced his residence there soon afterwards, matriculating in April of that year. It is said that what first biassed his mind towards critical researches was the gift of a copy of Toup's *Longinus* by Dr Davies, the headmaster of Eton, for a good exercise; but it was Bentley and Dawes to whom he looked as his immediate masters. His critical career was begun systematically while an undergraduate; and it was doubtless during the period of his residence at Cambridge that his marvellous stores of learning were laid up for future use. He became a scholar of Trinity College in 1780, won the Craven university scholarship in 1781, and took his degree of B.A. in 1782, as third senior optime, obtaining soon afterwards the first chancellor's medal for classical studies. The same year he was elected Fellow of Trinity College, a very unusual thing for a junior bachelor of arts, as the junior bachelors were very rarely allowed to be candidates for fellowships, a regulation which lasted from 1667 when Isaac Newton was elected till 1818 when Connop Thirlwall became a fellow. Porson graduated M.A. in 1785.

Having thus early secured his independence, he turned his thoughts to publication. The first occasion of his appearing in print was in a short notice of Schutz's *Æschylus* in *Maty's Review*, written in 1783. This review contains several other essays by his hand; especially may be mentioned the reviews of Brunck's *Aristophanes* (an admirable specimen of clear and vigorous English, and containing a very able summary of the Greek comic poet's chief excellences and defects), Weston's *Hermesianax*, and Huntingford's *Apology for the Monstrophics*. But it was to the tragedians, and especially to *Æschylus*, that his mind was then chiefly directed. He began a correspondence with

David Ruhnken, the veteran scholar of Leyden, requesting to be favoured with any fragments of *Æschylus* that Ruhnken had come across in his collection of inedited lexicons and grammarians, and sending him, as a proof that he was not undertaking a task for which he was unequal, some specimens of his critical powers, and especially of his restoration of a very corrupt passage in the *Supplives* (673-677) by the help of a nearly equally corrupt passage of Plutarch's *Eroticus*. As the syndics of the Cambridge press were proposing to re-edit Stanley's *Æschylus*, the editorship was offered to Porson; but he declined to undertake it on the conditions laid down, namely, of reprinting Stanley's corrupt text and incorporating all the variorum notes, however worthless. He was especially anxious that the Medicean MS. at Florence should be collated for the new edition, and offered to undertake the collation at an expense not greater than it would have cost if done by a person on the spot; but the syndics refused the offer, the vice-chancellor (then Mr Torkington, master of Clare Hall) observing that Mr Porson might collect his MSS. at home.

In 1786, a new edition of Hutchinson's *Anabasis* of Xenophon being called for, Porson was requested by the publisher to supply a few notes, which he did in conjunction with the Rev. W. Whiter, editor of the *Etymologicon universale*. These give the first specimen of that neat and terse style of Latin notes in which he was afterwards to appear without a rival. They also show already his intimate acquaintance with his two favourite authors, Plato and Athenæus, and a familiarity with Eustathius's commentary on Homer.

The next year, 1787, the *Notæ breves ad Toupii Emendationes in Suidam* were written, though they did not appear till 1790 in the new edition of Toup's book published at Oxford. These first made Porson's name known as a scholar of the first rank, and carried his fame beyond England. The letters he received from Heyne and Hermann, still preserved in the library of Trinity College, and written before his *Euripides* was published, afford a sufficient proof of this. In his notes he does not hesitate to point out the errors of Toup and others; at the same time he speaks of Toup's book as "opus illud aureum," and states that his writing the notes at all is due to the admiration he had for it. They contain some very brilliant emendations of various authors; but the necessity of having Toup's own notes with them has prevented their ever being reprinted in a separate form.

During this year, in the *Gentleman's Magazine*, he wrote the three letters on Hawkins's *Life of Johnson* which have been reprinted by Mr Kidd in his *Tracts and Criticisms of Porson*, and in the volume of Porson's *Correspondence*. They are admirable specimens of the dry humour so characteristic of the writer, and afford also proofs of his intimate acquaintance with Shakespeare and the other English dramatists and poets. In the same periodical, in the course of the years 1788 and 1789, appeared the *Letters to Archdeacon Travis, on the spurious verse 1 John v. 7* (collected in 1790 into a volume), which must be considered to have settled the question as to the spuriousness of the verse for ever. Gibbon's verdict on the book, that it was "the most acute and accurate piece of criticism since the days of Bentley," may be considered as somewhat partial, as it was in defence of him that Porson had entered the field against Travis. But in the very masterly sketch of Gibbon's work and style in the preface Porson does not write in a merely flattering tone. It is to be wished that on such a subject the tone of levity had been modified. But Porson says in his preface that he could treat the subject in no other manner, if he treated it at all: "To peruse such a mass of falsehood and

sophistry and to write remarks upon it, without sometimes giving way to laughter and sometimes to indignation, was, to me at least, impossible." Travis has no mercy shown him, but he certainly deserved none. One is equally struck with the thorough grasp Porson displays of his subject, the amount of his miscellaneous learning, and the humour that pervades the whole. But it was then the unpopular side: the publisher is said to have lost money by the book; and one of his early friends, Mrs Turner of Norwich, cut down a legacy she had left Porson to £30 on being told that he had written what was described to her as a book against Christianity.

During the years that followed he continued to contribute to the leading reviews, writing in the *Monthly Review* the articles on Robertson's *Parian Chronicle*, Edwards's *Plutarch*, and Payne Knight's *Essay on the Greek Alphabet*. He gave assistance to Beloe in one or two articles in the *British Critick*, and probably wrote also in the *Analytical Review* and the *Critical Review*.

In the year 1792 his fellowship was no longer tenable by a layman; and, rather than undertake duties for which he felt himself unfit, and which involved subscription to the Articles (though he had no difficulty as to signing a statement as to his conformity with the liturgy of the Church of England when elected Greek professor), he determined not to take holy orders, which would have enabled him to remain a fellow, and thus deprived himself of his only means of subsistence. He might have been retained in the society by being appointed to a lay fellowship, one of the two permanent lay fellowships which the statutes then permitted falling vacant just in time. It is said that this had been promised him, and it was certainly the custom in the college always to appoint the senior among the existing laymen, who otherwise would vacate his fellowship. But the master (Dr Postlethwaite), who had the nomination, used his privilege to nominate a younger man (John Heys), a nephew of his own, and thus Porson was turned adrift without any means of support. A subscription was, however, got up among his friends to provide an annuity to keep him from actual want; Mr Cracherode, Mr Cleaver Banks, Dr Burney, and Dr Parr took the lead, and enough was collected to produce about £100 a year. He accepted it only on the condition that he should receive the interest during his lifetime, and that the principal, placed in the hands of trustees, should be returned to the donors at his death. When this occurred they or their survivors refused to receive the money, and the Porson prize at Cambridge was founded with this sum to perpetuate his name.

After the loss of his fellowship he continued chiefly to reside in London, having chambers in Essex Court, Temple, —occasionally visiting his friends, such as Dr Goodall at Eton and Dr Parr at Hatton. It was at Dr Goodall's house that the *Letters to Travis* were written, and at one period of his life he spent a great deal of time at Hatton. While there he would generally spend his mornings in the library, and for the most part in silence; but in the evenings, especially if Parr were away, he would collect the young men of the house about him, and pour forth from the rich stores of his memory torrents of every kind of literature—"pages of Barrow, whole letters of Richardson, whole scenes of Foote, favourite pieces from the periodical press." The charms of his society are described as being then irresistible. "Nothing," said one of his friends, "could be more gratifying than a tête-à-tête with him; his recitations from Shakespeare, and his ingenious etymologies and dissertations on the roots of the English language were a high treat." "Nothing," says another, "came amiss to his memory; he would set a child right in his twopenny fable-book, repeat the whole of the moral

tale of the Dean of Badajos, or a page of Athenæus on cups, or Eustathius on Homer." An anecdote is told of his repeating the *Rape of the Lock*, making observations, as he went on, and noting the various readings; of which one of the company said, "Had it been taken down from his mouth and published, it would have made the best edition of that poem yet in existence."

In 1792 the Greek professorship at Cambridge became vacant by the resignation of Mr Cooke. To this Porson was elected without opposition, and he continued to hold it till his death. The duties then consisted in taking a part in the examinations for the university scholarships and classical medals. It was said he wished to give lectures; but lecturing was not in fashion in those days, and he did far more to advance the knowledge and study of the Greek language by his publications than he could have done by any amount of lecturing. It must be remembered that the emoluments of the professorship were only £40 a year. The authors on which his time was chiefly spent were the tragedians, Aristophanes, Athenæus, and the lexicons of Suidas, Hesychius, and Photius. This last he twice transcribed (the first transcript having been destroyed by a fire at Perry's house, which deprived the world of much valuable matter that he had written on the margins of his books) from the original among the Gale MSS. in the library of Trinity College. Of the brilliancy and accuracy of his emendations on Aristophanes, the fragments of the other comic poets, and the lexicographers he had a pleasing proof on one occasion when he found how often in Aristophanes he had been anticipated by Bentley, and on another when Schow's collation of the unique MS. of Hesychius appeared and proved him right in "an incredible number" of instances.

In 1795 there appeared from Foulis's press at Glasgow an edition of Æschylus in folio, printed with the same types as the Glasgow Homer, without a word of preface or anything to give a clue to the editor. Many new readings were inserted in the text with an asterisk affixed, while an obelus was used to mark many others as corrupt. It was at once recognized as Porson's work; he had superintended the printing of a small edition in two vols. 8vo, but this was kept back by the printer and not issued till 1806, still without the editor's name. There are corrections of many more passages in this edition than in the folio; and, though the text cannot be considered as what would have gone forth if with his name and sanction, yet more is done for the text of Æschylus than had been accomplished by any preceding editor. It has formed the substratum for all subsequent editions. It was printed from a copy of Pauw's edition corrected, which is still preserved in the library of Trinity College.

Soon after this, in 1797, appeared the first instalment of what was intended to be a complete edition of Euripides, —an edition of the *Hecuba*.

In the preface he pointed out the correct method of writing several words previously incorrectly written, and gave some specimens of his powers on the subject of Greek metres. The notes are very short, almost entirely critical; but so great a range of learning, combined with such felicity of emendation whenever a corrupt passage was encountered, is displayed that there was never any doubt as to the quarter whence the new edition had proceeded. He expressly avoided the office of interpreter in his notes, which may well be wondered at on recollecting how admirably he did translate when he condescended to that branch of an editor's duties: "si quis erat locus Anglice exhibendus," says Dobree, "tum vero omnes in stuporem dabat."

His work, however, did not escape attack; Gilbert Wakefield had already published a *Tragediarum Delectus*; and, conceiving himself to be slighted, as there was no mention of his labours in the new *Hecuba*, he wrote a "diatribe extemporalis" against it, a tract which for bad taste, bad Latin, and bad criticism it would not be easy to match. And Gottfried Hermann of Leipsic, then a very young man, who had also written a work on Greek metres, which

Dr Elmsley has styled "a book of which too much ill cannot easily be said," issued an edition of the *Hecuba*, in which Porson's theories were openly attacked. Porson at first took no notice of either, but went on quietly with his Euripides, publishing the *Orestes* in 1798, the *Phænissæ* in 1799, and the *Medea* in 1801, the last printed at the Cambridge press, and with the editor's name on the title-page. But there are many allusions to his antagonists in the notes on such points as the final *v*, the use of accents, &c.; and on *v*. 675 of the *Medea* he holds up Hermann by name to scorn in caustic and taunting language. And it is more than probable that to Hermann's attack we owe the most perfect of his works, the supplement to the preface to the *Hecuba*, prefixed to the second edition published at Cambridge in 1802. Porson's dislike of composition made him indolent, but he came forward now in his own defence, and probably of all the pieces of minute criticism that have appeared on those subjects the first place must be given to this. The beauty of the style, the steps by which the reader is carried on from one point to another, and the richness of illustration make it one of the most entertaining of diatribes. The metrical laws promulgated are laid down clearly, illustrated with an ample number of examples, and those that militate against them brought together and corrected, so that what had been beyond the reach of the ablest scholars of preceding times is made clear to the merest tyro. It is here that the laws of the iambic metre are fully explained, and the theory of the pause stated and proved, which had been only alluded to in the first edition. A third edition of the *Hecuba* appeared in 1808, and he left corrected copies of the other plays, of which new editions appeared soon after his death; but these four plays were all that was accomplished of the projected edition of the poet. Porson lived six years after the second edition of the *Hecuba* was published, but his natural indolence and procrastination led him to put off carrying on the work till death put a stop to this and all other literary projects. He found time, however, to execute his collation of the Harleian MS. of the *Odyssey*, published in the Grenville *Homers* in 1801, and to present to the Society of Antiquaries his wonderful conjectural restoration of the Rosetta stone.

In 1806, when the London Institution was founded (then in the Old Jewry, since removed to Finsbury Circus), he was appointed principal librarian with a salary of £200 a year and a suite of rooms; and thus his latter years were made easy as far as money was concerned.

Among his most intimate friends was Perry, the editor of the *Morning Chronicle*; and this friendship was cemented by his marriage with Perry's sister, Mrs Lunan, in November 1796. The marriage was a happy one for the short time it lasted, as Porson became more attentive to times and seasons, and would have been weaned from his habits of drinking; but she sank in a decline a few months after her marriage (12th April 1797), and he returned to his chambers in the Temple and his old habits. Perry's friendship was of great value to him in many ways; but it induced him to spend too much of his time in writing for the *Morning Chronicle*; indeed he was even accused of "giving up to Perry what was meant for mankind," and the existence of some of the papers he wrote there can be only deplored.

For some months before his death he had appeared to be failing; his great memory was not what it had been, and he had some symptoms of intermittent fever; but on 19th September 1808 he was seized in the street with a fit of apoplexy, and after partially recovering sank on the 25th of that month at the comparatively early age of forty-nine. He was buried in Trinity College, close to the statue of Newton, at the opposite end of the chapel to where rest the remains of Bentley.

His library was divided into two parts, one of which was sold by auction; the other, containing the transcript of the Gale Photius, his books with MS. notes, and some letters from foreign scholars, was bought by Trinity College for 1000 guineas. His note-books were found to contain, in the words of Bishop Blomfield, "a rich treasure of criticism in every branch of classical literature—everything carefully and correctly written and sometimes rewritten—quite fit to meet the public eye, without any diminution or addition." They have been carefully rearranged of late years, and illustrate among other things his extraordinary penmanship and power of minute and accurate writing. Much still remains unpublished, though much has been given to the world. Monk, his successor as Greek professor, and Blomfield (both afterwards bishops) edited the *Adversaria*, consisting of the notes on Athenæus and the Greek poets, and his prelection on Euripides; Dobree,

afterwards Greek professor, the notes on Aristophanes and the lexicon of Photius. Besides these, from other sources, Professor Gaisford edited his notes on Pausanias and Suidas, and Mr Kidd collected his scattered reviews. And, when Bishop Burgess attacked his literary character on the score of his *Letters to Travis*, Professor Turton (afterwards Bishop of Ely) came forward with a vindication.

In claiming for Porson the very high place he has always occupied among Greek scholars, it is with those who went before him that he must be compared, if we would judge fairly of the advances he made in the knowledge of the language. In learning he was superior to Valckenaer, in accuracy to Bentley. It must be remembered that in his day the science of comparative philology had scarcely any existence; even the comparative value of MSS. was scarcely considered in editing an ancient author. With many editors MSS. were treated as of pretty much the same value, whether they were really from the hand of a trustworthy scribe, or what Bentley calls "scrub manuscripts" or "scoundrel copies." Thus, if we are to find fault with Porson's way of editing, it is that he does not make sufficient difference between the MSS. he uses, or point out the relative value of the early copies whether in MS. or print. Thus he collates very minutely Lascaris's edition of the *Medea*, mentioning even misprints in the text, rather from its rarity and costliness than from its intrinsic value. And his wonderful quickness at emendation has sometimes led him into error, which greater investigation into MSS. would have avoided; thus, in his note on Eur., *Phœn.*, 1373, an error, perhaps a misprint (*ke* for *me*), in the first edition of the scholiast on Sophocles has led him into an emendation of *v*. 339 of the *Trachinise* which clearly will not stand. But his most brilliant emendations, such as some of those on Athenæus, on the *Supplices* of Æschylus, or, to take one single instance, that on Eur., *Helen.*, 751 (ὀδὸν "Ἐλέως for ὀδὸν γε; see Maltby's *Thesaurus*, p. 299), are such as convince the reader of their absolute certainty; and this power was possessed by Porson to a degree no one else has ever attained. No doubt his mathematical training had something to do with this; frequently the process may be seen by which the truth has been reached.

A few words are called for on his general character. No one ever more loved truth for its own sake; few have sacrificed more rather than violate their consciences, and this at a time when a high standard in this respect was not common. In spite of his failings, few have had warmer friends; no one more willingly communicated his knowledge and gave help to others; scarcely a book appeared in his time or for some years after his death on the subjects to which he devoted his life without acknowledging assistance from him. And, if it be remembered that his life was a continued struggle against poverty and slight and ill-health, rather than complain that he did little, we should wonder how he accomplished so much.

The chief sources for Porson's life will be found in the memoirs in the *Gentleman's Magazine* for September and October 1808, and other periodicals of the time (mostly reprinted in Barker's *Porsonianæ*, London, 1852); Dr Young's memoir in former editions of the *Encyclopædia Britannica* (reprinted *ibid.* and in his works); Weston's (utterly worthless) *Short Account of the late Mr Richard Porson*, London, 1808, reissued with a new preface and title-page in 1814; Dr Clarke's narrative of his last illness and death, London, 1808 (reprinted in the *Classical Journal*); Kidd's "Imperfect outline of the life of R. P.," prefixed to his collection of the *Tracts and Criticisms*; Beloe's *Seagenarian* (not trustworthy), vol. i., London, 1817; Barker's *Parrania*, vol. ii., London, 1829; Maltby's "Porsonianæ," published by Dyce in the volume of *Recollections of the Table-Talk of Samuel Rogers*, London, 1856; a life in the *Cambridge Essays* for 1857 by H. R. Luard; and a lengthy life by J. S. Watson, London, 1861.

The dates of Porson's published works are as follows: *Notes in Xenophon's Anabasis*, 1786; Appendix to Toup, 1790; *Letters to Travis*, 1790; *Æschylus*, 1795, 1806; *Euripides*, 1797-1802; collation of the Harleian MS. of the *Odyssey*, 1801; *Adversaria* (Monk and Blomfield), 1812; *Tracts and Criticisms* (Kidd), 1815; *Aristophanes* (Dobree), 1820; *Notes in Pausanias* (Gaisford), 1820; *Photii Lexicon* (Dobree), 1822; *Notes in Suidam* (Gaisford), 1824; *Correspondence* (Luard, edited for the Cambridge Antiquarian Society), 1867. Dr Turton's vindication appeared in 1827. (H. R. L.)

PORTA, BACCIO DELLA. See BACCIO DELLA PORTA.

PORTA, GIAMBATTISTA DELLA (c. 1543-1615), natural philosopher, was born of a noble and ancient family at Naples about the year 1543. In early youth he travelled extensively not only in Italy but also in France and Spain, and he had scarcely emerged from boyhood when he published *Magiæ naturalis, sive de miraculis rerum naturalium lib. IV.* (1558), the first draft of his *Magia naturalis*, in twenty books, published in 1569. At an early age he founded in Naples the *Accademia Secretorum Naturæ*, otherwise known as the *Accademia dei Oziosi*, of which the history has been briefly sketched elsewhere (see *ACADEMY*, vol. i. p. 70); and in 1610 he became a member of the *Accademia dei Lincei* at Rome. He died at Naples on 4th February 1615.

The following is a chronological list of the principal writings of this prolific author:—*De miraculis rerum naturalium*, in four books (1558); *De furtivis litterarum notis*, in five books (1563, and frequently afterwards, entitling him to high rank among the early writers on cryptography); *Magia naturalis* (1569, and often re-

printed, also translated into English in 1658, into French, Spanish, and other languages); *Phytognomonia* (1583, a bulky treatise on the physiology of plants as then understood); *De humana physiognomonia*, in six books (1591); *Villa*, in twelve books (1592; an interesting practical treatise on farming, gardening, and arboriculture, based upon his own observations at his country seat near Naples); *De refractione, optices parte*, in nine books (1593); *Pneumatica*, in three books (1601); *De coelesti physiognomonia*, in six books (1601); *Elementa curvilinea* (1601); *De distillatione*, in nine books (1604); *De munitione*, in three books (1608); and *De aeris transmutationibus*, in four books (1609). Porta also wrote several Italian comedies (*Olimpia*, 1589; *La Fantesca*, 1592; *La Trappolaria*, 1597; *I Due Fratelli Rivali*, 1601; *La Sorella*, 1607; *La Chiappinaria*, 1609; *La Carbonaria*, 1628; *La Cintia*, 1628). Among all the above-mentioned works the chief interest attaches to the *Magia naturalis*, in which a strange medley of subjects is discussed, including the reproduction of animals, the transmutation of metals, pyrotechny, domestic economy, statics, hunting, the preparation of perfumes; in book xvii. he describes a number of optical experiments. They include a description of the camera obscura. If, says he, a small aperture is made in the shutter of a dark room, distinct images of all external objects will be depicted on the opposite wall in their true colours; and he further adds that, if a convex lens be fixed in the opening so that the images are received on a surface at the distance of its focal length, the pictures will be rendered so much more distinct that the features of a person standing on the outside of the window may be readily recognized in his inverted image. He applied this instrument to a sort of magic lantern, the representation of eclipses of the sun, and of hunting and other scenes, battles, and other events produced by movable pictures and drawings. He considered the eye as a camera obscura, the pupil as the hole in the window contracting and dilating with different lights, and the crystalline lens as the principal organ of vision, though he seems to have regarded it not as his convex lens but as the tablet on which the images of external objects were formed, the cornea being, no doubt, in his estimation, the part of the eye which formed the picture. After speaking of spectacles and the like, he professed to know a combination of lenses by which "we may contrive to recognize our friends at the distance of several miles, and those of weak sight may read the most minute letters from a distance. It is an invention of great utility, and grounded on optical principles, nor is it at all difficult of execution; but it must be so divulged as not to be understood by the vulgar, and yet be clear to the sharp-sighted." The obscure description which follows does not, however, make it at all probable that he had really anticipated Galileo.

In his *De refractione* Porta treats of binocular vision. He repeats the propositions of Euclid on the dissimilar pictures of a sphere when seen with each eye and when seen with both; and he quotes from Galen on the dissimilarity of the three pictures thus seen. But, maintaining as he does that we can see only with one eye at a time, he denies the accuracy of Euclid's theorem; and, while he admits that the observations of Galen are correct, he endeavours to explain them on other principles. In illustrating Galen's views on the dissimilarity of the three pictures he gives a diagram in which can be recognized not only the principle but the construction of the stereoscope. It contains a view, represented by a circle, of the picture of a solid as seen by the right eye, of the picture of the same solid as seen by the left, and of the combination of these two pictures as seen by both eyes, placed between the first two pictures. These results, as exhibited in three circles, are then explained by copying the passage from Galen, and he requests the observer to repeat the experiments so as to see the three dissimilar pictures when looking at a solid column.

PORT ADELAIDE, South Australia. See vol. i. p. 151.

PORTADOWN, a market-town of Armagh, Ireland, is situated on the river Bann, and on the Great Northern Railway, 25 miles west-south-west of Belfast and 10 north-north-east of Armagh. The Bann, which is connected with the Newry Canal and falls into Lough Neagh about 5 miles north of the town, is navigable for vessels of 90 tons burden. It is crossed at Portadown by a stone bridge of seven arches, originally built in 1764, but since then re-erected. The town consists of a principal street, containing a number of good shops and houses, and with several streets inhabited by the working-classes branching from it at various points. The only public building of importance is the court-house and news-room. The manufacture of linen and cotton is carried on, and there is a considerable trade in pork, grain, and farm produce. The manor in the reign of Charles I. was bestowed on John Obyns, who erected a mansion and a few houses, which were the beginning of the town. A grain-market

was established in 1780. The population in 1871 was 6735, and in 1881 it was 7850.

PORTALIS, JEAN ÉTIENNE MARIE (1745-1807), French jurist and the principal author of the *Code Civil*, which as the *Code Napoléon* has been declared the greatest monument of the reign of the emperor, came of a bourgeois family, and was born at Bausset in Provence on 1st April 1745. He was educated by the Oratorians at their schools in Toulon and Marseilles, and then went to the university of Aix; while a student there he published his first two works, *Observations sur Émile* in 1763 and *Des Préjugés* in 1764. In 1765 he became an avocat at the parlement of Aix, and soon obtained so great a reputation that he was instructed by Choiseul in 1770 to draw up the decree authorizing the marriage of Protestants. From 1778 to 1781 he was one of the four assessors or administrators of Provence, and in 1783 he brought about the countess of Mirabeau's separation from her husband in spite of the impassioned pleading of the great Mirabeau himself. In 1788 he protested on behalf of the avocats of Aix against Loménie de Brienne's May edicts, but in the following year, probably owing to Mirabeau's influence, he was not elected to the States-General. He entirely disapproved of the great changes brought about by the Constituent Assembly; and, after refusing to be one of the royal commission for splitting up Provence into departments, he retired, first to his country house and then to Lyons, and took no further part in politics. In November 1793, after the republic had been proclaimed, he came to Paris, and was thrown into prison, being the brother-in-law of Siméon, who was the leader of the federalists in Provence. He was soon removed through the influence of Barère to a maison de santé, where he remained undisturbed till the fall of Robespierre. On being released he practised as a lawyer in Paris; and in 1795 he was elected by the capital to the Council of Ancients, at once becoming a leader of the moderate party opposed to the directory. His reports, however, were chiefly on questions of law reform, and he commenced the labours which have made his name famous. As a leader of the moderates he was proscribed at the coup d'état of Fructidor, but, unlike Pichegru and Barbé-Marbois, he managed to escape to Switzerland, and did not return till Bonaparte became First Consul. Bonaparte knew his value, and made him a conseiller d'état in 1800, and then charged him, with Tronchet, Bigot de Préameneu, and Jacques de Maleville, to draw up the *Code Civil*. Of this commission he was the most industrious member, and many of the most important titles, notably those on marriage and heirship, are his work. In 1801 he was placed in charge of the department of cultes, or public worship, and in that capacity had the chief share in drawing up the provisions of the Concordat. In 1803 he became a member of the Institute, in 1804 minister of public worship, and in 1805 a knight-grand cross of the Legion of Honour. He soon after became totally blind; and after undergoing an unsuccessful operation he died at Paris on 23d August 1807.

The work of Portalis appears in the *Code Napoléon*, but see also Frederick Portalis's *Documents, rapports, et travaux inédits sur le Code Civil*, 1844, and *Sur le Concordat*, 1845; for his life, see the biography in the edition of his *Œuvres* by F. Portalis, 1823, and René Lavollée, *Portalis, sa vie et ses œuvres*, Paris, 1869.

PORT AU PRINCE (originally L'HÔPITAL, and for brief periods PORT HENRI and PORT RÉPUBLICAIN), the capital of the republic of Hayti (western portion of the island of HAYTI, *q.v.*), lies in 18° 34' N. lat. and 72° 20' W. long. at the apex of the vast triangular bay which strikes inland for about 100 miles between the two great peninsulas of the west coast, and has its upper recesses protected by the beautiful island of Gonaïves (30 miles long by 2 broad). The city (an archbishopric since the

concordat of 1860) is admirably situated on ground that soon begins to rise rapidly towards the hills; and it was originally laid out by the French on a regular plan with streets of good width running north and south and intersected by others at right angles. Everything has been allowed to fall into disorder and disrepair, and to this its public buildings—a state-house, a national bank, a hospital, a lyceum, a custom-house, &c.—form no exception. The national palace remains as the flames of revolution left it in 1869, and the president lives in an ordinary house. The principal church is an “overgrown wooden shed.” Every few years whole quarters of the town are burned down, but the people go on building the same slight wooden houses, with only here and there a more substantial warehouse in brick. The state of the streets is deplorable in the extreme; and, in spite of the old French aqueduct, the water-supply is defective; while the harbour is rapidly being filled by fetid deposits. From June to September the heat is excessive, reaching 95° to 99° in the shade. According to Ad. Ackerman, the average rainfall for the four years 1864-67 was 61·35 inches, distributed over an average of 152 days. The population, mostly Negroes and mulattoes, is estimated at 20,000. Port au Prince was first laid out by M. de la Cuza in 1749. In 1751 and again in 1770 it was destroyed by earthquakes.

See Edgar La Selve (professor in the Port au Prince lyceum), in *Tour du Monde*, 1879, and Spenser St John, *Hayti, or the Black Republic*, 1884.

PORT ELIZABETH, a seaport town of Cape Colony, at the head of an electoral division of the south-eastern province, lies in 33° 55' S. lat. on Algoa Bay, about 7 miles south of the mouth of the Zwartkop river. Built along the base and up the rocky slopes of the hills that rise for a height of 200 feet above the bay, it has rather a bare appearance as seen from the water, but on landing the stranger finds himself in the midst of a prosperous European town with substantial buildings and fine streets. A small and somewhat muddy stream, Baker's River, divides it into two parts, that to the east being mainly occupied by Malay fishermen. The whole length of the place is about 2 miles, and its breadth varies from a quarter to 1 mile. The main street runs up from the harbour, with its large wool and other warehouses, to the market-place, which is adorned with a handsome granite obelisk. Port Elizabeth owes its prosperity to the fact that it has become the great emporium for the whole interior of the country to the south of the Zambesi, being the terminus of the Eastern and Midland Railways which run inland to Graaff Reinet, Cradock (182 miles, since 1880), and Grahamstown (since 1879). The two great hindrances to development have been want of drinking-water and want of protection and convenient landing-places in the harbour. The former has been fully met by an aqueduct (28 miles) from Van Staanden's River (1878; see J. G. Gamble's *Report to Inst. Civ. Eng.*, 1883), and the harbour was improved in 1881 by extending the old landing-pier to a total length of 900 feet and constructing a similar pier 800 feet long. The value of the imports has increased from £376,638 in 1855 to £4,001,658 in 1881 and £2,364,891 in 1883; that of the exports from £584,447 in 1855 to £2,583,737 in 1881 and £2,341,123 in 1883. The exports are mainly wool (£1,508,280 in 1881), ostrich feathers (£131,279), and Angora goat's hair (£257,596), as well as ivory, hides, diamonds. The population, which was not much above 4000 in 1855, reached 13,049 in 1875. The town dates from 1820.

PORTER, JANE (1776-1850), a novelist whose life and reputation are closely linked with those of her sister ANNA MARIA PORTER (1780-1832) and her brother Sir ROBERT KER PORTER (1775-1842). Their father, an

officer in the English army, having died shortly after the birth in 1776 of the younger sister, the mother removed from Durham, their birthplace, to Edinburgh, where the inherited passion for the romance of war which gave character to the works of each appears to have been stimulated by their association with Flora Macdonald and the young Walter Scott. To develop the artistic ability displayed by the brother, the family moved in 1790 to London, and the sisters subsequently resided at Thames Ditton and at Esher with their mother until her death in 1831. The ability of Anna Maria Porter was the first to manifest itself in the premature publication of her *Artless Tales* (1793-95), these being followed by a long series of works, of which the more noteworthy are *Walsh Colville* (1797), *Octavia* (1798), *The Lake of Killarney* (1804), *A Sailor's Friendship and a Soldier's Love* (1805), *The Hungarian Brothers* (1807), *Don Sebastian* (1809), *Ballads, Romances, and other Poems* (1811), *The Recluse of Norway* (1814), *The Knight of St John* (1817), *The Fast of St Magdalen* (1818), *The Village of Mariendorpt* (1821), *Roche Blanche* (1822), *Honor O'Hara* (1826), and *Barony* (1830). Jane Porter, whose intellectual power, though slower in development and in expression, was of a stronger nature than that of her sister, had in the meantime gained an immediate and wide popularity by her first work, *Thaddeus of Warsaw* (1803), which was translated into several languages and procured her election as canoness of the Teutonic order of St Joachim. Seven years later her *Scottish Chiefs* anticipated in some measure the works of Sir Walter Scott in the field of national romance, though it is wanting in the higher qualities of the historic novel. Her chief subsequent works were *The Pastor's Fireside* (1815), *Duke Christian of Lüneburg* (1824), *Coming Out* (1828), and *The Field of Forty Footsteps* (1828). In conjunction with her sister she published in 1826 the *Tales round a Winter Hearth*, and the intervals between her larger works were filled up with frequent contributions to current periodical literature. *Sir Edward Seaward's Diary* (1831)—a work displaying considerable skill in the realistic reproduction of the style and mode of thought of an earlier period—has been persistently, though erroneously, attributed to her. The claim of her eldest brother, Dr William Ogilvie Porter, to its authorship has been fully established, her share in its publication having been solely that of editor. In 1832 Anna Maria died, and for the next ten years Jane became “a wanderer” amongst her relations and friends.

While his sisters had been winning esteem in literature, Robert Ker Porter had in his own way been scarcely less successful. After two years of study at the Royal Academy he had gained reputation as a painter of altar-pieces and battle-scenes of imposing magnitude. He went to Russia as historical painter to the emperor in 1804, accompanied Sir John Moore's expedition in 1808, married the princess Mary de Sherbatoff in 1811, was created knight commander of the order of Hanover in 1832, and became British consul at Venezuela. Accounts of his wanderings are to be found in his *Travelling Sketches in Russia and Sweden* (1808), *Letters from Portugal and Spain* (1809), *Narrative of the late Campaign in Russia* (1813), and *Travels in Georgia, Persia, Armenia, Ancient Babylonia, &c., during the years 1817-20* (1821-22). After leaving Venezuela he again visited St Petersburg, but died there suddenly on 4th May 1842. Jane Porter, who had joined him in Russia, then returned to England and took up her residence with her eldest brother at Bristol, where she died, 24th May 1850.

PORT GLASGOW, a seaport, market-town, burgh of barony, and parliamentary burgh of Renfrewshire, Scotland, is situated on the south side of the Clyde, 2½ miles east of Greenock and 20 west of Glasgow. The elevated ridges to the back of the town are clothed with trees,

their lower slopes being occupied with villas. The streets are wide, regular, and well-paved. The principal buildings are the court-house in the Grecian style, the town-hall, and the custom-house. On the adjoining slopes to the east are the picturesque ruins of Newark Castle, the ancient seat of the Maxwells. There are large and commodious harbours, a wet dock, and a graving dock. The port carries on an extensive trade with British North America, the United States, the Indies, and the Levant, the principal exports being iron, steel, machinery, and textile manufactures. The trade, though checked for a time by the rapid progress of Greenock, has been for some years on the increase. The shipbuilding-yards give employment to a large number of persons both in the town and the neighbouring burgh of Greenock. Connected with the shipbuilding industry there are manufactures of sail-cloth, ropes, anchors, and chain cables, also engineering and riveting works, and iron and brass foundries. The population of the police burgh in 1851 was 6986, which in 1871 had increased to 10,823, and in 1881 to 13,224. The population of the parliamentary burgh in 1881 was 10,802.

Originally the district formed part of the adjoining parish of Kilmalcolm, the nucleus of the town being the small village of Newark attached to the barony of that name. In 1688 it was purchased from Sir Patrick Maxwell of Newark by the magistrates of Glasgow, to provide a convenient harbour for vessels belonging to the city. In 1695 it was disjoined from Kilmalcolm and erected into a separate parish under the name of New Port Glasgow, afterwards Port Glasgow. In 1710 it was made the chief custom-house port for the Clyde, but is now under the control of the Greenock office; and in 1775 it was created a burgh of barony. Under the Municipal Act of 1883 the town is governed by a provost, two bailies, and six councillors. Since the first Reform Act it has been included in the Kilmarnock parliamentary district of burghs.

PORT HOPE, a town and port of entry of Canada, in Durham county, Ontario, on the north shore of Lake Ontario, lies 63 miles north-east of Toronto by the Grand Trunk Railway (which is there met by the midland branch of the Grand Trunk Railway), and is connected with Charlotte, the port of Rochester, New York, by a daily steamboat service. The town is picturesquely situated on the side and at the foot of hills overlooking the lake; and Smith's Creek, by which it is traversed, supplies abundant water-power. Flour, plaster, woollen goods, leather, beer, carriages, agricultural implements, and steam-engines and boilers are among the objects of the local industries, and trade is carried on in lumber, grain, and flour. The value of the exports was \$1,326,706 in the year ending 30th June 1884, and that of the imports \$21,830. The population in 1881 was 5585.

PORT HURON, a city and port of entry of the United States, county seat of St Clair county, Michigan, lies 58 miles by rail north-east of Detroit, at the southern extremity of Lake Huron and on the west bank of the St Clair river, which is there joined by the Black river. Port Huron is a point of great importance in the railway system, being the terminus of the Chicago and Grand Trunk and the Port Huron and North-Western Railways (lines to East Saginaw, Sand Beach, Almont, and Port Austin), and connected by ferry to Sarnia with the Great Western of Canada and the Grand Trunk Railways. It is also the terminus and a stopping-place of several lines of lake steamers. It has a large lumber trade, ship-yards, dry docks, saw-mills, flour-mills, planing-mills. The population was 5973 in 1870, 8883 in 1880, and 10,396 in 1884. Commenced in 1819, Port Huron was incorporated as a village in 1835, and as a city in 1857.

PORTICI, a town of Italy, 5 miles south of Naples, on the shores of the bay and at the foot of Vesuvius, a little to the north of the site of Herculaneum. It is traversed by the high road and the railway from Naples (only 5 miles distant) to Salerno. The palace, erected in 1737,

once contained the Herculanean antiquities, now removed to Naples, and since 1882 it has been a school of agriculture. There is a small harbour. The population (9963 in the town in 1881, and 12,709 in the commune, which includes Addolorata) is partly engaged in the fisheries, silk-growing, and silk-weaving.

PORT JERVIS, a large village of the United States, in Deerpark township, Orange county, New York, situated at the intersection of the boundaries of New Jersey, New York, and Pennsylvania, at the junction of the Neversink with the Delaware. It is the terminus of the eastern division of the New York, Lake Erie, and Western Railroad, and of the Port Jervis and Monticello Railroad, and it has extensive repair-shops. The beauty of the surrounding scenery attracts summer visitors. Port Jervis was named after John B. Jervis, engineer of the Delaware and Hudson Canal, which connects the Pennsylvanian coal-fields with the tidal waters of the Hudson. In 1875 the Erie Railway bridge, the Barrett bridge, and many buildings were carried away by an ice-george. The population of the village was 6377 in 1870, and 8678 in 1880 (township 11,420).

PORTLAND, a city and port of entry of the United States, capital of Cumberland county, Maine, lies on Casco Bay, in 43° 39' N. lat. and 70° 13' W. long. By rail it is 108 miles north-north-east of Boston and 297 south-east of Montreal. The peninsula on which it is mainly built runs out for about 3 miles, has a breadth of about $\frac{1}{4}$ mile, and rises in the west to 175 feet in Bramhall's Hill and in the east to 161 in Munjoy's Hill, which is crowned by an observatory. As seen from the harbour, the whole city has a pleasant and picturesque appearance, and the streets are in many parts so umbrageous with trees that

FIG. 1.—Environs of Portland. Portland has obtained the sobriquet of the "Forest City." A large number of the houses are built of brick. Congress street, the principal thoroughfare, runs along the whole ridge of the peninsula, from the western promenade, which looks down over the suburbs from Bramhall's Hill to the eastern promenade, which commands the bay; it passes Lincoln Park (2½ acres) and the eastern cemetery, which contains the graves of Commodore Preble of Revolutionary fame, and Captains Burroughs and Blythe. On Bramhall's Hill is the reservoir (12,000,000 gallons) of the water company, which was established in 1867 to supply the city from Lake Sebago, whose beautiful expanse (14 miles long by 11 wide) was the favourite haunt of Nathaniel Hawthorne's boyhood. The more conspicuous buildings of Portland are the city hall (1859), with a front in olive-coloured freestone, 150 feet long; the post-office (1872), constructed of Vermont white marble in the mediæval Italian style; the custom-house (1872), in granite, with rich marble ornamentation in the interior; the marine hospital (1855), a large brick erection; the Maine general hospital, 1868; the Roman Catholic cathedral; the Roman Catholic episcopal palace; and several fine churches. The Portland Society of Natural History, established in 1843 and incorporated in 1850, though it has twice lost its property by fire (1854 and 1866), has again acquired very valuable collections. The Portland institute and public library, dating from 1867, had 30,000 volumes in 1884. A medical school was founded in 1858. Portland is in the main a commercial city, with an extensive transit trade, drawing largely from Canada and the Far West. Connected with Boston by rail in 1842, and with Montreal

in 1853, it has now become a terminus of six different railroads; and, since the gauge of the Grand Trunk Railroad was altered, it can import direct from San Francisco. As the harbour (which lies along the south side of the city) is seldom closed by ice, it has been long used as the winter port for the great ocean steamers between Great Britain (Liverpool and Glasgow) and Canada, which in summer ascend the St Lawrence to Montreal and Quebec. At low water vessels drawing 22 feet and at high water vessels drawing 30 feet can come up to the wharves with

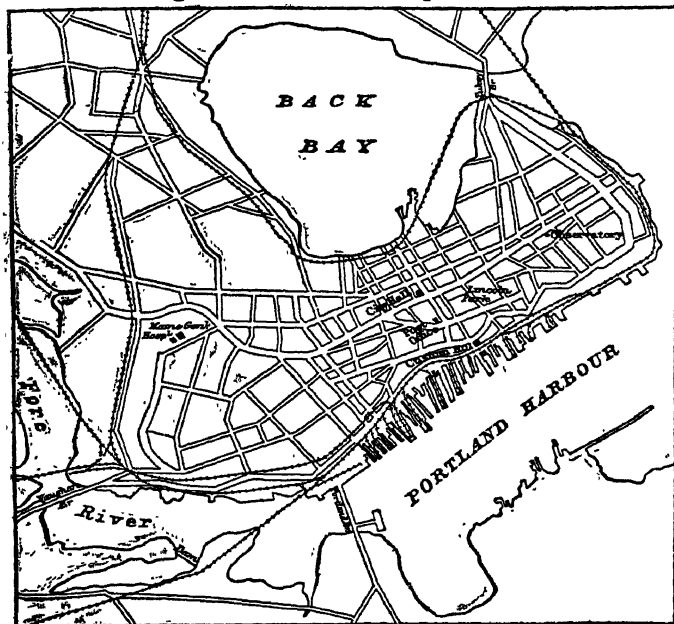

FIG. 2.—Plan of Portland, Me.

safety in any season; and there is secure anchorage within a mile of the shore. The dry dock is one of the deepest in the United States. The following figures show the extent of the foreign trade:—

	Imports.	Exports.
Average 1876-80	\$9,368,044	\$11,044,389
1881	11,078,612	12,476,389
1882	11,748,183	11,955,787
1883	10,235,991	13,847,574

Among the staple imports are wood, coal, potatoes (from Europe), salt, sugar and molasses, fish, earthenware, and textile manufactures; and among the staple exports to foreign countries fresh and preserved provisions of all kinds, grain, hay, cattle, wood, copper ore, tallow, shoes, potash, cotton, lumber (mainly to South America), and ice. In 1870 the total receipts of grain amounted to 1,516,875 bushels, in 1875 to 2,152,829, in 1878 to 4,492,952, and in 1883 to 4,964,158 bushels, or, adding flour, 7,543,873 bushels. The number of entrances from foreign ports in 1883 was 338 (164,711 tons), clearances for foreign ports 501 (226,420 tons); entrances in the coasting trade 479 (403,166 tons), and clearances 389 (394,500 tons). In the same year the Portland-owned vessels numbered 368 (105,642 tons); and 116 were employed in the mackerel and cod fisheries. Fish-curing (cod, mackerel, and sardines), preserving meat, Indian corn, and other kinds of provisions, boot and shoe making, furniture-making, carriage-building, machinery-making, engine-building, and sugar-refining are all prosecuted on a considerable scale for the size of the town; and a large number of minor industries are also represented. In 1884 there were six national banks, with an aggregate capital of \$3,250,000, and two savings banks, with deposits of \$8,966,879. In 1880 the capital invested in manufactur-

ing was \$4,659,375, the value of the annual production \$9,569,523, and the amount of wages paid \$1,547,375. Portland is divided into seven wards, and is governed by a mayor, a board of aldermen, and a common council. It is the seat of the sessions of the United States courts for the district of Maine. The assessed value of property was \$30,723,936 in 1874, and \$33,030,020 in 1883. The population was 3704 in 1800, 20,815 in 1850, 31,413 in 1870, and 33,810 in 1880. If the adjoining villages be included, the total is raised to between 45,000 and 50,000.

The name of Portland as applied to this city dates only from 1786; the Indians knew the place as Machigonne. The first European settlers (1632) called it Casco Neck, and after it passed to Massachusetts in 1658 it was denominated Falmouth. During the rest of the 17th century and the early years of the 18th hostilities on the part of the French and the Indians prevented the growth of the town, which by 1764, however, had increased to about 2000 inhabitants. In 1775 it was bombarded by four British vessels under Captain Mowatt, but it was rebuilt in 1783, and formally incorporated in 1786. A city charter was obtained in 1832. The great fire of 1866 swept over a third of the city and caused a loss of from \$6,000,000 to \$10,000,000. Portland is the birthplace of Henry W. Longfellow, N. P. Willis, Sara P. Parton ("Fanny Fern"), Erastus and James Brooks, Commodore Preble, John Neal, and Neal Dow.

PORTLAND, the largest city of Oregon, in the United States, the capital of Multnomah county and the seat of the United States courts for Oregon, is situated at the head of ship navigation (river craft ascend 126 miles farther) on the west bank of the Willamette, 12 miles above its junction with the Columbia river and about 120 from the ocean. It is a well-built and rapidly-growing city, laid out on a piece of level ground gradually rising from the river bank, and enclosed on the west by a semi-circle of fir-clad hills. Except in the business parts, the streets, which are remarkably well kept, are planted with maple trees; and a park about 200 feet broad runs through nearly the whole length of the city from north to south. Besides the schools, several of which are especially noteworthy, the public buildings comprise a county courthouse, a United States custom-house and post-office, three public halls, three theatres, and spacious markets. In 1883 no less than \$4,039,100 were expended on building enterprises, \$2,000,000 of this sum being for business and manufacturing establishments. Portland is the natural centre of the rapidly developing railway system of Oregon and the neighbouring Territories (see OREGON, vol. xvii. p. 824). It is the terminus of the Oregon Railway and Navigation Company's system, which forms the connecting link with tide water of the Northern Pacific and Union Pacific Railroads, thus making Portland virtually the Pacific coast terminus of these two transcontinental lines. Vessels drawing from 19 to 21 feet of water can load at its wharves, and, though it is still dependent on San Francisco for a large proportion of its foreign supplies, it trades directly with Great Britain, China, the Sandwich Islands, the South-American republics, &c. Wheat, flour, tinned salmon, and lumber are the principal articles of export. In 1883 the value of the exports amounted to \$10,984,963 and that of the imports to \$27,668,787. The manufacturing establishments—foundries, saw-mills, breweries, soap-works, boot and shoe factories, &c.—had in 1883 an aggregate production valued at \$11,423,000, or an increase on the production in 1880 of \$8,521,000. The valuation of property for the purposes of taxation was \$9,622,750 in 1877 and \$19,397,750 in 1883. The population, which was only 2874 in 1860 and 8293 in 1870, had increased by 1880 to 17,577, or, including the suburban city of East Portland, 20,511; and it is estimated that the present (1884) total is about 40,000. A separate district is inhabited by the Chinese, who number several hundreds.

Portland was laid out in 1845, and became a city in 1851. In December 1872 it was visited by a destructive fire, and it had hardly

recovered when, on 2d August 1873, a more disastrous conflagration destroyed about twenty blocks in one of the most crowded parts of the city, and caused a total loss of \$1,345,400.

PORTLAND, ISLE OF, a small island or peninsula of England, in the English Channel, $4\frac{1}{2}$ miles south of Weymouth, Dorsetshire, connected with the mainland by a long narrow ridge of shingle called the Chesil Bank. There is communication with Weymouth both by rail and steamer. The island is $4\frac{1}{2}$ miles long by $1\frac{3}{4}$ broad, the area being 2890 acres. The coast-line is wild and precipitous, and Portland is inaccessible from the sea on all sides except the south. The highest elevation is 490 feet. Numerous caverns have been excavated by the action of the waves, and off Portland Bill, the southern extremity of the island, is a bank called the Shambles, between which and the land there flows a dangerous current called the Race of Portland. The substratum of the island is Kimmeridge clay, above which rest beds of sands and strata of Oolitic limestone, widely famed as a building stone. The extensive quarries have supplied the materials for St Paul's Cathedral and many other important public buildings in London and elsewhere, about 70,000 tons of stone being now exported annually. In the "dirt-bed" resting upon the Oolitic strata numerous specimens of petrified wood are found, some of them of great size. The soil, though shallow, is fertile, and mutton fed on the grass has a peculiarly rich flavour. Agriculture, fishing, and especially quarrying give employment to the inhabitants, who are tall and handsome, and retain some singular customs, among which may be mentioned that of conveying land by "church gift" (see **REAL ESTATE**). By the construction of a break-water $2\frac{1}{4}$ miles in length, the building of which occupied twenty-three years, from 1849 to 1872, a harbour of refuge 2100 acres in extent has been formed, affording a safe and convenient anchorage for a very large fleet of vessels. It is defended by two forts of great strength, mounted with heavy ordnance. A convict prison, erected on Portland in 1848, has cells for 1500 prisoners.

Portland Castle, built by Henry VIII. in 1520, is generally occupied by the commander of the engineers or of the regiment stationed on the island. On the east side of the island are the remains of a more ancient fortress, ascribed to William Rufus. The Isle of Portland is not mentioned in the time of the Romans. In 837 it was the scene of an action against the Danes, and in 1052 it was plundered by Earl Godwine. In 1643 the Parliamentary party made themselves masters of the island and castle, but shortly afterwards these were regained by the Royalists through a clever stratagem, and not recovered again by the forces of the Parliament till 1646. The island is under the government of a local board of health. The population in 1871 was 9907, and in 1881 it was 10,061, including 550 on board vessels, 861 in Verne Citadel barracks, and 1620 in the convict prison.

PORTLAND, WILLIAM BENTINCK, FIRST EARL OF (d. 1709), was descended from an ancient and noble family of Guelderland, and became page of honour to William, prince of Orange, from which he was advanced to be gentleman of the bedchamber. In this capacity he accompanied the prince to England in 1670, and along with him was created doctor of civil law by the university of Oxford. Afterwards he became a colonel in a Dutch regiment of guards. When the prince of Orange was attacked with smallpox he, in accordance with a suggestion of the physicians, volunteered to lie in bed with him, that the heat of his body might check and expel the disease. This remarkable act of self-sacrifice secured him throughout life the special friendship of the prince, and by his prudence and ability, no less than by his devotedness, he fully justified the confidence that was placed in him. In 1677 he was sent by the prince to England to solicit the hand of the princess Mary, eldest daughter of James, then duke of York. At the Revolution he was the chief medium of communication between the prince and the English nobility, and in the delicate negotiations his practical shrewdness

greatly facilitated the arrival at a proper understanding. After superintending the arrangements in connexion with the prince's expedition, he accompanied him to England, and was made groom of the stole, privy purse first gentleman of the royal bedchamber, and first commissioner on the list of privy councillors. On 9th April 1689 he was created Baron Cirencester, Viscount Woodstock, and earl of Portland. With the rank of lieutenant-general he distinguished himself in command of the Dutch cavalry at the battle of the Boyne in 1690, and he was also present at the battle of Landen in 1693, and at the siege of Namur in 1695. Along with marshal de Boufflers he prepared the terms of the peace of Ryswick in 1697, and shortly afterwards was appointed ambassador-extraordinary to Paris. Notwithstanding his diplomatic skill, his grave and cold manner rendered him unpopular with the English nobility, and his brusque honesty caused him to be sometimes wanting in outward respect to the king. Gradually his influence at the court was supplanted by that of the earl of Albemarle, who was more skilled in the arts of popularity; and in 1700, notwithstanding the efforts of the king to soothe his wounded vanity, he resigned his offices and retired to his seat at Bulstrode, Bucks, where he occupied his leisure in gardening and in works of charity. For receiving grants of land in Ireland, and for his share in the partition treaty, he was impeached by parliament, but the prosecution did not succeed. He died 23d November 1709, and was buried in Westminster Abbey.

PORTLAND, WILLIAM HENRY CAVENDISH BENTINCK, THIRD DUKE OF (1738-1809), prime minister of England, was the grandson of Henry, second earl and first duke of Portland, who was son of William, first earl. He was born 14th April 1738, and was educated at Oxford university, where he graduated M.A. in 1757. In 1761 he was elected to represent the borough of Weobly (Hereford) in parliament, but in May of the following year he was called to the Upper House on the death of his father. Under the marquis of Rockingham he was, from July 1765 to July 1766, lord chamberlain, and on the return of the marquis of Rockingham to power in 1782 he was made lord-lieutenant of Ireland. After the short ministry of Shelburne, succeeding the death of Rockingham, the duke of Portland was selected by Fox and North as a "convenient cipher" to become the head of the coalition ministry, to the formation of which the king was with great reluctance compelled to give his assent. The duke held the premiership from 5th April 1783 until the defeat of the Bill for "the just and efficient government of British India" caused his dismissal from office on 17th December. In 1792 he succeeded the earl of Guildford as chancellor of the university of Oxford. Under Pitt he was, from 1794 to 1801, secretary of state for the home department, after which he was, from 1801 to 1805, president of the council. In 1807 he was appointed a second time first lord of the treasury. Ill-health caused him to resign in September 1809, and he died 30th October following. He owed his political influence chiefly to his rank, his mild disposition, and his personal integrity, for his talents were in no sense brilliant, and he was deficient in practical energy as well as in intellectual grasp.

PORT LYTTLETON, a municipal borough of New Zealand, formerly called Port Cooper and Port Victoria, lies on the north-west side of Banks Peninsula, on the east coast of South Island. The town, situated in $43^{\circ} 36' S.$ lat. and $172^{\circ} 44' E.$ long., stands on the north shore of a small bay 4 miles south-west from the heads. A fixed

white light, visible 30 miles in clear weather, is placed on Godley Head on the north-west side of the entrance to the bay. Harbour works, costing over £300,000, have made Port Lyttelton a first-rate commercial port. Protecting breakwaters have created a fine, accessible wet dock of about 110 acres in extent and contiguous to the town; there is ample wharf accommodation for large vessels and every appliance for loading, discharging, and storing cargo. A graving-dock, closed by a caisson, is 450 feet long, 82 feet broad between the copings and 46 feet on the floor, and has a depth of 23 feet of water on the sill. The shipping, excluding coasters, entered inwards at Port Lyttelton during 1883 amounted to 124 vessels of 83,117 tons, and 140 of 120,328 tons cleared outwards. Imports have increased in value from £629,457 during 1872 to £1,400,106 during 1883, and exports from £829,260 to £1,944,035. Port Lyttelton is surrounded by steep hills, and is connected by rail with Christchurch, 7 miles inland. There is steam communication twice a week with the chief ports of New Zealand, and weekly with Melbourne. The population in the census of 1881 was 4127. The town, which is supplied with water and gas, and with electric light lamps on the wharves and the railway bridge, has post and telegraph offices, a time observatory, a jail for long-service prisoners, a state school, a sailors' home, and an orphanage.

PORT MAHON, or MAHON, a city and seaport in the Mediterranean, on the east coast of the Spanish island of Minorca (see BALEARIC ISLANDS), lies on a height near the head of an inlet of the sea $3\frac{1}{2}$ miles long by from 400 to 1200 yards wide, which, though of less importance than formerly, is still an admirable harbour of refuge. The city presents a fine appearance from the sea, and is solidly built of excellent stone, but contains few features of interest. Many of the houses bear the stamp of the English occupation, which has also left curious traces in the life of the people. Shoemaking is the principal trade, and shoes and the building stone already mentioned are the only important exports. The population was 21,976 in 1860, and 15,842 in 1877. At Cala Figuera (a cove to the south-east of the town) is a cotton-factory; the King's Island (I. del Rey, so called as the landing-place of Alphonso III. of Aragon in 1287) contains a hospital built by the admiral of the English squadron in 1722; farther south-east on the shore lies the village of Villa Carlos or George Town (1746 inhabitants in 1877), with ruins of extensive English barracks; and at the mouth of the port, on the same side, are the remains of Fort San Felipe, which was originally erected by Charles V. and twice became the scene of the capitulation of British troops. Opposite San Felipe is the easily-defended peninsula of La Mola (256 feet high), which is occupied by extensive Spanish fortifications now in course of completion. Mahon is one of the principal quarantine stations of Spain; the hospital, erected between 1798 and 1803, stands on a long tongue of land, separated from La Mola by Cala Taulera.

Mahon is the ancient Portus Magonis, which under the Romans was a municipium (*Mun. Flavium Magonianum*), probably including under its authority the whole island. As the name suggests, it had previously been a Carthaginian settlement. The Moors had for some time been in possession when they were expelled by Don Jayme of Aragon in 1282. Barbarossa of Algiers besieged and captured the city in 1535; and in 1558 it was sacked by a corsair called Piali. The English, who under James Stanhope, afterwards Earl Stanhope, seized the island in 1708, made Mahon a flourishing city, and in 1718 declared it a free port. In the year 1756 it fell into the hands of the French, through the failure of the unfortunate Admiral Byng to relieve the garrison of St Philip's (San Felipe). Restored to the English in 1762, it was in 1782 heroically but unsuccessfully defended by General Murray. In 1802 it was finally ceded to Spain by the treaty of Amiens.

PORTO ALEGRE, a city and seaport of Brazil, the capital of the province of Rio Grande do Sul, lies in 30° 2'

S. lat. and 51° 12' W. long, at the northern extremity of the Lagõa dos Patos (Duck Lagoon), where it receives the waters of the Jacuhi, Sino, Cahi, and Gravatahi, whose confluence opposite the city is sometimes distinguished by the name of Lagõa Viamão. Like the other towns on this lagoon, Rio Grande do Sul and Pelotas, Porto Alegre is the seat of a very considerable trade, but it is impossible to say precisely what share belongs to each of the three. (See RIO GRANDE DO SUL.) Its harbour is accessible to vessels drawing 10 to 12 feet; it is the terminus of a railway running by São Leopoldo to Neuhamburg; and it serves as a centre for the various German colonies in the province. A cathedral, a seminary, a lyceum, a provincial library, government offices, a theatre, a large hospital, and a market-house are among the public buildings. The population is about 25,000.

Porto Alegre was founded in 1743 by immigrants from the Azores, and was at first known as Porto dos Cazaes. In 1770 it was chosen by José Marcellino de Figueiredo as his residence and obtained its present name. Three years later it had 5000 inhabitants. The title of "town" with the full name São José de Porto Alegre was bestowed in 1808, and in 1812 São José became the governor's residence for the comarca, which till 1821 comprised both Rio Grande do Sul and Santa Catharina. In 1822 it was raised to the rank of a city, and in 1841, as a reward for its loyalty, was distinguished with the epithets "leal y valorosa."

PORTO BELLO (Span., *Puerto Bello*), a town in the republic of Colombia and state of Panamá, situated on the coast of the Caribbean Sea, about 23 miles east of Colon in 9° 32' N. lat. and 78° 38' W. long. As the name (bestowed by Columbus in 1502) implies, it possesses a fine natural harbour, the bay between Drake's Point in the north and Buenaventura Island in the south being easy of entrance and having a depth of 8 to 16 fathoms. Founded in 1584, the city rapidly grew in importance, becoming the great depôt for the gold and silver from Peru, which were brought across the isthmus from Panamá, and here conveyed on board the royal galleons. It is now best remembered through the unexpected success which attended Admiral Vernon's attack in 1739. "Within forty-eight hours after his appearance in the harbour" he was in possession of the place, and before he left he utterly destroyed the fortifications. At that time the city contained about 10,000 inhabitants; it now barely numbers 1000, including the Negroes, who live in the quarter known as Guinea. A few public buildings, such as the principal church and the treasury, remain as indications of former prosperity. The decline is due much less to Admiral Vernon than to the extreme unhealthiness of the situation, and the fact that trade has taken to quite other channels.

PORTOBELLO, a municipal burgh of Scotland, in the county of Midlothian, lies on slightly sloping ground on the south shore of the Firth of Forth, 3 miles by rail east of Edinburgh. At the west end are extensive brickfields, two potteries (working English clay), two bottle-works, and a paper-mill. Southwards and eastwards the houses are those of a residential suburb of Edinburgh and a summer watering-place. Among the more conspicuous edifices are the new municipal buildings (1878), the old town-hall (1863), a United Presbyterian church (1880), the Free-church (1876-77), the Episcopal church (1826), and the School Board schools (1876). Portobello beach is a fine reach of firm clean sands, but these have been to some extent spoiled by the vicinity of manufacturing works and sewage outlets. A marine parade was constructed in 1860 and a promenade pier (1250 feet long) in 1871. The population was 5481 in 1871 and 6794 in 1881. What used to be the separate village of Joppa is now included in Portobello.

Portobello occupies part of a formerly desolate piece of ground known as the Figgate Whins. The first house was built by a sailor who had served under Admiral Vernon at the capture of Porto Bello in Central America in 1739; but the real beginning of the town dates from the discovery in 1765 of a bed of clay and the consequent

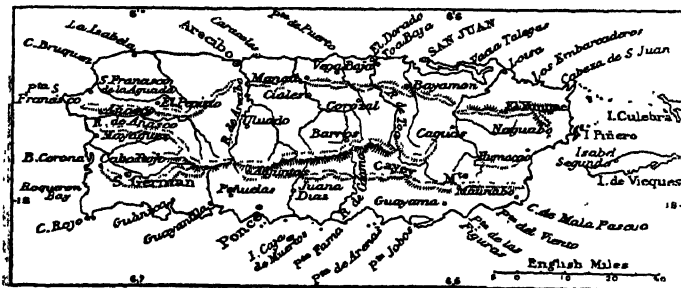

erection of brick and tile works. It was made a burgh by the Reform Act of 1832-33.

PORT OF SPAIN. See TRINIDAD.

PORTO MAURIZIO, a city of Italy, chief town of a province and centre of a maritime district, lies on the coast of the Ligurian Sea, 46 miles by rail east of Nice and 70 miles west of Genoa, and consists of a picturesque old town situated on the heights and a modern town of villas on the lower slopes. The principal church, designed by Gaetano Cantone, is perhaps the most notable building of its class in the whole Riviera; the roof is divided into arches, domes, and semi-domes resting on massive piers. A few remains of the old city walls may still be seen. In 1881 the population of the city was 6309 and of the commune 6827. About 2 miles east of Porto Maurizio is the town of Oneglia, with a fine church, S. Giovanni Battista, designed by Gaetano Amoretti, a hospital (1785), and a national penitentiary on the cell-system. Its population in 1881 was 7286, that of the commune 7433. Both Porto Maurizio and Oneglia lie on the same bay, and schemes are under discussion for uniting their harbours into one great port. At Porto Maurizio an extension is being made (1884) in the western mole. The foreign traffic of the two ports was represented in 1883 by 154 sailing vessels and 27 steamers entering or clearing (the steamers all preferring Porto Maurizio), and the coasting trade by 627 vessels. Both towns are embowered amid olive groves, and the district is famous for the quality of its oil.

Porto Maurizio appears as *Portus Mauricii* in the Antonine Itinerary. After being subject to the marquises of Susa (11th century), of Savona (12th century), and of Clavesana, it was sold by Boniface of Clavesana in 1288 to Genoa for a yearly pension; in 1354 it became the seat of the Genoese vicar of the western Riviera, and remained in the possession of the republic till it was merged in the kingdom of Sardinia. Oneglia, formerly situated inland at the place called Castelveccchio (Old Castle), has occupied its present site from about 985. The bishops of Albenga sold it in 1298 to the Dorias of Genoa, who in their turn disposed of it in 1576 to Emanuel Philibert. In the various wars of the house of Savoy Oneglia often changed hands. In 1614 and 1649 the Spaniards and in 1623 and 1672 the Genoese obtained possession; in 1692 it had to repulse an attack by a French squadron; in 1744-45 it was again occupied by the Spaniards, and in 1792 bombarded and burned by the French. Pellegrino Amoretti, assistant secretary to Charles V., and Andrea Doria, the famous admiral, were natives of Oneglia.

PORTO RICO (Span., *Puerto Rico*), one of the Spanish West India Islands, lies 70 miles east of Hayti between 17° 50' and 18° 30' N. lat. and 65° 35' and 67° 10' W. long. It forms an irregular parallelogram, 108 miles long and 37 broad, and has an area of 3530 square miles, or rather less than that of Jamaica. From east to west it is traversed by a range of hills so situated that the streams flowing northward are much longer than those flowing

Porto Rico.

south. The highest district, however, and the highest peak—El Yunque (3600 feet)—are situated in the Sierra de Loquillo near the north-east corner. As the hills intercept the north-east trade-winds with their rain-clouds there is sometimes almost a superabundance of moisture in the northern lowlands, while in the south severe droughts occur and the land demands artificial irrigation, as yet carried

out with too little co-operation and system. The island is, however, exceptionally well watered, 1300 streams being enumerated, of which forty-seven are considerable rivers; and its general appearance is very beautiful. Forests still cover all the higher parts of the hills, and differ from those of the other West Indian Islands mainly in the comparative absence of epiphytes. Among the noteworthy trees Baron Eggers (see *Nature*, 6th December 1883) mentions the *Coccoloba macrophylla*, or "ortegon" of the natives, which forms extensive woods in some places, chiefly near the coast, and is conspicuous by its immense yard-long purple spikes; a beautiful *Talauma*, with white odorous flowers, and yielding a timber called "sabino"; an unknown tree with purple flowers like those of *Scaevola Plumieri*; a large *Heliconia*; and several tree-ferns (*Cyathea Serra* and an *Alsophila*). Besides the two staples—sugar and coffee—tobacco, cotton, rice, maize, *Caladium esculentum*, yams, and plantains, as well as oranges, cocoa-nuts, and other tropical fruits, are commonly cultivated. The rice, which is the principal food of the labourers, is a mountain variety grown without flooding. On the lowland pastures, covered mainly with *Hymenachne striatum*, large herds of excellent cattle are reared to supply butcher-meat for St Thomas, the French islands, &c. In general Porto Rico may be described as extremely fertile, and its exports more than double in value those of Jamaica. In 1883 the principal items were—sugar and molasses, 78,482 tons, valued at £1,036,595; coffee, 16,801 tons, at £955,948; honey, 30,378 tons, at £148,148; and tobacco, 1730 tons, at £114,614. Of the tobacco a large proportion is sent to Havana to be manufactured into cigars. The total value of exports and imports has increased from £2,219,870 in 1850 to £5,118,712 in 1883. The great want of the island is still roads and bridges, though the Government has done good work in this department in recent years; the journey across the hills can only be performed on horseback, and even along the coast-route wheeled traffic is at times interrupted. Gold, iron, copper, coal, and salt are all found in Porto Rico, but the last alone is worked.

The island, which was declared a province of Spain in 1870, is divided into the following seven departments:—*Bayamon*, near the north-east end of the island (containing the capital, San Juan Bautista, and Toa-Alta, Toa-Baja, Naranjito, Vega-Alta, &c.), *Arecibo* (Arecibo, Hatillo, Camuy, Quebradillas, &c.), *Aguadilla* (Aguadilla, Moca, Aguada Lares or San Sebastian), *Mayaguez* (Mayaguez, Ahaico, San German), *Ponce* (Ponce, Guayanilla, Peñuelas, Coamo), *Humacao* (Humacao, Naguabo, Luquillo), *Guayama* (Hato-Grande, Gurabo, &c.). And the island of Vieques (with the town of Isabel Segunda) is attached as an eighth department, and used as a military penal station. The total population of Porto Rico was not more than 319,000 in 1830; by 1860 it reached 583,308; and by 1880 754,313. At this last date 429,473 (219,418 males and 210,055 females) were white and 324,840 (162,352 males and 162,488 females) coloured. There is still plenty of room for further expansion. Among the people of European origin are Spaniards, Germans, Swedes, Danes, Russians, Frenchmen, Chuetas or descendants of Moorish Jews from Majorca, and natives of the Canary Islands. There are also a number of Chinese. The Gibaros or small land-holders and day-labourers of the country districts are a curious old Spanish stock largely modified by Indian blood. Till 1856 it was believed that no trace of the original inhabitants of the island remained; archaeological collections, however, have since been made and are now preserved in the Smithsonian Institution, the Ethnological Museum in Berlin, and elsewhere. They comprise stone axes, spear-heads, and knives, stone and clay images, and fragments of earthenware. At Gurabo, on the banks of the Rio Grande de Loiza, there is a curious rude stone monument, on the upper surface of which appear several strange designs (see L. Krug, "Ind. Alterth. in Porto Rico," in *Z. für Ethn.*, Berlin, 1876).

Principal Towns.—San Juan Bautista or St John's (24,000 inhabitants in town and district), the capital, lies in 18° 29' N. and 66° 7' W. on the north coast, on a small island (Morro) connected with the mainland by bridges. It is a place of some strength and contains a governor's palace in the old fort of Santa Catalina, a palace erected by Ponce de Leon, a cathedral, a town-house, a theatre, &c. The harbour is one of the best in the West Indies, having a comparatively unobstructed entrance, and along the wharves a depth

at low water of 10 to 13 feet, and at high water 11½ to 14½. Ponce (38,000 inhabitants in town and district) lies about 3 miles inland from the south coast. Its public buildings are frequently of brick or stone, but the private houses are of wood. It contains a town-hall (situated, like the principal church, in the main square), a public hospital (1875), and an English Episcopal church, and it is lighted with gas by an English company. Mayaguez (27,000 inhabitants in town and district), on the west coast, is also situated several miles inland, and is separated from its port by a river. An iron bridge, however, was constructed about 1875-76. The town has military barracks, clubs, and gasworks. The harbour, accessible only to vessels drawing less than 16 feet, is silting up, as indeed is the case with almost all the harbours of Porto Rico. Other towns are Guayama on the south coast, with its harbour at Arroya, and San Carlos de Aguadilla on the west coast. The seaports are St John's, Ponce, Mayaguez, Naguabo, Fajardo, Aguadilla, and Viequez.

History.—Porto Rico, the Borinquen of the aborigines, was discovered by Columbus in November 1493. In 1510 Ponce de Leon founded the town of Caparra, soon after abandoned, and now known as Puerto Viejo, and in 1511, with more success, the city of San Juan Bautista. The native inhabitants—probably not very numerous, though, with their usual exaggeration, old chroniclers rate them at 600,000—were soon subdued and swept away.¹ In 1595 the capital was sacked by Drake, and in 1598 by the earl of Cumberland. In 1615 Baldwin Heinrich, a Dutchman, lost his life in an attack on the Castillo del Mono. The attempt of the English in 1678 was equally unsuccessful, and Abercromby in 1797 had to retire after a three days' siege. In 1820 a movement was made towards a declaration of independence on the part of the Porto Ricans, but Spanish supremacy was completely re-established by 1823. The last traces of slavery were abolished in 1873 by the abrogation of the system of forced labour.

See Antonio de Herrera, "Descripción de la isla de Puerto Rico, 1582," in *Boletín de la Soc. Geogr. de Madrid*, 1876; Bello y Espinosa, "Geschichte, geogr., und stat. Bemerk. über Puerto Rico," in *Zeitschr. für Ethnologie*, 1872; Inigo Abbad, *Historia . . . de la Isla de S. J. B. de Puerto Rico*, Madrid, 1788, re-published by José Julian Acosta of Porto Rico.

PORT ROYAL, a town and naval station of Jamaica, occupies the outer end of a narrow strip of land called the "Palisades," which, projecting westward for about 9 miles, forms the natural breakwater of the noble bay on which Kingston, the present capital of the island, is built. As a town Port Royal (though in the 17th century it was reputed the finest in the West Indies) is now a wretched place of 1205 inhabitants (1881), with narrow and extremely dirty streets, and contains no buildings of note except a hospital (200 patients) and the spacious admiralty house, which is surrounded by beautiful gardens; but as a naval station it is still of very considerable importance, has well-equipped machine-shops, and is defended by a number of forts and batteries partly of quite modern erection.

The first great blow struck at the prosperity of Port Royal was the earthquake of 1692, which swallowed up whole streets and forts and sunk a considerable part of the site into the sea, where remains of buildings are still visible under water in clear weather. In 1708 the whole town, except the royal forts and magazines, was reduced to ashes; on 22d August 1722 most of the houses were swept into the sea by a hurricane; in 1815 another conflagration proved nearly as destructive as the first; and in 1880 another hurricane did grievous damage.

PORT ROYAL, a celebrated Cistercian abbey, occupied a low and marshy site in the thickly-wooded valley of the Yvette, at what is now known as Les Hameaux near Marly, about 8 miles to the south-west of Versailles. It was founded in 1204 by Mathilde de Garlande, wife of Matthieu de Montmorenci-Marly, during his absence on the fourth crusade, and in its early years it received a variety of papal privileges, including (1223) that of affording a retreat to lay persons who desired to withdraw from the world for a season without binding themselves by permanent vows. Apart from the famous reforms begun here in 1608 by Jacqueline Marie ARNAULD (*q.v.*), the Mère Angélique, the history of Port Royal presents little of general interest until about ten years after the establishment (1626) of the sister house in Paris, when the community fully came under the influence of Duvergier de Hauranne (see vol. vii. p. 567), abbé of St Cyran, the friend of Jansen, and leader

of the anti-Jesuit movement in France. The religious views of St Cyran spread rapidly in Port Royal de Paris, and among the members and connexions of the Arnauld family; and it was under his influence that in 1637 Antoine Le Maître (1608-1658), a nephew of the Mère Angélique, resolved to abandon his brilliant prospects as an advocate and seek a life of ascetic retirement. He found a lodging for himself at Port Royal des Champs (as the mother house came to be called for distinction's sake), which since the departure of the nuns in 1626 had been untenanted. In the following year he was joined in his religious retreat by his younger brothers Simon de Sérincourt (1611-1658), who had served in the army, and Louis Isaac (1613-1684), better known in the world of letters by his assumed name of De Sacy. They were at various times joined by others until in 1646 the "solitaries of Port Royal," apart from merely occasional visitors, had risen to the number of twelve. From almost the beginning of his sojourn Le Maître, carrying out the ideas of his imprisoned master St Cyran, devoted a considerable part of his time to teaching; the number of pupils and also of teachers gradually increased until in 1646 and following years the "Petites Écoles," as they were modestly called, around Port Royal les Champs and in Paris, although destined to be short-lived, attained a great and widespread success (compare vol. vii. p. 675). Of the regular teaching staff probably the most distinguished were Claude Lancelot (1615-1695)² and Pierre NICOLE (*q.v.*); of the pupils it is enough to mention TILLEMONT (*q.v.*) and RACINE (*q.v.*). In 1648 the Mère Angélique with some of the nuns returned from Paris to Port Royal des Champs, which in the interval had been considerably enlarged, while the neighbourhood had been rendered more salubrious by the labours of the solitaries, who now removed to the farmhouse of Les Granges on the height above. In the same year Antoine ARNAULD (*q.v.*), the apologist of the *Augustinus*, came into residence, and thenceforward the "gentlemen of Port Royal" became closely identified in the public mind with the Jansenist cause. The open struggle, which began with the publication in 1653 of the bull of Pope Innocent X. condemning the five propositions (see JANSENISM), came to a disastrous crisis in 1656, when Arnauld was expelled the Sorbonne, and he, as well as Sacy, Fontaine, and Nicole, had to go into hiding. The publication of the *Provincial Letters* in the course of the same year did not tend to soothe the Jesuits, but the timely "miracle of the Holy Thorn" (24th May 1656; see vol. xviii. p. 335) helped to postpone somewhat the evil days that were coming on the Port Royalists. But only for a time; for in 1661 the young and ardently orthodox Louis XIV. caused the Petites Écoles to be broken up and the postulants and novices of the two religious houses to be dispersed. For continued contumacy both houses were in 1664 laid under interdict, which was only removed when the "peace of the church" was established by Clement IX. in 1669. In the same year, however, Port Royal de Paris was separated from the parent house with a grant of one-third of the revenues, and placed under Jesuit management. The nuns of the abbey of Port Royal des Champs were allowed to take in children as pupils, but not to receive any accessions to their own number, and the Petites Écoles were not resumed. The "peace," such as it was, was again destroyed by the bull of Clement XI. in 1705, and in 1708, the nuns proving inflexible, a papal bull was granted for the final suppression of Port Royal des Champs and the transference of the whole property to Port Royal de Paris. The dispersion of the aged sisters took place in the following year; the

¹ A detailed account of their manners, translated from Abbad by Mr Bidwell, will be found in the *Consular Reports*, 1880.

² Author of *Nouvelle Méthode pour apprendre la Langue Grecque* (1655), *Nouvelle Méthode pour apprendre la Langue Latine* (1656), *Grammaire générale et raisonnée* (1660), and other educational works.

buildings were levelled with the ground in 1710; and in 1711 the bodies (to the number, it is said, of nearly 3000) that lay buried within the desecrated precincts were disinterred and removed to other places. Port Royal de Paris continued to subsist in obscurity until 1790.

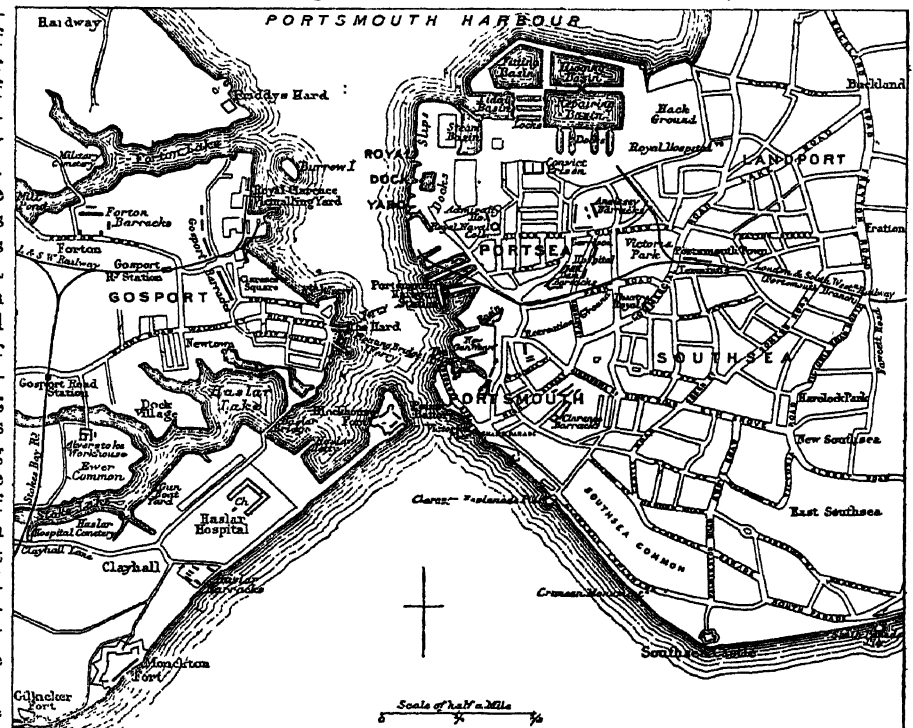

See Sainte-Beuve, *Port Royal* (3 vols., 1842-43; 4th ed., 6 vols., 1878), an exhaustive work, by which all the earlier histories have been superseded.

PORT SAID, a town and seaport of Lower Egypt, which owes its existence to the Suez Canal (1859-69), and was named after Saïd Pasha, patron of the enterprise. It lies on the west side of the canal, on the low narrow, treeless, and desolate strip of land which separates the Mediterranean from Lake Menzaleh (see plate XXXVI., vol. iv.); the supply of fresh water brought from the sweet-water canal at Ismailia by a conduit is barely sufficient for the wants of the town, which is regularly laid out and has some streets of substantial houses. The population rose from 12,332 in 1880 to 16,560 in 1882. Nearly half of this number reside in a miserable native suburb about 500 yards to the west of the town proper. The British subjects (405) are nearly all Maltese. Port Said, having no direct means of communication with the interior, is essentially a coaling station for steamers, and is entirely dependent on the canal trade. The steamers from Alexandria to the Syrian ports call here, and there is a daily steamboat to Ismailia. The outer harbour is formed by the terminal piers of the canal, and the inner harbour comprises three sheltered basins,—the commercial dock, the arsenal dock, and the Sherif dock. The third is flanked by buildings originally erected by Prince Henry of the Netherlands as a *depôt* for Dutch trade. Besides a Catholic and a Greek church, the town contains a hospital and five schools, one of which is maintained by the Capuchin friars, and another by the freemasons.

PORT ST MARY. See **PUERTO DE SANTA MARIA**.

PORTSMOUTH, a municipal and parliamentary borough, seaport, and naval station of Hampshire, England, consists of an aggregate of towns situated in the south-western corner of Portsea Island, opposite the Isle of Wight, 18 miles south by east of Southampton and 74 south-west of London by the London and South-Western Railway. For the general position of Portsmouth, see plate VII. vol. xi. The original town is not now nearly so populous as the suburbs comprised in the general name of Portsea (including Portsea proper) on the north and west, Landport on the north, and Southsea on the east. Portsmouth proper is the barrack and garrison town; at Portsea is situated the great naval dockyard; Landport is occupied chiefly by the houses of artisans; and Southsea, as possessing facilities for bathing, is resided in by the wealthier classes. The old High Street of Portsmouth, which is now continuous with the Commercial Road from the Landport side, forms a spacious and busy central thoroughfare 2 miles in length, with numerous fine buildings, including the new and old post-office, the new offices of the Waterworks Company and Gas Company, the Central or Town Railway station, the new Government House with its pleasure-grounds, the quaint old building occupied by the new free library, and the grammar-school, which was founded in 1732, though the new building was opened in 1879. Since the demolition of the ancient

ramparts and unwholesome moats a few years ago there have sprung up a handsome people's park and recreation grounds for the naval and military forces, and improvements are still being vigorously carried forward. Much of the Government work has been done by convict labour, notably at the north-east of Landport, where 1300 convicts have been engaged in the formation of a new island (Whale Island), on which gunnery experiments are carried out in connexion with the training-ships of the gunnery school. The towns constitute one of the strongest fortresses of the kingdom, being protected by a chain of detached forts, the outer line of which on the land side north of the harbour extends along the Portsdown Ridge, the inner line protecting the approach by Stokes Bay and Gosport on the west side, while eastwards are the Hilsea lines, within which are also the Royal Artillery and cavalry barracks of Hilsea and the powder-magazine of Tipner. On the south side the forts are built in the sea, each being provided with an Artesian well sunk into the seabed, from which a plentiful supply of fresh water can at all times be obtained. The coast to the eastward is lined by the forts of "Cumberland" and "Southsea Castle," which complete the circle. There are 8 barracks—5 in Portsmouth, 1 in Southsea, and 2 in Portsea—and at Eastney are the extensive buildings which constitute the headquarters of the Royal Marine Artillery; on the Gosport side of the harbour are those of the Portsmouth division of the Royal Marines. In the church of St Thomas a Becket (12th cent.) the chancel and transepts form part of the original structure; the nave and tower were erected in 1698. The garrison chapel near the grand parade, in the Early English style, formed originally a portion of the hospital of St Nicholas (1212), and was restored in 1866. Among more recent buildings may be mentioned the new jail and county lunatic asylum, both situated on the outskirts. In the centre of the town and adjoining the people's park are the new cathedral and buildings of the Roman Catholic schools, the new Pres-

Plan of Portsmouth, England.

byterian church, the seamen and marines orphan schools, the offices of the board of guardians and the borough overseers. At Portsea a new railway station has been

built on piles driven into the harbour bed. Besides these, amongst other public buildings may be mentioned the town-hall, the county court, and the theatre. At Portsea is Aria College, opened in 1874 for the training of Jewish ministers. In the same town is situated the convict prison, which superseded the hulks in 1852. Landport has a freemasons' hall (1879-80), and a people's park of eight acres opened in 1878. Southsea, which is only of recent origin, possesses assembly-rooms and baths, a pier (1879), and a fine esplanade 2 miles in length. Southsea Castle, built by Henry VIII., was taken by the Parliamentary forces in 1642 and partly dismantled, but it has now been refortified. The creek which formerly separated Portsmouth and Portsea was filled up in 1876.

The port of Portsmouth extends eastwards 9 miles to Emsworth, and westwards 5 miles to Hill Head at the entrance to Southampton Water. About 3 miles to the south of the harbour is the well-known anchorage of Spithead, protected by the Isle of Wight. The harbour, one of the best in the kingdom, stretches 4 miles inwards to the north-west of the town, with an entrance 220 yards in breadth, permitting access to vessels of the largest tonnage at low tide. There is an anchorage within the basin at low tide of 380 acres, and a portion of the harbour is permanently occupied by dismantled vessels and the reserved fleet of the navy. There is a graving-dock built by the corporation, with 18 feet of water on the blocks, and a patent slip. Extending along the eastern shore are the ordnance gun wharf between Portsmouth and Portsea and to the north of it the great naval Government dockyard, which has lately been much enlarged (see DOCKYARD, vol. vii. 313). At Gosport (*q.v.*) are the royal Clarence victualling yard and the Haslar hospital. Portsmouth has a considerable trade in coal, timber, fruits, and agricultural produce. In 1883 the total number of vessels that entered the port from British and foreign possessions and coastwise was 2094 of 210,210 tons burden, the number that cleared 2079 of 216,926 tons. The borough of Portsmouth is governed by a mayor, fourteen aldermen, and forty-two councillors. The area of the borough is 4320 acres, with a population in 1871 of 113,569, and in 1881 of 127,989. Of the latter number 120,022 were included in Portsea.

To the north of Portsmouth harbour is Porchester Castle, a ruined Norman fortress occupying the site of the *Portus Magnus* of the Romans. The *Saxon Chronicle* mentions the arrival of Port and his two sons on the coast in 501, but the derivation of the name Portsmouth is too evident to require a mythical invention to explain it. Portsmouth, though a small town soon after the Norman invasion, did not possess a church till 1140. It received its first charter from Richard I. In the beginning of the 13th century it had grown to be a naval station of some importance, and for the accommodation of the king's galleys the docks were enclosed by a strong wall. A large portion of the town was burned by the French in 1372. Great additions were made to the fortifications by Edward IV., and the works were continued by later sovereigns, especially Elizabeth and James II. Its importance as a naval dockyard commences about 1544. The English fleet assembled at Portsmouth in 1545 before the naval engagement with the French off Spithead. In 1628 Villiers, duke of Buckingham, when on the point of embarking at Portsmouth with the army for the relief of Rochelle, was killed by Felton. The town was taken by the Parliamentary forces in 1642. In 1662 the nuptials of Charles II. with Catherine of Braganza were celebrated at Portsmouth in the chapel of the garrison. In 1782 the "Royal George," with Admiral Kempenfeldt on board, having been careened to stop a leak, went down in the harbour. About 1792 Portsea began to be built on the common to the north of the town. Among eminent persons connected with the town mention may be made of Charles Dickens, Jonas Hanway, Sir Isambard Brunel, Sir F. Malden.

Allen, *History of Portsmouth*, 1817; Saunders, *Annals of Portsmouth*, 1878.

PORTSMOUTH, a city and port of entry of the United States, one of the two shire-towns of Rockingham county, New Hampshire, and alternately with Concord the seat of the sessions of the United States courts for the district of New Hampshire, lies on a peninsula on the right bank

of the Piscataqua, 3 miles from its mouth, in 43° 4' N. lat. and 70° 45' W. long. By rail it is 57 miles north-east of Boston. Quiet and old-fashioned beyond most of the New England cities, with shaded streets and many quaint antique houses, survivals from colonial times, Portsmouth is a favourite summer resort. Notwithstanding the excellence of its harbour—which is from 35 to 75 feet deep, safe, free from ice at all seasons, and capable of containing 2000 vessels—it has very little foreign trade. There are cotton-mills (Kearsarge), breweries, boot and shoe factories, and some other industrial establishments in the city; and shipbuilding, which is the principal industry, has long been extensively prosecuted. The United States navy yard, though situated on Continental or Navy Island, on the north side of the river, in the township of Kittery (Maine), is generally known as Portsmouth yard. It contains a fine balance dry dock, 350 feet by 105. Among the more conspicuous buildings in Portsmouth are the old church of St John, the Athenæum (15,000 volumes), and the custom-house. There is a public library of 8000 volumes. At Little Harbour, 2 miles distant, is Governor Wentworth's mansion, dating from 1750. The entrance to the harbour is defended by earthworks at Jaffrey's Point and Gerrish's Island. The population was 9738 in 1850, 9211 in 1870, and 9690 in 1880.

Settled in 1623 under the Laconia Company, Strawberry Bank (as it was first called) was named Portsmouth in 1653, and incorporated as a city in 1849. It was the capital of the colony and State of New Hampshire till 1807, when that rank was bestowed on Concord. The "Ranger," afterwards commanded by Paul Jones, and the first ship to carry the stars and stripes, was built at Portsmouth for the American Congress in 1777. The *New Hampshire Gazette*, started at Portsmouth in 1756, is the oldest of all the existing newspapers of the United States, and the *Portsmouth Journal*, established in 1793, is also still published. T. B. Aldrich, J. T. Fields, Eliza B. Lee, and B. P. Shillaber ("Mrs Partington") are natives of the city.

PORTSMOUTH, a city of the United States, capital of Scioto county, Ohio, lies at the confluence of the Scioto with the Ohio, and is the southern terminus of the Ohio and Erie Canal, and of a branch line of the Cincinnati, Washington, and Baltimore Railroad (Hamden to Portsmouth, 56 miles), as well as an important station on the Scioto Valley Railway. As the entrepôt for the rich mineral regions of southern Ohio and north-eastern Kentucky, and for the productive valley of the Scioto, Portsmouth has a large and growing trade both by rail and river; and it also contains iron-furnaces, rolling-mills, foundries, saw-mills, planing-mills, breweries, flour-mills, shoe-factories, hub and spoke factories, &c. Among the public buildings are an opera-house and a masonic temple. The charitable institutions include a hospital, a children's home, and a home for destitute aged women. The city has also two libraries, water-works, and tramways. The population was 6268 in 1860, 10,592 in 1870, and 11,321 in 1880. Portsmouth was laid out in 1803, and the charter of the city dates from 1814.

PORTSMOUTH, a city of the United States, capital of Norfolk county, Virginia, lies on the west bank of Elizabeth river, opposite Norfolk. It is the eastern terminus of the Seaboard and Roanoke Railroad (part of a great passenger route between Boston and New Orleans), has one of the best harbours on the Atlantic coast, is the seat of the United States Gosport navy yard (with a dry dock built of granite at a cost of \$974,536, and a large naval hospital), and exports cotton, lumber, pig-iron, and early vegetables. The population was 9496 in 1860, 11,390 in 1880, and 14,870 in 1884. Portsmouth was founded in 1752. On 20th April 1861 the navy yard—then employing 1000 men—was destroyed by fire, the loss being estimated at several million dollars.

P O R T U G A L

PART I.—GEOGRAPHY AND STATISTICS.

Plate IV. **THE** kingdom of Portugal, which is geographically a province of the Iberian Peninsula on its west coast, is bounded on the N. by the Spanish province of Galicia, on the E. by the Spanish provinces of Leon, Estremadura, and Andalusia, and on the S. and W. by the Atlantic Ocean. It lies between 36° 56' and 42° 10' N. lat. and 6° 15' and 9° 30' W. long. It is 362 miles in length by 140 in breadth, and contained by the latest (1878) computation ¹ 34,419½ square miles. Its coast-line is nearly 500 miles in length, and only one province, Tras-os-Montes, is not washed by the sea. On the extreme north the coast is low, but farther south it becomes rocky and steep for a few miles near Povoá de Varzim. From that town to Cape Carboeiro the coast of Beira is flat, sandy, and marshy, closely resembling the French Landes; after another stretch of dunes it again becomes steep and rugged from Cape Roca to Cape Espichel, and along the northern side of the Bay of Setubal, and then remains low throughout the rest of the coast-line of Estremadura (Portuguese). In Alemtejo the coast is low and in places rocky and full of shallows; and, although at Cape St Vincent the cliffs are steep and inaccessible, the general coast-line of Algarves, the southernmost province of Portugal, is low and sandy. The chief capes, which form the only cliffs on the otherwise flat and sandy coast, are Cape Mondego, Cape Carboeiro, Cape Roca, Cape Espichel, Cape Sines, Cape St Vincent, and Cape Santa Maria, and the chief bays are those of Figueira, Ericeira, Setubal, and Sines. The only islands off the coast are the dangerous Farilhões and the Berlengas off Cape Carboeiro, which would be uninhabited but for an old castle, now used as a prison, on the largest island of the latter group.

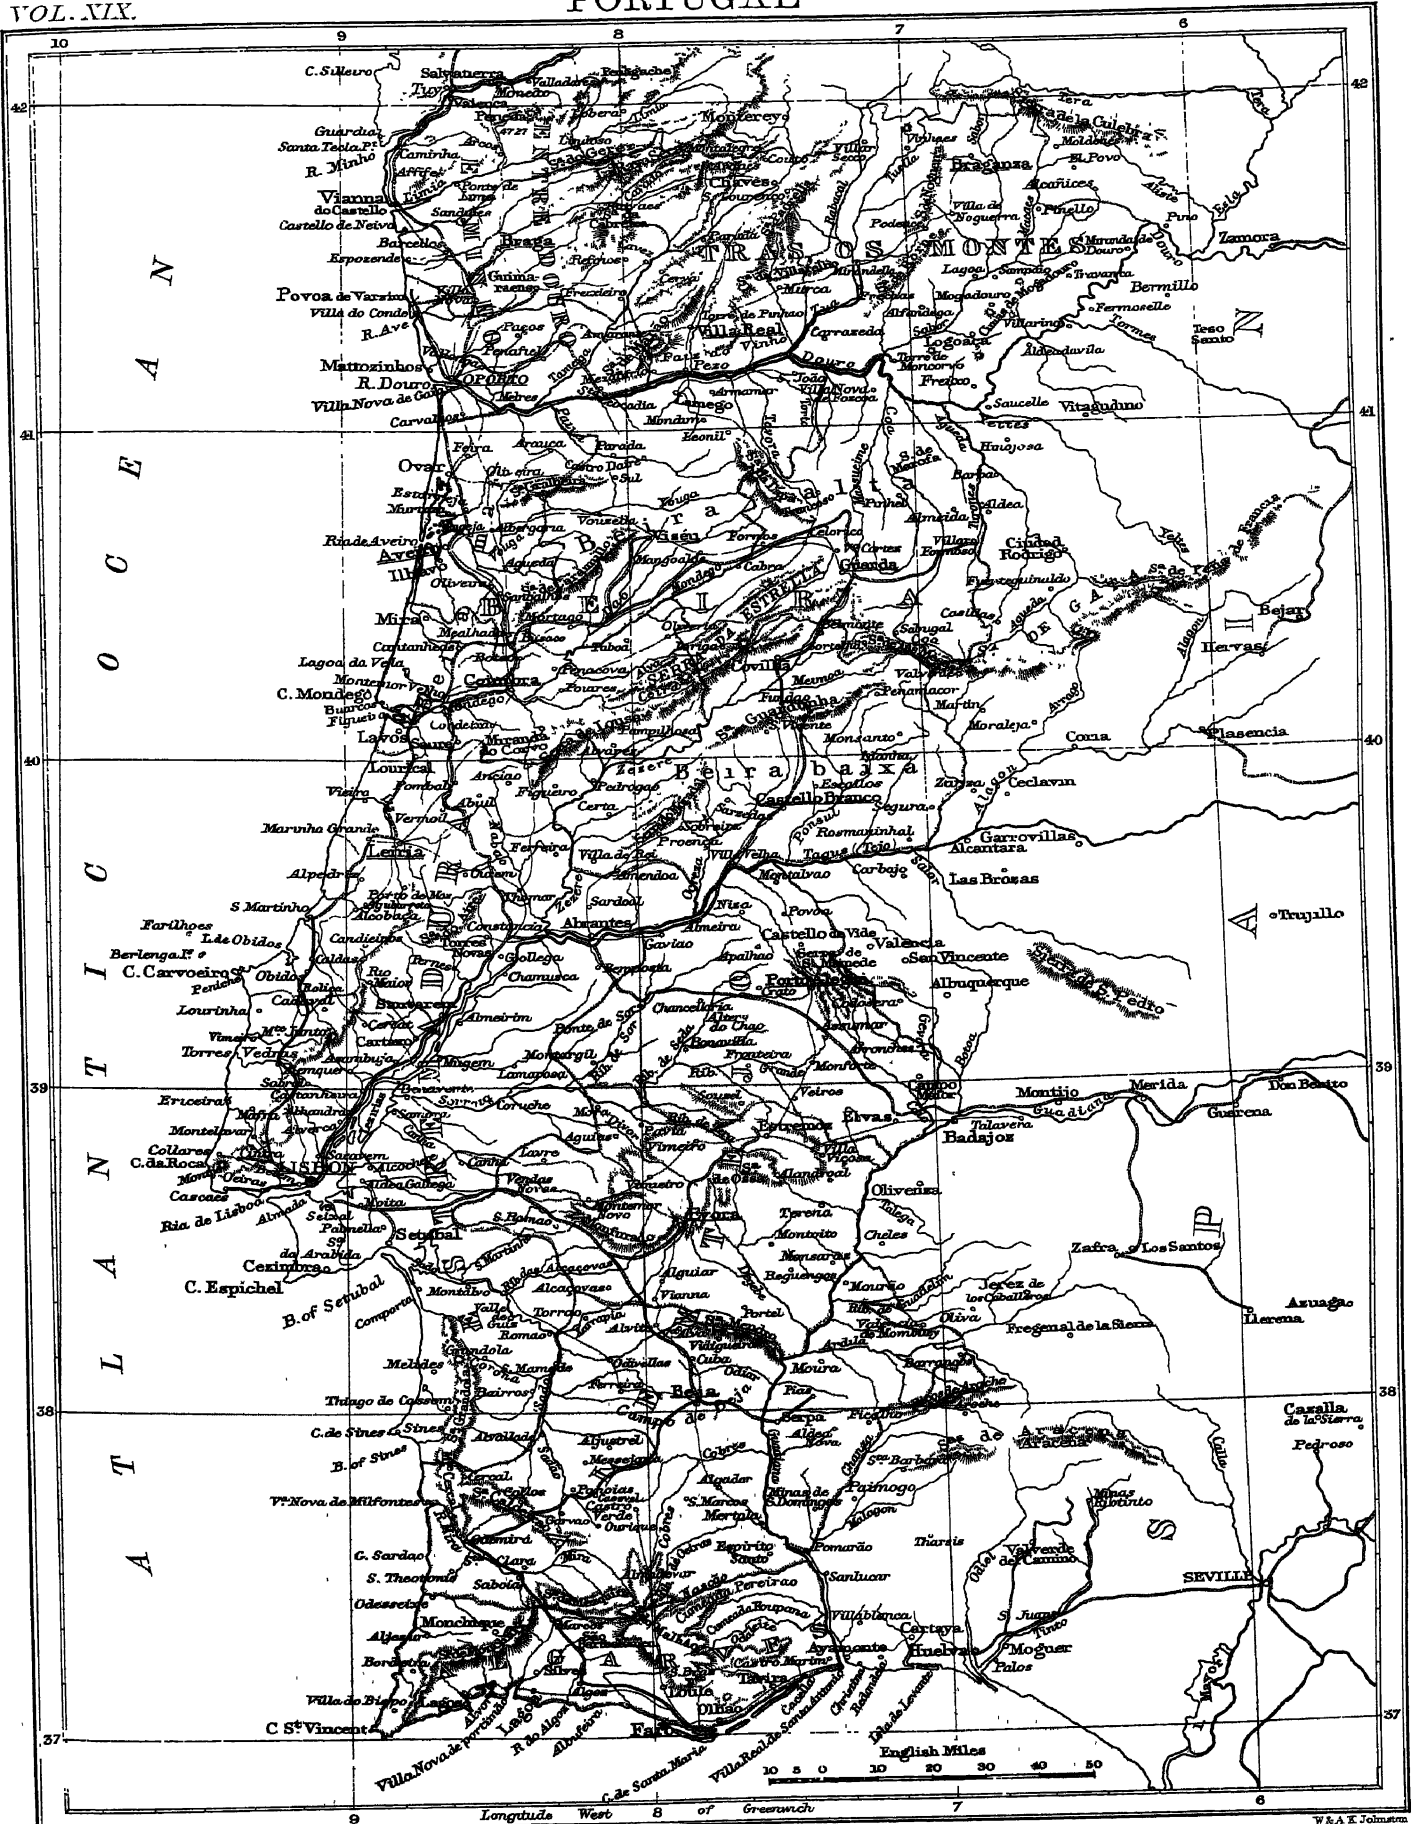

Mount-
ains. The mountain-systems of Portugal can only be adequately treated under SPAIN (*q.v.*), as they are in every instance continuations to the west or south-west of the great Spanish ranges. Thus the mountains of the Cantabrian Pyrenees in Galicia spread themselves over the two northern provinces of Portugal, Entre Minho e Douro and Tras-os-Montes, in various short ranges, of which the most important are the Serra do Gerez (4815 feet) and the Serra de Marão (4665 feet), the latter extending down the left bank of the Tameja and sheltering the wine-districts of Tras-os-Montes from the east winds. In Beira the granite Serra da Estrella (6540 feet), the loftiest range in Portugal, forms part of the system of the Guadarramas and a continuation of the Sierra de Gata, and terminates in the Serra de Lousão (3940 feet), while the chalk mountains in the south of the province, such as the Monte Junto near Santarem (2185 feet) and the Serra de Cintra, which runs into the sea at Cape Roca, belong to a different geological period. The chalk mountains of the Serra de Arrabida (1537 feet) to the south of the Tagus correspond with the Serra de Cintra, and form Cape Espichel; but the other low ranges to the south of the river in Alemtejo, such as the Serra de San Mamede (3363 feet) and the Serra de Ossa (2130 feet), belong to the system of the mountains of Toledo. The continuation of the Sierra Moreña, which separates Algarves from the rest of Portugal, forms various small ranges and isolated mountains, such as the Serra do Malhão (1886 feet) and Monte Figo, and then closes with the Serra de Monchique (2963 feet) and runs into the sea in the steep cliffs of Cape St Vincent.

Rivers. The river-system of Portugal is also merely a portion of that of Spain. Its three most important rivers, the

Douro, the Tagus, and the Guadiana, all rise in Spain and flow through that country; but they all enter the sea in Portugal, and at the mouths of the Douro and the Tagus are situated the two most important cities of the kingdom, Oporto and Lisbon. The chief Portuguese tributaries of the Douro are the Tameja, the Tua, and the Sabor on the north, and the Agueda, the Coa, and the Paiva on the south; of the Tagus, the Elja, the Ponsul, and the Zezere on the north, and the Niza, the Sorraya, and the Canha on the south; while into the Guadiana, on its right or Portuguese bank, flow the Caia, the Oeiras, and the Vascão. The other important rivers are the Minho, which forms the boundary of Portugal and Galicia in the lower part of its course, the Limia, the Cavado, the Vouga, and the Mondego to the north of the Tagus, and the Sado, the Mira, the Odelouca, and the Silves to the south of it. Important as are the rivers of Portugal, it has no inland lakes worthy of mention, though it abounds in hot and other medicinal springs, such as the Caldas de Monchique; and beautiful little mountain-lakes are numerous on the tops of the Serra da Estrella.

The climate of Portugal is particularly equable and **Clima** temperate, and its salubrious qualities were recognized by the English doctors of the 18th century, who used to send many patients to winter there, including Fielding the novelist; and, though Portugal has been superseded as a winter resort by the Riviera and Algiers, there are signs that it may again become a European health-resort of the first importance. To prove the temperate nature of the climate it is not enough to state that the average mean temperatures of Lisbon, Coimbra, and Oporto are 61°·3, 61°·1, and 60°·2 Fahr. respectively; more instructive is it to mention that the mean average temperature for the month of January is only 50°·2 at both Coimbra and Oporto, and for July only 69°·4 and 70°·3 for the same two cities, showing a difference between summer and winter of about 20°. This equability of temperature is partly caused by the very heavy rainfall which is precipitated on Portugal as one of the most westerly kingdoms of Europe and one most exposed to the Atlantic, and which has reached as much as 16 feet in a year; but it is noticeable that this heavy rainfall comes down in gradual showers spread over the whole year, and not in the torrents of the tropics. This great humidity has its drawbacks as well as its advantages, for, though it makes the soil rich, it produces also heavy fogs, which render the Portuguese coast exceedingly dangerous to ships. This charming climate and equability of temperature are not, however, universal in Portugal; they are to be enjoyed mainly in the highlands of Beira, Estremadura, and in the northern provinces, especially at Cintra and Coimbra. In the deep valleys, even of those favoured provinces where the mountains keep off the cool winds, it is excessively hot in summer; while on the summits of the mountains snow lies for many months, and it is often extraordinarily cold. Even in Lisbon itself the temperature, though its mean is only the same as that of Coimbra, varies from 38°·1 in January to 90°·6 Fahr. in July, a difference of more than 50°. In Alemtejo the climate is very unfavourable, and, though the heat is not so great as in Algarves, the country presents a far more deserted and African appearance, while in winter, when heavy rains swell the Tagus and make it overflow its banks, damp unhealthy swamps are left, which breed malaria. Notwithstanding that Algarves is hotter than Alemtejo, and

¹ Strelbitsky, *Superficie de l'Europe*, 1882.

the climate there very sultry owing to the sea-breezes being intercepted by the Serra de Monchique and other mountains, a profuse vegetation takes away much of the tropical effect, so that it is a far shadier and more agreeable province than Alemtejo. Although such a rainy country, Portugal is very rarely visited by thunderstorms; but, on the other hand, shocks of earthquake are frequently felt, and recall the great earthquake of Lisbon in 1755.

The geology, flora, and fauna of Portugal are essentially the same as those of Spain, and will be studied under SPAIN (*q.v.*).

Popula-
tion.

Population.—The population of Portugal, according to the census of 1st January 1878, was 4,160,315, and in 1881 it was calculated to be 4,306,554, or 125 persons to the square mile. The following is a table of the populations of the different provinces and districts according to the census of 1878 and the official estimate of 1881:—

Districts.	Population.		Provinces.	Population.	
	1878.	1881.		1878.	1881.
Vianna do Castello	201,890	211,539	Entre-Minho e Douro	982,735	1,014,768
Braga	319,464	336,243			
Porto	461,881	466,981			
Villa Real	224,628	225,090	Tras-os-Montes	393,279	396,676
Braganza	168,651	171,586			
Aveiro	257,049	270,266	Beira	1,323,134	1,377,432
Viseu	371,571	387,208			
Coimbra	292,037	307,426			
Guarda	258,494	264,368			
Castello Branco	173,983	178,164			
Leiria	192,982	199,645	Estremadura	911,922	946,472
Santarem	220,881	227,943			
Lisbon	498,059	518,884			
Port Alegre	101,126	105,247	Alemtejo	350,103	367,169
Evora	106,858	112,735			
Beja	142,119	149,187	Algarves	199,142	204,037
Faro	199,142	204,037			
Portugal	4,160,315	4,306,554			
Azores ¹	259,800	269,401			
Madeira	180,584	182,228			
Total	4,550,699	4,708,178			

According to the census of 1878 the following towns had a population of more than 10,000 each:—Lisbon, 246,343; Oporto, 105,838; Braga, 19,755; Setubal, 14,798; Loulé, 14,448; Coimbra, 13,369; Evora, 13,046; Tavira, 11,459; Covilhã, 10,809; Elvas, 10,471; Povôa de Varzim, 10,365; Ovar, 10,022.

The ethnological composition of the population is most mixed: in the two northern provinces the population is essentially Galician, but farther south the mixture becomes obvious; not only did the conquering Portuguese largely intermarry with the Arabs, but in the places where they exterminated them they replaced them by colonies of crusaders of all nations, chiefly French, English, Dutch, and Frisian, who have left their mark on the features and character of the nation, and they also largely intermarried with the Jews. No Jews were so wealthy or so cultivated as those of Portugal, who, though for many centuries keeping strictly apart from the Christians, yet after their forced conversion or expulsion by King Emmanuel largely intermarried, especially with the people of Lisbon. Farther south an African physiognomy appears, derived from the thousands of negro slaves imported to till Alemtejo and Algarves, from the days of Dom Henry till the decline of the Portuguese power.

Emigration is thinning the population, or rather keeping it from rapidly increasing; and the following are the results of the statistics published by the Royal Geographical Society of Lisbon for 1872-81. There emigrated in the ten years between 1871 and 1881 from Entre Minho e Douro 51,531 persons, from Tras-os-Montes 7799, from Beira 31,437, from Estremadura 12,769, from Alemtejo 42, from Algarves 225, from the Azores 22,794, from Madeira 6410, making a grand total of 133,007. Of these emigrants 129,549 were bound for America, the whole number in all probability for the Brazils,

¹ The Azores and Madeira are regarded as colonies and as an integral part of the country.

3348 for the Portuguese colonies in Africa, and 95 for Asia. It will be noticed that the majority of these emigrants come from the wealthy northern provinces and the sober population of Entre Minho e Douro, while the number from the fever-stricken Alemtejo is practically nil.

Colonies.—See AZORES, CAPE VERD ISLANDS, GOA, MACAO, Colonies. MADEIRA, MOZAMBIQUE, and COLONY (vol. vi. p. 161).

Commerce.—The commerce of Portugal has not rapidly, though Com- it has steadily, increased during the last thirty years; the chief merce. countries with which it trades are, in order of value, England and her colonies, Brazil, the United States, France, and Spain; but it is hardly fair to mention commerce with Spain, because the large amount of smuggling which takes place makes it impossible to estimate the real amount of trade between the two countries. The following table of exports and imports in nineteen classes, compiled by Mr George Brackenbury, British consul at Lisbon, dated 24th April 1884, is published in the *Consular Reports* for 1884, and contains the latest information on Portuguese trade and commerce. It will be noticed that the chief imports are bread-stuffs, metals, cottons, and minerals, and the chief exports fermented liquors, live stock (which is nearly all sent to England), and timber.

Tariff Classes.	Imports.		Exports.	
	1882.	1883.	1882.	1883.
1. Live animals	£228,329 ²	£221,908	£605,916	£640,950
2. Animal products	423,204	392,101	138,397	103,798
3. Fisheries	345,432	325,304	141,160	152,104
4. Wool and hair	495,441	514,166	59,058	58,544
5. Silk	202,551	212,818	13,638	6,554
6. Cotton	850,863	870,001	19,743	15,498
7. Flax and similar materials	169,986	169,944	5,554	5,940
8. Timber	230,514	236,093	602,116	585,272
9. Bread-stuffs	1,694,163	1,272,540	93,466	74,452
10. Colonial produce (so called)	752,145	684,921	30,893	20,511
11. Divers vegetable substances	166,183	171,956	401,232	336,704
12. Metals	1,057,394	1,359,768	616,189	143,569
13. Minerals	493,736	525,770	343,823	341,072
14. Fermented liquors	44,081	27,848	2,217,511	2,479,218
15. Glass and ceramic ware	81,016	64,728	4,353	3,854
16. Paper, and manufactures in which it is used	102,130	103,496	16,473	11,551
17. Chemical products	76,125	73,658	89,445	98,029
18. Produce and compositions of various kinds	133,844	117,699	7,693	7,852
19. Manufactures of various materials	537,234	468,459	89,762	70,114
Total	£8,083,751	£7,813,178	£5,501,012	£5,162,586

Agriculture.—The state of agriculture in Portugal is still deplorable; the wealth and energy of the country have been thrown into turbulence; the wine trade, and the production and cultivation of cereals have been so much neglected that, in spite of its being eminently adapted for such cultivation, nearly all its cereals are imported from the United States, to the value in 1883 of over £1,000,000. The wine production, on which Portugal has so long depended, was the work of the Methuen treaty of 1703, for it was not until after that treaty that the barren rocks of the Alto Douro were covered with vines. But now, though the returns show slight alteration, there must soon be a great change. The phylloxera has utterly destroyed thousands of vineyards in Entre Minho e Douro and in Beira. The labours of the phylloxera commission seem unable to check its ravages; the commissioners themselves are hindered by the people,—an inspector having been even shot at in the district of Riguengo.³ The reason why no great alteration is to be perceived in the returns is that the great Oporto shippers have such vast stocks that it may be years before the want comes to be felt. To remedy the failure, which can be only a matter of time, tobacco-growing has been proposed (see Consul Crawford's Report), and will probably be tried in place of vine-culture. Portugal has lately become a great exporter of live stock to England, as also of large quantities of fruits and early vegetables, including oranges (especially from Condeixa), lemons, limes, peaches (from Amarante), and the celebrated Elvas plums. The difference in the character of the inhabitants of different provinces is well shown by the fact that in the north the peasant not only tends his vines but in many instances rears silkworms and even possesses olive trees, while in Alemtejo he is content to live upon chestnuts and to take care of his pigs and goats.

Manufactures.—Nothing proves more decidedly the agricultural character of the Portuguese than the repeated failures to establish manufactures among them. This has often been ascribed to the provision respecting the importation of English goods in the Methuen treaty; but not all the efforts of Pombal or of the modern protectionist cabinets have been able to establish any important manufactures. The following table, extracted from Consul Brackenbury's Report, gives a list of the chief establishments—for manu-

² In the *Consular Reports* 1 milrei is taken to be equivalent to 4s. 5½d.

³ See Consul Crawford's Report, Oporto, 1884.

⁴ Mr Baring's Report.

factories they can hardly be called—in Portugal, with the number of workmen and the value of the products.

	Number of Factories.	Operatives.	Daily Wages.	Value of Products.
Carpentering	83	5,109	£256	£165,006
Wax products	21	89	2	12,584
Ceramic ware	43	2,045	97	72,079
Building	51	6,748	459	63,584
Cork-works	22	1,612	92	224,672
Tanneries	98	823	44	323,489
Distilleries	79	364	31	101,924
Food products	57	2,367	116	517,392
Metallurgy	171	5,215	325	439,669
Flour, &c., mills	62	3,182	12	125,467
Paper factories	31	1,364	69	93,293
Firewood-making	18	206	7	6,977
Soap-works	13	83	6	74,204
Tobacco-works	22	4,021	252	1,240,236
Cotton, linen, &c., weaving ..	97	39,597	330	1,152,752
Woollen-weaving	161	8,964	736	864,518
Silk-weaving	24	854	53	51,393
Typographical establishments ..	66	591	42	32,444
Clothing	134	5,328	150	348,073
Glass-works	5	908	28	37,417
Various industries	97	1,508	22	117,455
Total	1150	90,918	£3129	£6,073,658

Some of these establishments ought to be more successful, for the glass-works of Leiria, the lace-works of Vianna and Peniche, and the potteries of Aveiro had an immense reputation in the 18th century, which they have now lost, as the table clearly shows. Portugal possesses plenty of mineral wealth, though not so much as Spain, but from want of capital and enterprise such resources as exist are neglected. A very few of the chief mines may be noted—the lead-mines of Coimbra, one of antimony near Oporto, and above all the very important copper-mines of San Domingos near Beja, worked by an English company, which contributed thirteen-sixteenths of the total exports of minerals in the six months between January and June 1883. Of greater importance are the fisheries,—the fishermen both of Beira and Algarves being famous for their courage; and large quantities of sardines and preserved tunny fish are exported to Italy and France, and an even larger quantity of oysters to England.

Finance.

Finance.—The revenue of Portugal has for many years ceased to balance its expenditure, and the deficit has had to be met by borrowing, but it is only fair to remark that vigorous attempts have been made to reduce the expenditure of recent years. The estimated revenue for 1883-84 and 1884-85 was classified under six heads.

	1883-1884.	1884-1885.
Direct taxes	£1,387,790	£1,395,753
Stamps	763,777	721,778
Indirect taxes	3,643,811	3,587,136
Additional 6 per cent. (since 27th April 1882)	240,389	234,389
Domains and sundries	655,578	801,440
Repayments	285,009	244,788
Total ordinary revenue	£6,929,909	£6,985,793

A few of the sub-heads which help to swell these various classes of revenue are worth detailing.

	1883-1884.	1884-1885.
Direct taxes—		
Land tax	£700,444	£700,444
Industrial tax	243,222	250,000
Income tax	88,322	89,044
Inhabited house tax	83,778	86,556
Dividends tax	66,889	67,667
Bank tax	35,439	36,791
Titles and concessions tax	40,667	41,222
Servants and carriage tax	23,833	23,111
Indirect taxes—		
Import duties	1,637,555	1,647,112
Tobacco duties	703,555	718,467
Bread-stuffs	302,667	287,222
Octroi at Lisbon	297,773	311,583
"Real de agua"	220,000	214,222
Additional customs	128,444	145,496
Salt tax	60,000	25,778
Exports	52,844	48,089
Special 2 per cent. on export of wine ..	48,889	46,222
Domains and sundries—		
Railways	274,678	281,756
Post-office and telegraphs	151,671	177,778
Military exemption tax	64,444	60,000
Suppressed religious establishments ..	31,111	33,833
Repayments—		
Interest on stock held by the treasury	197,978	197,978

The last item deserves particular notice, as it proves the confused manner in which Portuguese financiers keep their accounts; they prefer to pay into their treasury interest on bonds held by it, instead of extinguishing that amount of the national debt.

Against this revenue must be set the expenditure (which always exceeds it), causing a deficit of £194,141 on the ordinary balance-sheet, and of £1,558,142 when the extraordinary expenditure is taken into account, in 1884-85. The chief items in the estimates for that year compared with the estimates for 1883-84 are—

	1883-1884.	1884-1885.
Public debt (of which interest on debt took up £2,832,769 in 1883-84 and £2,882,784 in 1884-85) ..	£2,901,850	£2,908,712
Ministry of finance	1,329,208	1,463,955
Ministry of the interior	482,565	491,787
Ministry of justice	142,455	149,233
Ministry of war	1,019,821	1,079,683
Ministry of the marine and colonies	379,120	372,528
Ministry of foreign affairs	70,065	73,327
Ministry of public works	618,405	639,709
Total	£6,948,489	£7,179,934

Under the head of the "ministry of finance" there was an estimated sum of £600,367 in 1883-84 and of £672,202 in 1884-85 for interest of debt, which in any other system of finance would have been put down to the head of "public debt." The extraordinary expenditure was estimated to amount to £1,364,000 in 1884-85, the chief items of which were for the ministry of public works, chiefly spent on the fortifications of Lisbon, and for the minister of the colonies, for in only two colonies—Cape Verd Islands and Macao—do the colonial revenues meet their expenditure, the mother-country having to afford substantial help to her African colonies every year. The estimated balance-sheet for 1884-85 was—

Ordinary expenditure	£7,179,934
Revenue	6,985,793

Deficit

It is very difficult to give any exact estimate of the extent of the public debt of Portugal owing to the financial confusions noted above, but on 30th June 1883 it was estimated at £96,175,692, namely—

Internal debt, new 3 per cents	£52,369,291
External debt	43,872,530
Old debt, to be converted	433,871

Total

but of this amount the treasury holds about £3,000,000.

Government.—The government of Portugal is an hereditary and Governmental monarchy, exercised under the charter of 1826, as ment, modified in 1852 and 1878, under which the king is charged with the executive and shares the power of making laws with two chambers. His civil list amounts to £144,000 a year, and he is advised in all matters of administration and assisted in nominating peers by a council of state appointed for life, but depends for advice in legislative and executive matters on a cabinet of seven members selected from the chambers by a premier, summoned by the king. The House of Peers consists of 150 members nominated by the king for life, and contains many of the most eminent professors and authors, as well as men of wealth, and additions may be made to its number by the king on the advice of the premier, with the consent of the council of state. All the members of the House of Peers do not possess titles, nor do all titled persons belong to the House of Peers; legislation and the titular and hereditary aristocracy are kept quite apart. The House of Deputies consists of 173 members, elected directly by all male citizens of twenty-five years of age, either paying in direct taxes 4s. 6d. a year, or deriving an annual income of 22s. from real estate, while all graduates, priests, officers, and certified teachers have votes without further qualification. The president of the chamber is selected by the king out of five elected candidates, and the deputies are paid. The Azores and Madeira elect members to the House at Lisbon. For administrative purposes Portugal is divided into seventeen districts, for judicial purposes into twenty-six districts or "comarcas," with appeal courts at Lisbon and Oporto, and a supreme court at Lisbon, and for military purposes into four divisions. The Roman Catholic is the state religion, but others are tolerated, and the power of the priests has been greatly checked by the wholesale suppression of monasteries in 1834. The church in Portugal is governed by a patriarch at Lisbon, two archbishops at Braga and Evora, and fourteen bishops, of whom the most important is the bishop of Oporto. For purposes of local government the districts are under the rule of civil governors, who have much the same powers as prefects in France, while in the 292 "concelhos," or administrative councils, there are elected councillors, and in the 3960 "freguezias" or parishes the villagers elect a magistrate, who has the same powers as an English justice of the peace.

Army and Navy.—Under a decree dated 19th May 1884 the Army Portuguese army has been reorganized. The effective war strength and navy is to be maintained at 120,000 men. The term of service is for 12

years, of which 3 are to be with the colours, 5 in the first reserve, and 4 in the second reserve. The force is divided into 36 regiments of infantry, 10 regiments of cavalry, 4 regiments, 1 brigade, and 4 companies of artillery, and 1 regiment of engineers. In 1883, under the old regulations, the army contained 41 general officers; its effective strength in time of peace was 33,231 men with 1643 officers, and on a war footing 75,336 men with 2688 officers. For colonial service there is one regiment of 1143 soldiers and 50 officers divided into 3 battalions, of which one is always stationed at Goa and another at Macao. The officers are trained in the military academy at Lisbon, and there is an asylum for the sons of soldiers. The navy is no longer the power it used to be, but, though small, it is equipped in modern fashion and furnished by the naval arsenal at Lisbon. It consisted in 1884 of 30 steam-ships, of which one was an armoured corvette mounting 7 guns, and 5 others corvettes mounting 46 guns, and of 14 sailing ships, of which one was a frigate mounting 19 guns. Its personnel consisted of 283 officers and 3235 sailors.

Education.

Public Instruction.—The public instruction of Portugal is regulated by the law of 1844, which enacted that all children should be bound to attend a primary school, if there was one within a mile, from the age of seven to fifteen, under penalty to the parents of a fine and deprivation of civil rights. Under this law there were in Portugal, in 1874, 2649 primary schools with 122,004 pupils of both sexes. Secondary education is not neglected, and under the same law of 1844 17 lycées have been established in the seventeen continental districts, and from them it is possible for a pupil to enter either the university of Coimbra, which during the present century has recovered some of its ancient lustre, or the special schools. These special schools are very ably conducted, and modern Portuguese policy gives, as we have seen, a higher status to teachers

and professors of all grades than they obtain in most other countries. The most important of these schools are the polytechnic school at Lisbon, the polytechnic academy at Oporto, the medical schools and industrial institutes in both these cities, the institute-general of agriculture, the royal and marine observatories, and the academy of fine arts—all four at Lisbon. The valuable public libraries of Lisbon, Evora, Villa Real, and Braga, supported by the state, and in addition the free library at Oporto, ought also to be mentioned, as well as the archives at the Torre del Tombo, with which a school of paleography and diplomacy has lately been connected.

Public Works.—On 1st January 1884 there were 1245 miles of Public railway open (944) and in course of construction (301), also 50 miles works of tramways were open, and 2900 miles of telegraph were in operation; and every recent loan has been raised for the purpose of extending these important public works. The chief lines of railway open are those from Lisbon to Valencia de Alcántara, and thence by Talavera to Madrid, and from Lisbon to Oporto, Tua, Nine, and Braga, while the line to Faro, which is to connect Algarves with the capital, has been already extended beyond Beja as far as Casével. There is also an alternative line to Madrid open through Elvas and Badajoz, which connects Lisbon with the Andalusian system and gives a short route to Seville, Cadiz, and Malaga. As to smaller lines opening up Beira, the line from Figueira da Foz to Villar Formosa through Celorico and Guarda is completed, and one is projected parallel to the Lisbon-Oporto line from Villar Formosa to Alcántara on the south, which is to be connected with Oporto through Tua towards the west. The telegraph system is already very complete, and the last touch has been put to it by laying down a submarine cable from Lisbon to Rio de Janeiro, binding the mother-country still more closely with what was once her greatest colony. (H. M. S.)

PART. II.—HISTORY.

It has been stated that geographically the kingdom of Portugal is an integral part of the Iberian Peninsula; the only reason why it has retained its independence, while the other mediæval states of that peninsula have merged into the kingdom of Spain, is to be found in its history. When Philip II. of Spain annexed Portugal it was a century too late for it to coalesce with Spain. It had then produced Vasco de Gama and Affonso de Albuquerque, and its language had been developed from a Romance dialect into a literary language by Camoens and Sá de Miranda. Conscious of its national history, it broke away again from Spain in 1640, and under the close alliance of England maintained its separate and national existence during the 18th century. A union with Spain might have been possible, however, during the first half of the present century had not a generation of historians and poets arisen, who, by recalling the great days of the Portuguese monarchy, have made it impossible for Portugal ever again to lose the consciousness of her national existence.

Early history.

The history of Portugal really begins with the gift of the fief of the Terra Portucalensis or the county of Porto Cale to Count Henry of Burgundy in 1094; for any attempt to identify the kingdom of Portugal and the Portuguese people with Lusitania and the Lusitanians is utterly without foundation. With the rest of the Iberian Peninsula, Portugal was colonized by the Phœnicians and conquered by the Carthaginians; and the Roman province of Lusitania, whether according to the division of Iberia into three provinces under Augustus or into five under Hadrian, in no way coincided with the historical limits of the kingdom of Portugal. In common with the rest of the Peninsula, it was overrun by the Vandals, Alans, and Visigoths, and eventually conquered by the Arabs in the 8th century. It was not until the 15th century that an attempt was made by Garcia de Menezes to identify Lusitania with Portugal. Under the influence of the Renaissance, Bernardo de Brito insisted on the identity, and claimed Viriathus as a Portuguese hero. Other writers of the same epoch delighted in calling Portugal by the classical name of "Lusitania," and Camoens, by the very title of his great epic, *Os Lusíadas*, has immortalized the appellation.

For two centuries Portugal remained subject to the

Omayyad caliphs, and under their wise rule the old Roman colonizæ and municipia, such as Lisbon, Lamego, Viseu, and Oporto, maintained their Roman self-government and increased in wealth and importance. Towards the close of the 10th century, as the Omayyad caliphate grew weaker, the Christian princes of Visigothic descent who dwelt in the mountains of the Asturias began to grow more audacious in their attacks on the declining power, and in 997 Bermudo II., king of Galicia, won back the first portion of modern Portugal from the Mohammedans by seizing Oporto and occupying the province now known as Entre Minho e Douro. In the beginning of the 11th century the Omayyad caliphate finally broke up, and independent emirs established themselves in every large city, against whom the Christian princes waged incessant and successful war. In 1055 Ferdinand the Great, king of Leon, Castile, and Galicia, invaded Beira; in 1057 he took Lamego and Viseu, and in 1064 Coimbra; and his son Garcia, who succeeded him as king of Galicia in 1065, maintained Nuno Mendes, count of Oporto, and Sesnando, a renegade Arab wazir, count of Coimbra, as feudal vassals of his court. In 1073 Alphonso VI., the second son of Ferdinand the Great, united once more his father's three kingdoms, and for a time rivalled his father's successes, until a fresh outburst of Mohammedan fanaticism ended in the rise of the Almoravide dynasty, and the defeat of the Christian king at Zalaca in 1086 by Yûsuf ibn Teshufin. To resist this revival of the Mohammedan power, Alphonso VI. summoned the chivalry of Christendom to his aid, and among the knights who came to his assistance were Counts Raymond and Henry of Burgundy. In the days of his success Alphonso had compelled Motawakkil of Badajoz to cede to him both Lisbon and Santarem, but the fortune of war had changed, and Sîr, the general of the Almoravide caliph Yûsuf, retook both cities. Alphonso felt the need of a valiant warrior on his Galician frontier, and in 1094 he combined the fiefs of Coimbra and Oporto into one great county and conferred it upon Henry of Burgundy with the hand of his illegitimate daughter Theresa, while to Raymond he gave Galicia and his legitimate daughter and heiress Urraca.

Count Henry of Burgundy, the first count of Portugal,

Henry of Burgundy was the second son of Henry, third son of Robert, first duke of Burgundy, and was in every way a typical knight of his century, a brave restless warrior, and a crusader; but when once firmly established in his county he thought much more about his chances of succeeding his father-in-law as king than of trying to carve a kingdom for himself out of the dominions of the Mohammedan caliphs. When, therefore, Alphonso VI. died in 1109 and left his thrones to his daughter Urraca, and nothing to Henry, the Burgundian at once invaded Leon. For five years the Christian princes, Henry of Burgundy, Alphonso Raimundes (the son of Count Raymond), Alphonso of Aragon, and Queen Urraca, fought together, while Sir was consolidating the Almoravide power, until Count Henry died suddenly at Astorga in 1112, leaving his wife Theresa to rule the county of Portugal during the minority of his infant son, Affonso Henriques.

Theresa, who ruled at Guimarães during her son's minority, was a beautiful and accomplished woman, who devoted all her energies to building up Affonso's dominions into an independent state, and under her rule, while the Christian states of Spain were torn by civil wars, the Portuguese nobles were prevented from interfering, and began to recognize Portugal as their country, and to cease from calling themselves Galicians. Her regency was a stormy one in spite of all her efforts to maintain peace: in 1116 she was persuaded by Gelmires, bishop of Santiago, to try and extend her frontier towards the north, and seized Tuy and Orense; in 1117 she was besieged by the Mohammedans in Coimbra; and in 1121 her sister Urraca took her prisoner, but, through the interposition of Bishop Gelmires and Mauricio Burdino, archbishop of Braga, peace was quickly made between them. For the next few years a curious parallelism appears between the careers of the two sisters: Urraca showered favours on her lover, Pedro de Lara, until her young son Alphonso Raimundes, or Alphonso VII. of Leon and Castile, with the help of Bishop Gelmires, revolted against her; and with equal blindness Theresa favoured her lover, Fernando Peres de Trava, whom she made governor of the cities of Oporto and Coimbra, until she was detested by the boy Affonso Henriques, and Paio, archbishop of Braga. They did not, however, break out into open revolt until after a successful invasion by Alphonso VII. of Leon and Castile, who forced Theresa to recognize his supremacy in 1127. Her son refused to ratify her submission, and rose in rebellion with Archbishop Paio, Sueiro Mendes, Sancho Nunes, and others; and at the battle of San Mamede on 14th June 1128 Theresa was taken prisoner, and then wandered about in Galicia with her lover until her death in 1130.

Affonso
Hen-
riques.

Affonso Henriques, who at the age of seventeen assumed the government, was one of the heroes of the Middle Ages; he succeeded to the rule of the county of Portugal when it was still regarded as a fief of Galicia, and after nearly sixty years' incessant fighting he bequeathed to his son a powerful little kingdom, whose independence was unquestioned, and whose fame was spread abroad throughout Christendom by the reports of the victories of its first king over the Mohammedans. The four wars of independence which Affonso Henriques waged against Alphonso VII. lasted more than twelve years, and were fought out on the Galician frontier with varying success, until the question of Portuguese independence was peaceably established and confirmed by the valour of the Portuguese knights, who overcame those of Castile in the famous tournament of Valdevez, and Affonso Henriques assumed the title of the king of Portugal. The independence of Portugal from Galicia being thus finally achieved, Affonso Henriques abandoned the idea of extending his dominions towards the north, and devoted the next twenty-five years of his

life to one long crusade against the Mohammedans, and to extending his frontier towards the south. The state of the Mohammedan power in Spain was particularly favourable to his enterprise. The wave of Moslem fanaticism which had created the Almoravide dynasty had exhausted itself, and independent chiefs had established themselves again in the different provinces, while in Africa 'Abd al-Mumen, the successor of the Almohade mahdi, was destroying the power of the Almoravides by means of yet another wave of fanaticism. As early as 1135 Affonso had built the castle of Leiria to protect his capital, Coimbra, but for some years he left the task of attacking the Mohammedans to the Knights Templars and Knights Hospitallers, who made incessant incursions from their headquarters at Soure and Thomar. But the castle of Leiria had soon fallen; and in 1139, after the flower of Mohammedan Spain had crossed over to Africa under Teshufin, the last Almoravide caliph, to fight the Almohades, and when Alphonso VII. was making his second incursion into the heart of Andalusia, Affonso Henriques collected his whole army and invaded the province of the Kasr ibn Abi Dânes. Advancing to the south of Beja, he met the united forces of all the neighbouring cities under a wâli named Ismar, and completely routed him at Orik or Ourique on 25th July. This battle has been surrounded with a mass of legends: it was solemnly asserted two hundred years afterwards that five kings and 200,000 Mohammedans were utterly defeated, and that after the battle Affonso was proclaimed king by his soldiers. Such legends hardly need contradiction; the victory was a great one, but it was obtained over provincial emirs; and it was not by victories over Mohammedans but by struggles with his Christian cousin Alphonso VII. that independence was to be won. Of still later invention was the fiction of the cortes of Lamego, and the passing of the fundamental laws of the monarchy, on which Vertot and other writers have expended so much eloquence. Of great significance with regard to the legendary splendour of the victory is the fact that in the very next year Ismar or Omar, the emir who was defeated at Ourique, was able to take the field again, when he once more seized the castle of Leiria, and destroyed it. In 1143 a regular peace was concluded between Alphonso VII. and Affonso Henriques at Zamora through the mediation of the cardinal Guy de Vico, when Affonso Henriques was finally recognized as king, and promised to be a vassal of the pope, and to pay him four ounces of gold annually. For many subsequent years the history of Portugal is merely a narration of wars against the Mohammedans. Abû Zakaria, wazîr of Santarem and Mohammedan leader in the Belatha (a district including the banks of the Tagus and the cities of Lisbon, Santarem, and Cintra), defeated the Templars at Soure in 1144, but in 1147 Santarem itself was surprised and taken on 15th March. Of still more importance was the capture of Lisbon in the same year. A number of German crusaders from the Rhine and Flanders under Count Arnold of Aerschot and Christian Ghistell, and of English crusaders under their constables, Hervey Glanvill, Simon of Dover, Andrew of London, and Saher d'Arcellis, put in at Oporto on their way to Palestine, and were persuaded by the bishop to commence their holy work by assisting in the siege of Lisbon. With their help the ancient city, which claimed to have been founded by Ulysses, and which had three times—in 792, in 851, and in 1093—been taken by the Christians and held for a short time, was finally captured on 24th October by Affonso Henriques, who also persuaded many of the crusaders to settle and form colonies in Portugal. The series of conquests continued: Cintra, Palmella, and Almada quickly surrendered, and at last, after a failure in 1152, the great city of Alcácer

Portugal
a king-
dom.

do Sal was taken in 1158. In 1161 Affonso Henriques met with his first important check. The Almohade caliphs, having at last triumphed in Africa, determined to extend their power to Spain, and on the arrival of their troops the Portuguese king was defeated. Then the character of the war changed. A disputed succession weakened the Almohade caliphate, and independent bands of "salteadors," who were little better than brigands or free-lances, began to establish themselves in the cities of Alemtejo; such was Giraldo Sempavor, who took Evora in 1166.

Affonso Henriques became ambitious to win the great city of Badajoz, although by a treaty signed at Cella Nova with Alphonso VII. he had undertaken to confine his conquests to the right bank of the Guadiana. No doubt it was owing to the death of his cousin and the separation of the kingdoms of Castile and Leon that he believed he could effect his purpose. But his son-in-law, Ferdinand of Leon, would not allow such a breach of treaty, and determined to oppose it; and Affonso Henriques made the fatal mistake of again mixing himself up in Spanish affairs by invading Galicia in 1167. At last, in 1169, he formed the siege of Badajoz; Ferdinand at once invested the besieger in his camp, and the Portuguese hero was severely wounded and taken prisoner. To gain his freedom he was compelled to surrender his conquests in Galicia, and Ferdinand nobly inflicted no harsher terms; nevertheless the old king never recovered from the effect of his wound, and the remaining exploits of his reign were the work of his son Dom Sancho. By 1169 the internal dissensions of the Mohammedans were over, and the new Almohade caliph, Yúsf Abú Ya'kúb, crossed over to Spain with a large army. He speedily reconquered all the Portuguese acquisitions in Alemtejo, and in 1171, after a vain attempt to take Santarem, made a truce for seven years with Affonso Henriques, who in the following year admitted his son Sancho as king with himself, and left him all the duties of war. Dom Sancho proved himself the worthy son of his father, and for twelve years Alemtejo was one great battle-ground. The greatest struggle was in 1184, when Yúsf brought over fresh forces from Africa, and again besieged Santarem; but pestilence defended the city, and on 4th July Sancho utterly defeated the fever-stricken army of the besiegers, Yúsf himself being mortally wounded in the battle. This triumph worthily closed the reign of the great crusader king, Affonso Henriques, who died on 6th December 1185.

Sancho I. The fame of Dom Sancho I., "the Povoador" or "City-builder," rests more on his internal administration than on his early exploits as a soldier. But before he had time to obey his inclinations he had to continue a war of life and death with the Mohammedans. In 1189 he conquered Algarves and took Silves, the capital of the province, with the help of some English, Dutch, Danish, and Frisian crusaders; but the conquest was not final, for in 1192 Yúsf Abú Ya'kúb reconquered not only Algarves but the whole province of Alemtejo, including Alcácer do Sal, failing only before Santarem. Finding the Mohammedans under their great Almohade caliph too dangerous to attack again, Dom Sancho made peace with them, and for some years, until 1200, concerned himself with the affairs of Spain, waging continuous war against Alphonso IX. of Leon without any particular result. His internal administration was far more important. During his father's reign there had been nothing but fighting, and, except in Lisbon and Oporto, where a large trade for that period had arisen, and in the northern provinces of Entre Minho e Douro and Tras-os-Montes, where agriculture survived, the scanty population lived chiefly on the spoils taken in their yearly incursions on the Mohammedans. Sancho therefore both

encouraged the growth of towns and fostered agriculture. The Portuguese towns had almost without exception preserved their old Roman local self-government, which had been taken advantage of by the Mohammedans; and Sancho wisely followed their example, while he encouraged the increase of population by wise laws, and furthered immigration, especially from the crusaders of England, France, and the north of Europe. The country districts he treated on a different principle. He granted large tracts of land to noblemen and cities and the military orders, on condition that they should be cultivated and occupied. The later years of Sancho's reign were filled with disputes with Pope Innocent III. This struggle bears a curious resemblance to the quarrels of Henry II. with the pope, which had raged a few years earlier in England. Dom Sancho had insisted on priests accompanying their flocks to battle, and also on making them amenable to the secular courts. This seemed monstrous to Innocent, who sent legate after legate to demand Sancho's submission and the payment of the tribute to the Holy See. But the king had in his chancellor Julião the first Portuguese student who studied the revival of Roman law at Bologna, and who had imbibed broad views there as to the papal power, and he in Sancho's name asserted the king's full right even to dispose of the estates of the church in his kingdom if he liked. This general quarrel was complicated by the behaviour of Martinho Rodrigues, bishop of Oporto, who was hated alike by his chapter, the king, and the people of his city, and who, after being besieged in his palace for five months, escaped to Rome, and claimed the pope's protection in 1209. Sancho was now in weak health and in no mood to continue the struggle, so in 1210 he yielded to all the demands of the pope and the bishops; then, after giving large estates to his sons and daughters, he retired to the convent of Alcobaça, where he died in 1211, leaving a reputation as a warrior and a statesman only second to that of his father.

The reign of Affonso II. "the Fat" is chiefly important **Affonso** in the constitutional history of Portugal, and for one II. memorable feat of arms, the recapture of Alcácer do Sal. On his father's death, Affonso, probably by the advice of the chancellor Julião, summoned a cortes or parliament, consisting of the bishops, "fidalgos," and "ricos homens" of the realm, which is the first on record, as that at Lamego in 1143 is apocryphal. The king assented to the final compact which his father had made with the church, and propounded a law of mortmain, probably drawn up by Julião, by which the church could receive no more legacies of land, because it could not perform military service. Affonso himself proved to be no warrior, but he was very tenacious of the wealth and power of the crown, and refused to hand over to his brothers the large legacies which Dom Sancho had left to them; and it was not until after a long civil war, in which Alphonso IX. of Leon joined, that he gave his sisters their legacies, at the same time taking care that they all became nuns, while his brothers went into exile, and never obtained their lands at all. Though Affonso himself was no soldier, the Portuguese infantry showed how free men could fight at the battle of Navas de Tolosa in 1212; and his ministers, bishops, and captains took advantage of the weakness of the Almohades after this great defeat to reconquer Alemtejo, and in 1217 they retook Alcácer do Sal, and defeated the wális of Andalusia with the help of a body of crusaders. In this expedition the king took no part; he was more bent upon filling his treasury, which soon brought him again into conflict with the church. His chancellor, Gonçalo Mendes, inherited the policy of Julião, and encouraged him to lay hands on the lands of the archbishop of Braga, Estevão Soares,

whereupon Pope Honorius III. excommunicated the king and laid an interdict upon the kingdom until Affonso should make compensation and should expel his chancellor from court. This Affonso refused to do, and he was still under the interdict of the church when he died in 1223.

Sancho
II.

Sancho II. was only thirteen when he succeeded his father, and, as might have been expected during a minority, the turbulent nobility and intriguing bishops tried to undo the late king's labours to consolidate the royal power. The old statesmen of Affonso II.—Gonçalo Mendes, the chancellor, Pedro Annes, the "mordomo mor" or lord steward, and Vicente, dean of Lisbon—saw that it was necessary to get the interdict removed if there was to be peace during the king's minority, and so they prudently retired into the background. Estevão Soares, the archbishop of Braga, then became the most powerful man in the kingdom, and, with Abril Peres, the new mordomo mor, he agreed with Alphonso IX. of Leon that the Portuguese should attack Elvas at the same time that the Spaniards laid siege to Badajoz. The siege of Elvas was completely successful; the young king greatly distinguished himself, and in the following year, 1227, felt strong enough to reinstate his father's old friends in office, making Vicente chancellor, Pedro Annes once more mordomo mor, and Martim Annes "alferes mor" (standard-bearer). This change of power greatly disconcerted the bishops and clergy, who began to intrigue for the overthrow of the young king, but he wisely continued to occupy himself with fighting the Mohammedans, knowing well that the pope would not dare to attack a crusading monarch. He endeavoured to imitate closely his cousin St Louis of France, and his wise policy secured him the protection of the pope, who in 1228 sent John of Abbeville as legate, with full powers to rebuke the Portuguese bishops. The legate made the chancellor, Vicente, bishop of Guarda, and highly commended the favour shown by the king to the friars, who had been introduced into Portugal by his aunts, and to the military orders. But in 1237 Dom Sancho II. had another serious quarrel with the church, and an interdict was laid on the kingdom; but prompt submission to Pope Gregory IX. secured immediate pardon. Meantime his old and wise counsellors had mostly died, and his court was thronged with gay young knights and troubadours. He again attacked the Mohammedans, and invaded Algarves; and in 1239 he took Mertola and Ayamonte, in 1240 Cacello, and in 1244 Tavira. Unfortunately in the interval between 1240 and 1244 the king fell in love with a Castilian lady, Donna Mencia Lopes de Haro, the widow of Alvares Peres de Castro, whom he probably married. This union was most distasteful to the Portuguese people, and furnished the bishops with a pretext for forming a party and overthrowing him, provided they could find a leader and obtain the assistance of the pope. In 1245 the king's brother, Affonso, who had settled at the court of his aunt, Blanche of Castile, queen-dowager of France and mother of Louis IX., and who had there married the heiress of Boulogne, offered himself as a leader to the Portuguese malcontents. The pope at once issued a bull, deposing Sancho, and João Egas, archbishop of Braga, Tiburcio, bishop of Coimbra, and Pedro Salvadores, bishop of Oporto, went to Paris and offered Affonso of Boulogne the crown of Portugal on certain conditions, which he accepted and swore to obey. In 1246 Affonso arrived at Lisbon, and solemnly declared himself the defender of the kingdom; and for two years a civil war raged, which ended in Dom Sancho's retiring to Toledo, where he died on 8th January 1248.

Affonso
III.

With such a commencement it might have been expected that the reign of Affonso III. would have been a period of civil war and internal dissension, or at least of complete submission to the church and the feudal nobility, but, on

the contrary, it was from a constitutional point of view the most important of all the early reigns, and also that in which Portugal concluded its warfare with the Mohammedans and attained to its European limits. In short, Affonso III. was essentially a politic king, if not a high-principled man. On his brother's death he exchanged his title of "visitador" or "curador" of the kingdom for that of king, and at once prepared to complete the conquest of Algarves. Aided by his uncle Dom Pedro and the Knights Hospitallers under Gonçalo Peres Magro, he speedily reduced the remainder of the province. This rapid extension of the Portuguese territory was by no means agreeable to Alphonso X. "the Wise," king of Leon and Castile; but, after a short war, Affonso III. consented to marry Alphonso's illegitimate daughter, Donna Beatrice de Gusman, and to hold Algarves in usufruct only. He then turned his attention to his own position in Portugal, and determined to bridle the power of the bishops, in spite of his oath at Paris. Perceiving that this could only be done with the help of the mass of the people, he summoned a cortes at Leiria in 1254, to which representatives of the cities were elected and sat with the nobles and higher clergy. With the help of this cortes—one of great importance in the constitutional history of Portugal—he dared the interdict laid upon the kingdom for having married again (the daughter of Alphonso the Wise) whilst his first wife (Matilda, countess of Boulogne) was alive. Finally, however, on the petition of the archbishops and bishops of Portugal, Pope Urban IV. legalized the disputed marriage in 1262 and legitimated his elder son, Dom Diniz, while in 1263 Alphonso X. made over to him the full sovereignty of Algarves. On the other hand, the people made use of their power, and in a full cortes at Coimbra in 1261 the representatives of the cities boldly denounced Affonso's tampering with the coinage, and compelled recognition of the fact that taxes were not levied by the inherent right of the king but by the free consent of the people. After a prosperous and successful reign Nemesis came upon Affonso in the rebellion of his eldest son Diniz in 1277, which continued until 1279, in which year the king died.

The period of war and of territorial extension in the Diniz Peninsula was now over, and the period of civilization was to dawn. Territorially and constitutionally Portugal was now an established kingdom; it remained for it to become civilized and thoroughly homogeneous before the great heroic period of exploration and Asiatic conquest should begin. No better man for such work than the new king, Dom Diniz, could have been found: he was himself a poet and loved letters; he was a great administrator and loved justice; above all he saw the need of agriculture and the arts of peace to take the place of incessant wars, and nobly earned the title of the "Ré Lavrador," or "Denis the Labourer." From all these points of view his reign is of vast importance in the history of Portugal, though, like all reigns of peaceful progress, it is not signalized by many striking events. It began with a civil war between Diniz and his brother Affonso, who disputed his legitimacy, which ended in a compromise; and in 1281 Diniz married Isabel, daughter of Pedro III. of Aragon, who for her pure and unselfish life was canonized in the 16th century. His reign is only marked by one war with Sancho IV. and his successor, Ferdinand IV., of Castile and Leon, which was terminated in 1297 by a treaty of alliance, according to the terms of which Ferdinand IV. married Constance, daughter of Diniz, while Affonso, the heir to the throne of Portugal, married Beatrice of Castile, sister of Ferdinand. Still more interesting are the king's relations with Edward I. of England, with whom he exchanged many letters, and with whom he made a commercial treaty in 1294. He corresponded also often with

Edward II. of England, and agreed with him in 1311 that the Knights Templars had been greatly maligned; and on their suppression by Clement V., recollecting the great services which the military orders had rendered to Portugal and their great power, Dom Diniz founded the Order of Christ, and invested it with the lands of the Templars, thus at once obeying the pope and avoiding a serious disturbance at home. The king showed his love of agriculture by the foundation of agricultural schools and homes for farmers' orphans, as well as by encouraging improved farming, and by establishing the pine forest of Leiria, his love of justice by wise laws, checking, though not abolishing, the feudal courts, and by the appointment of royal corregidores in every town of which the crown possessed the franchise, and his love for commerce by his commercial treaty with England, and by the foundation of a royal navy, of which a Genoese, named Emmanuel Pessanha, was the first admiral. But his real affection was for literature: he encouraged a school of Portuguese poets at his court, and established a university at Lisbon, which, after many changes, found a permanent home at Coimbra. At the end of this reign war broke out between the king and the heir-apparent, and a pitched battle was only prevented in 1323 by St Isabel riding between the armies and making a peace between her husband and her son, which lasted until the death of the great peace-monarch, the Ré Lavrador, in 1325.

Afonso IV. Afonso IV. pursued his father's policy of making family alliances with the kings of Aragon and Castile, and in 1328 married his daughter, Donna Maria, to Alphonso XI. of Castile, who neglected her, and for her sake Afonso IV. declared war against Castile. Peace was made through the intervention of St Isabel in 1340, when Dom Pedro, son of Afonso, married Constance Manuel, daughter of the duke of Penafiel, and Afonso IV. himself promised to bring a strong Portuguese army to the help of Alphonso XI. against the emir of Morocco, Abú Hamem, who had crossed the straits to assist the sultan of Granada. The united Christian armies won a decisive victory at the river Salado, in which Afonso especially distinguished himself, and earned the title of "the Brave"; from that time he remained at peace with Castile, and further strengthened his position in Spain in 1347 by marrying his daughter, Donna Leonora, to Pedro IV. of Aragon. The later years of the reign of Afonso IV. were stained by the tragedy of Donna Ines de Castro. (See vol. v. p. 202.)

Pedro I. The first act of Dom Pedro on ascending the throne in 1357 was to punish the murderers of Ines; and further, to show his love for her, he had her dead body disinterred and crowned, and afterwards solemnly buried with the kings and queens of Portugal in the convent of Alcobaça. The spirit of stern, revengeful justice which had marked the commencement of his reign continued to show itself in all matters of administration; he punished priest and noble with equal severity, and the people gave him the title of "Pedro the Severe." Like his grandfather, he greatly valued the friendship of England, and was on intimate terms with Edward III., who in 1352 had ordered his subjects by proclamation never to do any harm to the Portuguese. A curious sequel to the commercial treaty of 1294 was executed in 1353, when Afonso Martins Alho, on behalf of the maritime cities of Portugal, signed a treaty with the merchants of London guaranteeing mutual good faith in all matters of trade and commerce. This is the most interesting feature of Dom Pedro's short reign.

Ferdinand. The accession in 1367 of Ferdinand, the only son of Pedro by Constance, marks a crisis in the history of the Portuguese monarchy. As a natural result of the long peace which had succeeded the final conquest of Algarves, the people of Portugal had grown richer, more cultivated, and

more conscious of their nationality, while the court had grown more and more dissolute and more out of consonance with the feelings of the people. If the Portuguese monarchy was to continue to exist, it was obvious that it must become again a truly national monarchy, as it had been in the days of Afonso Henriques, and that the kings must remember their duties and not think only of their pleasures. The life and reign of Dom Ferdinand are marked, like those of his father, by a romantic amour, which, if not so tragic as the story of Ines de Castro, had far greater political importance. Ferdinand was a weak and frivolous but ambitious king, who, after binding himself to marry Leonora, daughter of the king of Aragon, suddenly claimed the thrones of Castile and Leon in 1369 on the death of Pedro the Cruel, through his grandmother, Beatrice of Castile, and was favourably received at Ciudad Rodrigo and Zamora. But the majority of the Castilian nobles did not wish to see a Portuguese monarch on their throne, and welcomed the illegitimate Henry of Trastamare as Henry II. of Castile. The contest ended in 1371 through the intervention of Pope Gregory XI., Ferdinand agreeing to surrender his claims on Castile and to marry Leonora, daughter of Henry II. However, in spite of the pope, this treaty was never carried out; Ferdinand had seen and fallen passionately in love with Donna Leonora Telles de Menezes, daughter of a nobleman in Tras-os-Montes and wife of João Lourenço da Cunha, lord of Pombeiro. For love of this lady, whom he eventually married, he refused to fulfil his treaty with Castile; but Henry II. strongly resented this insult, and taking up arms invaded Portugal and laid siege to Lisbon. Ferdinand entered into negotiations with John of Gaunt, who also claimed Castile through his wife Constance (daughter of Pedro the Cruel), and he signed a treaty of alliance through his ambassador, João Fernandes Andeiro, with Edward III. of England. Donna Leonora, however, did not approve of the English alliance, and in 1374 Ferdinand made peace with Castile through the mediation of Cardinal Guy of Boulogne. The queen was now supreme, and terrible in her tyranny. She had not even the merit of constancy, for she fell in love with Andeiro, the late ambassador to England, and induced the king to make him count of Ourem. Ferdinand himself continued to aspire to the throne of Castile; and in 1380, after the death of Henry II., he again sent Andeiro to England to procure assistance for a new war against Henry's successor, John I. Richard II. of England received the ambassador graciously, and in 1381 the earl of Cambridge, brother of John of Gaunt, arrived with a powerful force, and his son Edward was betrothed to Donna Beatrice, Ferdinand's only child, who had been recognized as heiress to the throne by a cortes at Leiria in 1376. But the Portuguese king, as usual, failed to keep faith, and in 1383, under the influence of the queen, he deserted the English, who then ravaged Portugal and made peace with John I. of Castile at Salvaterra. By this treaty John I. engaged to marry Donna Beatrice, and it was arranged that Queen Leonora should be regent of Portugal until Beatrice's eldest son came of age. Six months afterwards, on 22d October, King Ferdinand died, and Donna Leonora assumed the regency.

But she did not hold it long. The whole Portuguese Regency people detested her, and their feeling of nationality was of Leonora. outraged by the contemplated union of their crown with that of Castile. Dom John, grandmaster of the Knights of St Bennett of Aviz, and an illegitimate son of Pedro the Severe, shared both the personal hatred for the queen and the political desire for independence, and on 6th December he headed an insurrection at Lisbon and slew the queen's lover, Andeiro, in the precincts of the palace. Leonora fled to Santarem and summoned John I. of Castile to her

help, while Dom John was proclaimed defender of Portugal, João das Regras being appointed chancellor and Nuno Alvares Pereira constable. Dom John sent to England for assistance, which was promised him, and put the capital in a state of defence. In 1384 John of Castile entered Portugal and formed the siege of Lisbon. The resistance was worthy of the cause; the archbishop of Braga fought like a knight; but a pestilence in the besiegers' camp did them more mischief than even the bravery of the besieged, and John I. had to retire defeated. Before doing so he discovered that Donna Leonora had plotted to poison him, so he seized her and imprisoned her in the convent of Tordesillas, where she died in 1386. But it availed little to have repulsed one Castilian army; the relative sizes of Portugal and Castile made it obvious that the struggle would be a severe one; the independence of Portugal was at stake, and the Portuguese fought as men fight for their existence as a nation. The heroic constable, who won the surname of the "Holy Constable," defeated the Castilians at Atoleiro and Trancoso. On 6th April 1385 a cortes assembled at Coimbra, and declared the crown of Portugal to be elective, choosing, at the instance of the chancellor, Dom John to be king of Portugal. King John then called all his chivalry together, with the freemen of his cities, and, with the help of 500 English archers, utterly defeated a superior Castilian army at Aljubarrota on 14th August, and in the following October the Holy Constable destroyed another army at Valverde. These blows greatly weakened the prestige of Castile and increased that of Portugal, and when John of Gaunt arrived the following year with 2000 lances and 3000 archers the king of Castile sued for peace. King John of Portugal perceived the advantage of the friendship and alliance of England, and on 9th May 1386 was signed the treaty of Windsor, by which the two countries were to be allies for ever in every transaction. He drew the alliance still closer in 1387 by marrying Philippa of Lancaster, a daughter of John of Gaunt by his second marriage; and a truce was made between Portugal and Castile, and renewed at intervals until a final peace was signed in 1411. The only attempt made to disturb King John I. was an incursion by the eldest son of Ines de Castro, Dom Diniz, in 1398, assisted by Henry III. of Castile, but the legitimate claims of the prince carried no weight against the conqueror of Aljubarrota, and he retired discomfited. The long reign of John I. was, like that of King Diniz, a reign of peaceful development: Diniz had settled and united the country after the Moorish wars; John did the same after the obstinate war with Castile, and at the end of his reign saw Portugal beginning to expand beyond the sea. The keystones of his foreign policy were friendship with England and peace with Castile. Henry IV., Henry V., and Henry VI. of England all successively ratified the treaty of Windsor; Richard II. sent troops to help King John against Dom Diniz in 1398; Henry IV. made him a knight of the Garter in 1400; and Henry V. sent him help in the expedition to Ceuta in 1415. John's internal government was not so happy, for, though personally a clever administrator, he had had, in order to maintain himself when he claimed the crown, to grant vast privileges and estates to the nobles, who became more and more powerful, and, by their exercise of full feudal rights, almost independent. It was at the earnest request of his three elder sons, Dom Duarte or Edward, Dom Pedro, and Dom Henry, that he consented to invade Africa in 1415. The young princes desired to win their knightly spurs; there were no enemies at home; and what could be more proper than to attack the old hereditary foes of Portugal, the Moors, in Morocco itself? The queen from her death-bed sent her blessing; the princes proved themselves worthy sons of their father; and by the occupation of Ceuta the

Portuguese made their first conquest beyond the limits of their country. The expedition over, the elder princes each followed his own bent: Dom Edward assisted his father in the labours of government; Dom Pedro, who was made duke of Coimbra, travelled throughout Europe, and showed himself everywhere a learned and accomplished as well as brave knight; and Dom Henry, who was master of the Order of Christ, governor of Algarves, and duke of Viséu, established himself at Sagres, and devoted his life to the encouragement of maritime exploration, for an account of which see vol. x. pp. 179, 180. Portuguese discoveries thus made illustrious the closing years of the reign of King John, who died in 1433.

Contrary to expectation, the reign of King Edward (so Edward, called after Edward III. of England) proved, in spite of his own great qualities, but short, and was marked by one signal disaster. On ascending the throne he summoned a full cortes at Evora and secured the passing of the *Lei Mental*, or the provision which was supposed to be in the mind of King John when he gave his extensive grants to the nobility, namely, that they could only descend in the direct male line and on failure should revert to the crown. By this means Edward hoped to check the excessive power of the nobles, many of whom fled to Castile. He supported his father's policy, married a princess of Aragon, and, after confirming the treaty of Windsor, was made a knight of the Garter in his father's room. He also encouraged the explorations of Dom Henry; but the king's life was shortened and Dom Henry's explorations were checked for a time by the fatal expedition to Tangiers in 1436. At the earnest request of his youngest brother Dom Ferdinand and of Dom Henry himself, and in spite of the remonstrances of the pope and Dom Pedro, the king sent a fleet to attack Tangiers; the army was cut off, and it was only by sacrificing Dom Ferdinand as a hostage that the troops were allowed to retire to their ships. The imprisonment of his brother preyed on King Edward's mind, and he died in 1438, while Dom Ferdinand, after a long and cruel captivity at Fez, borne with such exemplary piety as to win him the title of "the Constant Prince," died from ill-treatment in 1443.

The new king, Affonso V., was a minor, and his reign Affonso began with a struggle for the regency between his mother, Donna Leonora, and his uncle, Dom Pedro, duke of Coimbra. The people of Lisbon supported the latter, who was recognized as regent; and his conduct justified the choice. He pursued his brother's policy of curbing the pretensions of the nobles, and encouraged Dom Henry's work of discovery, which advanced every year. Dom Pedro's power was seemingly at its height in 1447 when Affonso V. was declared of age and at the same time married his cousin Leonora, daughter of Dom Pedro; but the duke of Braganza poisoned the king's mind against his uncle, and schemed his dismissal from court. Then, not satisfied with this, he marched against him with a royal army, largely recruited by the nobility, who hated the duke of Coimbra. The two forces met at Alfarrobeira on 20th May 1449, when the regent was slain, to the great regret of the Portuguese people. The young king fell more and more under the influence of the duke of Braganza and his sons, who humoured his desire for knightly fame and his dream of sitting on the throne of Castile, and who secured to themselves vast grants of royal property. This knightly idea appears in Affonso's three expeditions to Africa, which won him the surname of "the African": in 1458 he took Alcácer Seguer; in 1461 he failed; and in 1471 he took Arzila and Tangiers. Meanwhile maritime exploration went on apace; but in 1460 Dom Henry the Navigator, the heart and soul of these maritime enterprises, died. The "Ré Cavalleiro" or knightly

John I.

king was now bent on the old chimerical scheme of winning Castile; for that purpose he married in 1475 his own niece, the infanta Joanna, only daughter of Henry IV. of Castile, and claimed the kingdom; but the Castilians preferred the infanta Isabella, who had married Ferdinand, king of Aragon. The rival parties took up arms; and the king of Portugal was utterly defeated at Toro in 1476, which sent him hurriedly to France to beg help from Louis XI.; but his mission was in vain, and he saw no alternative save signing the treaty of Alcantara (1478), by which his newly-won wife was sent to a convent. He remained inconsolable at his loss, and alternately abdicated and returned until his death in 1481.

John II. His successor, John II., was a monarch of a very different type: though he had proved himself a brave and valiant soldier at the battle of Toro, he pursued the old policy of the house of Aviz, that of peace and family alliances with Castile and of commercial intimacy with England. But he was also a typical king of this period, and followed the example of Louis XI. in France and Henry VII. in England in breaking the power of the nobles, with the hearty acquiescence of the people. Besides political reasons for this policy, he remembered that he was the grandson of the great duke of Coimbra, and bound to revenge his murder at Alfarrobeira. The first act of his reign was to summon a full cortes at Evora, at which it was decreed that the royal corregidores should have full right to administer justice in all the feudal dominions of the nobility. This act brought him of course into direct conflict with the nobility, who were headed by Ferdinand, duke of Braganza, to the king's great delight, for, as he said, the wanton liberality of his father had left him only the high roads of Portugal for his inheritance. Hence the duke of Braganza was naturally the first object of the king's attack. He was the wealthiest nobleman not only in Portugal but in the whole Peninsula; his brothers held the high offices of constable and chancellor of the kingdom, and they too had all assisted in the overthrow of the duke of Coimbra. He believed himself to be safe because he and the king had married sisters, but he was promptly arrested for high treason, and after a very short trial executed at Evora on 22d June 1483. His own and the king's brother-in-law, Ferdinand, duke of Viseu, a grandson of King Edward, succeeded to the leadership of the nobles; but John II., imitating Louis XI.'s policy of not sparing his own family, stabbed him with his own hand at Setubal on 23d August 1484, and afterwards executed some eighty of the leading nobles, breaking the feudal power of the class for ever. This terrible struggle over, he occupied himself with such success in administration that he won the surname of "the Perfect King." But he did not intend to keep the Portuguese in idleness. He was surrounded by the gallant knights who had been trained by his father, and who, though now frightened out of treason, yet needed some occupation, and at his court were the famous navigators trained by Dom Henry. In 1484 he built a fort at La Mina or Elmina to cover the increasing trade with the Gold Coast, and in 1486 Bartholomeu Dias rounded the Cape of Good Hope and reached Algoa Bay. The king was full of plans for reaching India and discovering Prester John; besides despatching a special expedition for this purpose in 1487, he sent Pedro de Evora and Gonçalo Annes to Timbuctoo, and Martim Lopes to Nova Zembla to find a north-east road to Cathay. With all his perspicacity, he made the great mistake of dismissing Columbus in 1493 as a visionary; but he was occupied to the very last day of his life in getting ready the fleet with which Vasco de Gama was to find out the passage to India by the Cape of Good Hope (see vol. x. p. 181 *sq.*). It was in his reign, in 1494, that

the pope issued his famous bull dividing the undiscovered parts of the world between Spaniards and Portuguese. A great sorrow darkened the later years of John II. in the death of his only son Affonso, who in 1490 had married Isabella, eldest daughter of Ferdinand and Isabella of Spain; and he himself died in the flower of his age in 1495.

The reign of Emmanuel "the Fortunate," brother of Emmanuel the murdered duke of Viseu, is the heroic period of Portuguese history. The great men and brave knights of the reigns of Affonso V. and John II. were still living, and Vasco de Gama, Francisco de Almeida, and Affonso de Albuquerque were to make their king's reign for ever glorious. Yet Emmanuel personally contributed but little to this glory; his one idea was to sit on the throne of Castile. To gain this end he proposed to marry Isabella, eldest daughter of Ferdinand and Isabella and widow of Dom Affonso, and to win her hand he consented to expel the Jews from Portugal, although they were the richest and most useful class of people in the kingdom, and had been faithfully protected ever since the days of Affonso Henriques. He married Isabella in 1497, and was on a progress through Spain in the following year for the purpose of being recognized as heir to the throne, when she died suddenly at Toledo, and with her disappeared his great hopes. Even then he did not despair, but in 1500 married his deceased wife's sister, Maria, though her elder sister Joanna was also married, and had a son, who was afterwards the emperor Charles V. While the king was thus occupied great things were being done in Asia by his subjects. In 1497 Vasco de Gama had crossed the Indian Ocean and reached Calicut; in 1500 Pedro Alvares Cabral discovered Brazil on his way to India; in 1502 Vasco de Gama paid his second visit to the Malabar coast; in 1503 Duarte Pacheco defended Cochin and with 900 Portuguese defeated an army of 50,000 natives; and in 1505 Francisco de Almeida was appointed first viceroy of India. This is not the place to dilate on the great deeds of ALBUQUERQUE (*q.v.*) and of the Portuguese in India; it is enough here to mark the dates of a few of the most important discoveries and feats of arms which illustrate the reign of Emmanuel. In 1501 João da Nova discovered the island of Ascension and Amerigo Vespucci the Rio Plata and Paraguay; in 1509 Diogo Lopes de Sequeira occupied Malacca; in 1510 Affonso de Albuquerque occupied Goa; in 1512 Francisco Senão discovered the Moluccas; in 1515 Lopes Soares built a fort at Colombo in the island of Ceylon; in 1517 Fernando Peres Andrada established himself at Canton, and made his way to Peking in 1521; and in 1520 Magalhães (Magellan), a Portuguese sailor, though in the Spanish service, passed through the straits which bear his name.

The reign of John III., who succeeded Emmanuel in John III. 1521, is one of rapid decline. The destruction of the feudal power of the nobility by John II. had not been an unmixed good: it had fatally weakened the class of leaders of the people; the nobility lost all sense of patriotism and intrigued for "moradias," or court posts; and, in short, their position was much the same as that of the French nobility before the Revolution of 1789. The overthrow of their power had also made the king absolute; having now no feudal nobility to combat, he had no need of the support of the people, and the newly-created Indian trade brought him an income greater than that of any prince in Europe, so that he had no need of taxes. There was, however, a more serious cause of the declining power of Portugal than the absolutism of the government, and that was the rapid depopulation of the country. Alemtejo and Algarves had never been thoroughly peopled; the devastation produced by constant war could not be easily repaired; and, though the exertions of Diniz the Labourer had made

Beira the garden of Europe, the southern part of the kingdom was chiefly in the hands of the military orders, who did not sufficiently encourage immigration. The great discoveries of the 15th century quickened the depopulation of Portugal. Not only did the bulk of the young men gladly volunteer as soldiers and sailors to go in search of wealth and honour, but whole families emigrated to Madeira and the Brazils. Also the Portuguese who did continue to live in their native country flocked to Lisbon, which trebled in population in less than eighty years, owing to the large fortunes which could be made there in trade. The king, the nobles, and the military orders were quite unconcerned at this extensive emigration, for their large estates were cultivated much more cheaply by African slaves, who were imported from the time of the first voyages of Dom Henry in such numbers that Algarves was entirely cultivated by them, and even in Lisbon itself they outnumbered the free-men by the middle of the 16th century. In this respect the condition of Portugal resembled that of Italy at the time of the decline of the Roman empire, as the wealth of Lisbon resembled that of imperial Rome, while in another respect the utter corruption of the officials in the factories and Indian settlements too far resembled the peculation and corruption of the Roman proconsuls. While the Portuguese nation was exhibiting these signs of a rapid decline, another factor was added by the religious zeal of John III. This king inherited his father's bigotry and fanaticism, and was anxious to introduce the Jesuits and the Inquisition into Portugal. The Church of Rome was not likely to hinder his pious desire, but for several years the "neo-Christians"—the name given to the half-hearted converts made from the Jews as the condition of their remaining in Portugal—managed to ward off the blow. But the king's earnest wish was gratified at last, and in 1536 the tribunal of the Holy Office was established in Portugal with the bishop of Ceuta as first grand inquisitor, who was soon succeeded by the king's brother, the cardinal Henry. The Inquisition quickly destroyed all that was left of the old Portuguese spirit, and so effectually stamped out the Portuguese revival of literature that, while towards the close of the 16th century all Europe was becoming civilized under the influence of the Renaissance, Portugal fell back and her literature became dumb. The king had his reward for his piety: he was permitted to unite the masterships of the orders of Christ, Santiago, and Aviz with the crown, and to found new bishoprics at Leiria, Miranda, and Porto Alegre; but it was left to St Francis Xavier to show the real beauty of Christianity in his mission to the Indies.

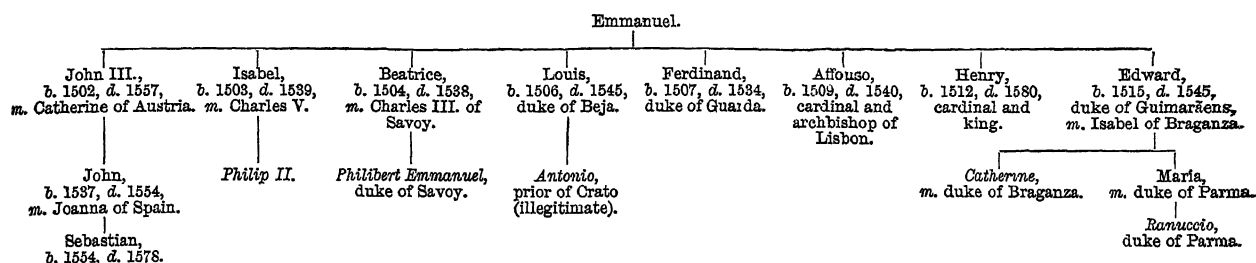

It was in India that the decline of the Portuguese was most perceptible. Nuno da Cunha, son of the discoverer Tristan da Cunha, governed the Indian settlements worthily till 1536, and then corruption undermined all prosperity until the arrival of Dom João de Castro in 1545. He was a Portuguese hero of the noblest type; and for three years the friend of St Francis Xavier revived the glories of Albuquerque by winning the battle of Diu, and then died in the missionary's arms. Everything went afterwards from bad to worse, till even observers like the Dutchman Cleynaerts saw that, in spite of all its wealth and seeming prosperity, the kingdom of Portugal was rotten at the core and could not last. King John III., satisfied with peace and the establishment of the Inquisition in his kingdom, did nothing to check the decline; and he endeavoured to secure his aims by the marriage of his only surviving son John to his niece Joanna, a daughter of Charles V., but he had the misfortune to outlive his son, who died in 1554. When he himself died in 1557 he left the crown to his grandson, a child of three years old, the ill-fated Dom Sebastian.

Nothing could be more disastrous for Portugal than the Sebastian succession of a minor at this juncture. Under the will of John III. the regency was assumed by Queen Catherine and the cardinal Henry, his widow and his brother, but all power was exercised by the brothers Luis and Martim Gonçalves Camara, of whom the former was the young king's tutor and confessor and the latter prime minister. In 1568 Dom Sebastian was declared of age by the Camaras, who thus excluded the cardinal from even a semblance of power. As the king came to take more interest in affairs, the mixture of imperiousness, fanaticism, and warlike ambition which made up his character began to make its mark upon his reign. He tried to check the luxury of his people by a sumptuary edict that no one might have more than two dishes for dinner; he encouraged the Inquisition; and he dreamt of a new crusade in Africa for the conquest and conversion of the Moors. His crusading ardour was most objectionable to his people, who had highly approved of John III.'s surrender of all ports in Africa except Ceuta, Tangiers, Arzilla, and Mazagan, but the Jesuits and young courtiers about his person encouraged him in his wild ideas. In 1574 he paid a short visit to Ceuta and Tangiers, and in 1576, to his great delight, Mouley Ahmed ibn 'Abdalláh, after being disappointed in his application to Philip II. for help against Mouley 'Abd al-Melik, sultan of Morocco, applied to Sebastian. The king proceeded to raise money by harsh taxes on the converted Jews and by partial bankruptcy, and set sail for Africa on 24th June 1578 with 15,000 infantry, 2400 cavalry, and 36 guns; of this army only some 10,000 were Portuguese, the rest consisting of Spanish and German volunteers and mercenaries, and 900 Italians, under Sir Thomas Stukeley, whom, when on his way to deliver Ireland from Elizabeth, Sebastian had stopped. On reaching Africa the Portuguese king was joined by Mouley Ahmed with 800 Mohammedans. He at first amused himself with hunting, and then, just as Dom Ferdinand had done in 1436, he foolishly left his base of operations, his fleet, and the sea, and began to march over the desert to attack Larash (El-Araish). Mouley 'Abd al-Melik, who had previously endeavoured to dissuade the young king from his purpose, collected an army of 40,000 cavalry, 15,000 infantry, and 40 guns, and, feeling that he was himself on the point of death from a mortal disease, ordered an instant attack upon the Portuguese at Alcácer Quibir, or Al-ḡaṣr al-Kebír, on 4th August 1578. Dom Sebastian behaved like a brave knight, though he had not been a prudent commander, and when all was lost he was determined to lose his own life also. According to the most trustworthy account, Christovão de Tavora, his equerry, had shown a flag of truce, and had offered to surrender with the fifty horsemen who still remained about the king, when Sebastian suddenly dashed on the Moorish cavalry, who, irritated by this breach of faith, instantly slew him and the brave equerry who had followed his master. The slaughter was terrible; Mouley 'Abd al-Melik died during the action; Mouley Ahmed was drowned; Sir Thomas Stukeley was killed, with many of the chief Portuguese nobles and prelates, including Don Jayme de Braganza (brother of the sixth duke of Braganza), the duke of Aveiro (who had commanded the cavalry), and the bishops of Coimbra and Oporto, while among the prisoners were the duke of Barcellos and Duarte de Menezes. The sad news was brought to Lisbon by the admiral of the fleet, Dom Diogo de Sousa, and the cardinal Henry was proclaimed king of Portugal Henry I. as King Henry I.

Hardly had the new king been crowned when intrigues began about his successor. He could not live long; but he determined not to examine the question himself, and so summoned a cortes at Lisbon at once to decide it. Of

the seven candidates only five need be seriously considered, for Pope Gregory XIII., who claimed as heir-general to a cardinal, and Catherine de' Medici, who claimed through Affonso

III. and his first wife, the countess of Boulogne, require no further notice; the relationship of the other five to Emmanuel can be best perceived from the following table:—

It clearly appears that the heiress to the throne was Catherine, duchess of Braganza, and failing her heirs the duke of Parma, and that the claims of Philip II. and of the duke of Savoy were only valid in case of the extinction of the line of Dom Edward. Yet, though the university of Coimbra declared in favour of the duchess of Braganza, Philip II. set to work to win over the majority of the cortes. Money and lavish promises assisted the eloquence of his two chief supporters, Christovão de Moura and Antonio Pinheiro, bishop of Leiria; and when the cardinal-king died on 31st January 1580 the cortes was quite ready to recognize Philip, although the people, or rather that small portion of the inhabitants who were really Portuguese, felt their old disinclination towards the union of Spain and Portugal. Philip prevented any movement on the part of the duke of Braganza by promising him Brazil with the title of king, and a marriage between the prince of the Asturias and his daughter, which, as the duke hated war and loved ease, were readily accepted; but to Philip's surprise a competitor whom he had taken no account of, Antonio, the prior of Crato, declared himself king at Santarem, and then entered Lisbon and struck money. Portugal, however, enervated by wealth, oppressed by the Inquisition, and reduced in free population, felt no inclination to make a powerful stand against Philip, who had all the prestige of being the son of Charles V., while the hot-headed but incapable prior of Crato could not be compared to the great John I.; and the cortes, which had in 1385, under the honeyed words of João das Regras, enthusiastically fought for Portugal, in 1580 listened to the promises of Christovão de Moura and rejected the prior of Crato. The duke of Alva entered Portugal at the head of a Spanish army and easily defeated Dom Antonio at Alcantara, after which Philip was declared king of Portugal.

The other candidates were obliged to acquiesce in Philip's success; the duke of Braganza, though greatly disappointed at receiving only the office of constable and the order of the Golden Fleece instead of the whole of Brazil, was, like the majority of his countrymen, too apathetic to strike a blow. Philip pledged himself to recognize the individuality of Portugal in a cortes held at Thomar in 1581, when he promised that he would maintain the rights and liberties of the people, that the cortes should be assembled frequently, that all the offices in the realm should be given to Portuguese alone, that no lands or jurisdiction in Portugal should be given to foreigners, and that there should be a Portuguese council, which should accompany the king everywhere and have entire charge of all Portuguese affairs. But the lower classes refused to believe that Dom Sebastian was dead,—a belief encouraged by the stratagem of a wounded noble on the evening of the battle of Al-kasr al-Kebir to gain admission into the city of Tangiers by asserting that he was the king; and four successive impostors arose, who assumed the name of the dead monarch. The first two, who were mockingly called the "king of Pennamacor" and the "king of Ericeira,"

were Portuguese of low birth, who were recognized by a few people in the vicinity of their native villages, and easily captured in 1584 and 1585; the third, Gabriel Espinosa, was given out as Dom Sebastian's Portuguese Jesuit, and introduced as such to Donna Anna, a natural daughter of Don John of Austria, who believed in him, but he was executed in 1594; while the fourth, a poor Calabrian named Marco Tullio, who could not speak a word of Portuguese, asserted his pretensions at Venice as late as 1603, twenty-five years after Dom Sebastian's death, and, after obtaining some success in Italy, was also captured, sent to the galleys, and afterwards executed. Of more importance were the renewed attempts of the prior of Crato to assert his claims with the assistance of foreign allies. In 1582 he proceeded to the Azores with a strong French fleet under Philip Strozzi, but his ill-fortune followed him: Strozzi was defeated and killed in a battle with the Spanish admiral Don Alvaro de Bacam, and Dom Antonio fled to England. There Elizabeth received him kindly, and in 1589 she sent a strong fleet under Drake and Norris to help him win back his "kingdom"; but Drake and Norris quarrelled, Portugal showed no willingness to receive him, nothing was done, and the English retired. The unfortunate prior, finding that Elizabeth would do nothing more for him, again returned to Paris, where he died in poverty in 1594.

"The sixty years' captivity," as the domination of Spain over Portugal from 1580 to 1640 is called, was a time of disaster for the country: not only did the English sack Faro in 1595, but Dutch, English, and French all preyed upon its great colonial possessions; the Dutch in particular, after beating the Portuguese in India, took from them the greater part of the lucrative Indian trade. This they did with the more ease since, with the true commercial spirit, they not only imported merchandise from the East to Holland but also distributed it through Dutch merchants to every country of Europe, whereas the Portuguese in the days of their commercial monopoly were satisfied with bringing over the commodities to Lisbon, and letting foreign nations come to fetch them. The Dutch incursion into the Indies was directly caused by Philip's closing the port of Lisbon to them in 1594; and in 1595 Cornelius Houtman, a Dutchman, who had been employed by the Portuguese as an Indian pilot and then imprisoned by the Inquisition, offered to lead a Dutch fleet to the Indies, and in 1597 they erected a factory in Java. They speedily extended their sphere of operations by occupying the Moluccas and Sumatra, and in 1619 they built Batavia as a rival commercial capital in the East to Goa. The English quickly followed their example; in the reign of Elizabeth the English captains had been content to ravage Pernambuco in 1594-95, Fort Arguin in 1595, and the Azores in 1596, and in the reign of James I. the East India Company was established in the Indies at Surat. The French also settled themselves in Brazil and opened a flourishing trade with South America and the

west coast of Africa; and even the Danes struck a blow against the monopoly of the Portuguese by building a factory at Tranquebar. To make up for these losses, what had Portugal received from Spain? The promises made to the cortes at Thomar were all broken; the cortes was only summoned once in 1619 to recognize Philip, the eldest son of King Philip III., as the heir to the throne on the occasion of his only visit to Lisbon; Lerma and Olivares, the all-powerful ministers of Philip III. and Philip IV., appropriated to themselves large territories within the realm of Portugal; and, whenever it was possible, Spaniards were installed in Portuguese bishoprics and civil offices.

At last a blow was struck against this supremacy of Spain in the revolution of 1640 and the elevation of the house of Braganza to the throne of Portugal. Things had been tending towards a revolution for a long time, but the final impulse came from the energy of certain noblemen, conjoined with the weakness of Spain and the hope of assistance from France.

Revolt of Portuguese. The general discontent was shown by risings in Lisbon in 1634 and in Evora in 1637, where for a short time the mob ruled the city; and, when Spain was hampered by the Catalan revolt and the French war, the opportunity seemed favourable for the Portuguese. The difficulty was to find a leader; the eighth duke of Braganza, grandson of the infanta Catherine, daughter of Dom Edward, was a pleasure-loving, easy-tempered man, fond of music and hunting, quite happy in his palace at Villa Viçosa; but the energy of his wife, Luiza de Guzman, Castilian though she was, secured his passive co-operation, and his confidential adviser, João Pinto Ribeiro, soon formed a powerful band of conspirators among the Portuguese noblemen, when the news arrived in 1640 that the *arrière-ban* of Portugal was summoned to fight against the Catalans. Portugal was at that time under the nominal government of Margaret of Savoy, duchess of Mantua, who was surrounded with Spaniards and Italians; but the real government was in the hands of the tyrannical secretary of state, Miguel de Vasconcellos de Brito. Ribeiro had no difficulty in collecting together many daring and discontented noblemen, of whom the chief were Miguel de Almeida, Pedro de Mendonça Furtado, Antonio and Luis de Almada, Estevão and Luis da Cunha, Rodrigo and Emmanuel de Sá, and Jorge de Mello; and the archbishop of Lisbon himself, Rodrigo da Cunha, if not actually a conspirator, certainly must have had a knowledge of what was going on through his relatives the *Almadas* and *Da Cunhas*. The plot was carefully elaborated, parts being assigned to the leading conspirators, and the day fixed was the 1st of December. The plot was completely successful; the archbishop of Lisbon was appointed lieutenant-general of the kingdom, with Almeida, Mendonça, and A. de Almada for councillors, and expresses were sent off to the duke of Braganza to inform him of all that had passed and to offer him the crown. He was at first unwilling to accept the honour thrust upon him, but the duchess, on whom a prophecy that she should be a queen had had a great effect, persuaded him to go to Lisbon, where he was crowned as King John IV. on 13th December 1640. The whole of Portugal at once rose and expelled the Spaniards, and on 19th January a full cortes met at Lisbon, which recognized King John as king of Portugal, and his son Theodosius as heir-apparent.

The Portuguese knew well that, in spite of the Catalan rebellion and the terrible wars in which Spain was engaged, they were not strong enough to maintain their independence without foreign help, and at once sent ambassadors to France, Holland, and England. Richelieu was charmed with the success of the revolution, hoping to make Portugal

a thorn in the side of Spain, such as Scotland had been to England in former days, and he at once sent a fleet under De Brezé to the Tagus; the Dutch also sent a fleet under Gylfels; but Charles I. of England was too much occupied with his quarrels with his parliament to do more than merely recognize the new king.

The Portuguese were at first successful, owing to the many wars in which Spain was involved, and, after the defeat which Mathias de Albuquerque inflicted on the baron of Molingen at Montijo on 26th May 1644, felt at their ease in spite of the serious plot of the duke of Caminha and the archbishop of Braga, until it became obvious that Mazarin would desert them without compunction if it suited his purpose. The old Portuguese colonies at once declared for their fatherland, and this brought about a colonial war with Holland, in which indeed the Portuguese generals won many successes, but which deprived them of the assistance of the Dutch in Europe. Mazarin's refusal to insist on their independence at the congress at Münster, though he protected their envoys against the Spaniards, made them despondent; and a very curious letter of Mazarin's (4th October 1647), offering the crown of Portugal to the duke of Longueville, exhibits at once the feeble character of John IV., the despair of the Portuguese, and their dependence on France. Mazarin's desertion did not at first do great harm, for the war between France and Spain continued, though peace was made with the empire. In the midst of this universal war John IV. died in 1656.

As the prince of Brazil, Dom Theodosio, the eldest son of Affonso the late king, had predeceased him, his second son Affonso VI. a boy of thirteen, succeeded to the throne as Affonso VI. under the regency of his mother. The queen-regent, who had always been more energetic than her husband, determined to pursue the war with Spain with more vigour and summoned Marshal Schomberg to organize her armies. The result of Schomberg's presence soon appeared, and on 14th January 1659 Dom Antonio Luis de Menezes, count of Cantanhede, won a victory over Don Luiz de Haro at Elvas. This victory in one way injured the Portuguese cause, for it so incensed Don Luiz de Haro that, during the famous conferences at the Island of Pheasants with Mazarin which led to the signature of the treaty of the Pyrenees in 1659, he not only would not hear of any intercession for the Portuguese but insisted on the insertion of a secret article in the treaty to the effect that France would promise to entirely abandon them. Neither Mazarin nor Louis XIV. intended to keep this secret article and give up the advantage of having such a useful ally in the Peninsula, and they accordingly looked about for some means to evade it. England offered the opportunity; Charles II. was seeking a wife and gladly accepted the suggestion that he should marry Catherine of Braganza, sister of the king of Portugal, both because Portugal had sheltered his cousins Prince Rupert and Prince Maurice in 1650, and because the colonial sessions which the queen-regent offered as her daughter's dowry would be very popular in England. The marriage was accordingly agreed upon in 1661, and in 1662 the earl of Sandwich came to bring the bride from Lisbon, while the English occupied Tangiers, Bombay, and Galle as her dowry, and promised to send troops to Portugal, and to make peace between the Dutch and the Portuguese. Before, however, the English soldiers arrived and the final struggle with Spain began, a family revolution had taken place in Portugal. The young king, a feeble vicious youth, was very wroth that his mother had exiled a favourite valet to the Brazils, and by the advice of two noblemen about his person suddenly declared himself of age in 1662 and transferred the government to the able hands of Luis de Sousa e

Vasconcellos, count of Castel Melhor. The queen retired to a convent chagrined, but Castel Melhor continued her policy, and formed the English soldiers, who had arrived under the earl of Inchiquin, some French and German volunteers and mercenaries, and the newly-organized Portuguese levies into a powerful army, of which Schomberg was the real, though not the ostensible, commander. With this army a series of victories were won, which caused Affonso VI. to be surnamed "Affonso the Victorious," though his own successes, such as they were, were confined to the streets of Lisbon. On 8th June 1663 the count of Villa Flor with Schomberg by his side utterly defeated Don John of Austria, and afterwards retook Evora; on 7th July 1664 Pedro Jacques de Magalhães defeated the duke of Ossuna at Ciudad Rodrigo; on 17th June 1665 the marquis of Marialva destroyed a Spanish army under the marquis of Carracena at the battle of Montes Claros, and Christovão de Brito Pereira followed up this victory with one at Villa Viçosa. These successes entirely broke the power of Spain, and peace was only a matter of time, when Castel Melhor decided to increase both his own power and that of Portugal by marrying the king to a French princess. Such an alliance was highly approved of by Louis XIV., and the bride selected was Marie Françoise Elisabeth, Mademoiselle d'Aumale, daughter of the duke of Savoy-Nemours and granddaughter of Henry IV. of France. The marriage was celebrated in 1666; but Castel Melhor found that, instead of increasing his power, it worked his ruin. The young queen detested her husband, and fell in love with his brother Dom Pedro; and after fourteen months of a hated union she left the palace and applied for a divorce on the ground of non-consummation to the chapter of the cathedral-church of Lisbon, while Dom Pedro shut up King Affonso in a portion of the palace and assumed the regency. He was recognized as regent by the cortes on 1st January 1668, and at once signed a peace with Spain on 13th February, by which the independence of Portugal was recognized in return for the cession of Ceuta. This peace, signed at Lisbon, was chiefly negotiated by the earl of Sandwich and Sir Richard Southwell, the English ambassadors at Madrid and Lisbon. On 24th March the queen's divorce was pronounced and confirmed by the pope, and on 2d April she married the regent. His rule was gladly submitted to, for the people of Portugal recognized his sterling qualities, which compared favourably with those of the unfortunate Affonso VI. Castel Melhor fled to France, and the king—for Dom Pedro only called himself "regent"—was imprisoned, first in the island of Terceira and then at Cintra, till his death in 1683, the very same year in which the queen also died.

Pedro II. As long as Affonso VI. lived, Dom Pedro's power was not thoroughly established, but in 1683 he was proclaimed king as Pedro II. His reign was marked by good internal administration, the breaking out of the War of the Spanish Succession, and the Methuen treaty. His good administration kept him from being short of money, and enabled him to dispense with the cortes, which never met between 1697 and 1828; but the war of the succession almost emptied his treasury. He had in 1687, at the earnest request of the duke of Cadaval, his most intimate friend, consented to marry again in order to have an heir, and had selected Maria Sophia de Neuburg, daughter of the elector palatine, rather to the chagrin of Louis XIV., who, in the prospect of the death of Charles II. of Spain, had counted on the support of Pedro's first wife, a French princess, and who now sought to form a strong party at the court of Lisbon. He was so far successful that on the death of Charles II. King Pedro not only recognized Louis XIV.'s grandson as Philip V. of Spain but in 1701 protected a

French fleet in the Tagus under the count of Chastenuau against Sir George Rooke. The great Whig ministry of England was not likely to submit to this desertion on the part of England's ancient ally, and sent the Right Honourable John Methuen in 1703 to Lisbon with full powers to make a treaty, both political and commercial, with Portugal. On 27th December 1703 he signed the famous Methuen treaty, by which Portuguese wines were to be imported into England at a lower duty than those from France or Germany, in return for a similar concession to English textile fabrics. The immediate result was that Pedro acknowledged the archduke Charles, and the ulterior that Englishmen drank port wine instead of claret or hock throughout the last century, while the Portuguese imported nearly everything they wanted from England and remained without manufactures. On 7th March 1704 Sir George Rooke arrived at Lisbon, conveying 10,000 English troops under Lord Galway and the archduke Charles himself. The English army at once advanced with a Portuguese auxiliary force and took Salvaterra and Valença. In the following year but little was done on the Portuguese frontier, because the archduke had sailed round to Barcelona, and Dom Pedro, who was slowly dying, handed over the regency to his sister Catherine, queen-dowager of England. Had he been conscious he might have learned of the great successes of the allied army under João de Sousa, marquis das Minas, and Lord Galway, who in rapid succession took Alcantara, Coria, Truxillo, Placencia, Ciudad Rodrigo, and Avila, and even for a short time occupied Madrid, and of their equally rapid retreat; he never recovered sufficiently, however, to know of these movements; he gradually sank, and died at Alcantara on 9th December 1706.

The long reign of John V., who assumed the royal John V. state at once from the regent Catherine, resembles the reign of John III. At its commencement he left the power in the hands of his father's friend, the duke of Cadaval, who continued Dom Pedro's policy and prosecuted the war against Philip V. Cadaval bound the king more surely to the Anglo-Austrian party by marrying him to the archduchess Marianna, daughter of the deceased emperor Leopold I., who was escorted to Lisbon by an English fleet under Admiral Byng in 1708. Yet the war itself did not go favourably for the allies in Spain, for the Spaniards had become enthusiastic partisans of Philip V.; and in 1709 a Portuguese army under the marquis of Fronteira was beaten at Caia, while in 1711 Duguay Trouin took and sacked Rio de Janeiro, afterwards the capital of Brazil. The war languished all over Europe after the accession of the archduke Charles to the empire, and on 6th February 1715, nearly two years after the treaty of Utrecht, peace was signed between Portugal and Spain at Madrid by the secretary of state, Lopes Furtado de Mondonça, count of Côte-Real. The king, as soon as he began to pay more attention to affairs, exhibited his attachment to the papacy, and in 1717 sent a fleet at the pope's bidding on a crusade against the Turks, which won a naval victory off Cape Matapan. The king declined to join the war against Alberoni, and disclosed a tendency to imitate Louis XIV., especially in building. The only indication of policy he showed was his determination to maintain peace by a close alliance with Spain: his daughter Maria Barbara was married to the infant Don Ferdinand, eldest son of Philip V., who succeeded to the throne of Spain as Ferdinand VI., while the Spanish infanta Marianna was married to the Portuguese heir-apparent, Dom Joseph. The enormous sums of money which John V. lent to the pope, to the real impoverishment of his country, brought him rewards which were of no real value, but which were such as he highly esteemed; namely, the archbishopric of

Lisbon was erected into a patriarchate, and the title of "Fidelissimus" or "Most-Faithful" was conferred upon the kings of Portugal, to correspond with those of "Most Christian" and "Most Catholic" attributed to the kings of France and Spain respectively.

Joseph.

Joseph, who succeeded his father in 1750, had the merit of perceiving the pre-eminent powers of Sebastião de Carvalho, who governed Portugal throughout this reign, and who, under his title of the marquis of Pombal (see POMBAL), ranks among the very greatest of 18th-century statesmen. In everything—in his great internal and administrative reforms, in his financial reforms, in the reorganization of the army, in the abolition of slavery, and in the great struggle with the Jesuits—Joseph supported his minister. Pombal made the king more absolute than ever, and exalted the royal prerogative while using it for purposes of reform; and in return the king maintained Pombal in power in spite of the violent protests of the priests and the opposition of his wife. Circumstances greatly helped the minister to establish an ascendancy over the king's mind: his conduct at the time of the great earthquake on 1st November 1755 secured him his high position over the other two secretaries of state; the Tavora plot gave him the influence which enabled him to overthrow the Jesuits in 1759; and the second attempt on the king's life in 1769 strengthened his hands in his negotiations with Rome and ensured the suppression of the order in 1773. The only war in which Portugal was engaged during this reign was caused by the close alliance with England, for, when Choiseul made the Family Compact and Spain entered upon the Seven Years' War, a Spanish army under the marquis of Sarria invaded Portugal and took Braganza and Almeida in 1762. Pombal immediately applied to England for help, when the count of Lippe-Bückeburg came over with a body of English troops and set to work to organize the Portuguese army; and, mainly owing to the brilliant services of Brigadier-General Burgoyne, the Spaniards were defeated at Valencia de Alcantara and Villa Velha, and peace was made on 10th February 1763. The close of the reign was disturbed by disputes with Spain as to the possession of Sacramento in South America, which were still unsettled when King Joseph died on 20th February 1777, leaving four daughters, of whom the eldest, Donna Maria Francisca, had married the king's brother, Dom Pedro.

Maria I.
and
Pedro
III.

The accession of Donna Maria was the signal for the overthrow of the great marquis and the reversal of his policy. The new queen was a weak woman, and her husband, Dom Pedro, who was proclaimed king, was a weak man; coins were struck in the names of Pedro III. and Maria I., but both sovereigns were ruled by the queen-dowager, who hated Pombal, and eventually sentenced him never to come within twenty leagues of the court. The incapacity of his successor soon became manifest, while the queen, who was completely under the sway of her confessor, Dom Ignacio de San Caetano, found her greatest happiness in raising and sending large sums of money to the Latin convent at Jerusalem. Such was the state of Portugal when the great crisis in the world's history caused by the French Revolution was at hand; and, when in 1792 it became evident that affairs could no longer go on in this haphazard fashion, it was also evident that the queen was no longer fit even for the slight fatigue she had to undergo. Her brain had given way in 1788, after the successive deaths of her husband, of her eldest son Dom Joseph, who had married his aunt, Donna Maria Benedicta, and of her confessor, and Dom John found it necessary to take the management of affairs into his own hands, though he was not actually declared regent until 1799.

About the time that Dom John became regent the wish to check the spread of the principles of the French Revolution, which were as much feared in Portugal as in all other Continental states, led to the great activity of Dom Diogo Ignacio de Pina Manique, the intendant-general of police. He eagerly hunted down all Portuguese gentlemen suspected of encouraging French principles or of being freemasons, expelled all Frenchmen from the kingdom, and kept a jealous eye on the American consul, Edward Church, and a merchant named Jacome Ratton, whom he declared to be at the head of a republican conspiracy. Moreover, the Portuguese ministers not only combated the dreaded French principles at home, they also believed it a holy duty to join in the general war against France, and therefore a corps of 5000 men was sent into the eastern Pyrenees to serve under General John Forbes Skelater, and four ships under the marquis of Niza joined the English fleet in the Mediterranean. The Portuguese force under Forbes Skelater served in all the actions in the eastern Pyrenees, shared in the successes of General Ricardos, and in the defeats of the count de la Union and General Urrutia; but nevertheless the Spanish Government, then under the influence of Godoy, the Prince of the Peace, did not hesitate to desert Portugal and make a separate peace with the French republic at Basel in July 1795. This naturally drove Portugal into a still closer alliance with England; and, when, after the treaty of San Ildefonso (1796), by which Spain declared war against England, and the secret convention between Pérignon and Godoy to divide Portugal between them, Spanish troops were massed on the Portuguese frontiers, an urgent supplication for help was sent to England. In response the House of Commons voted Portugal a subsidy of £200,000; a force of 6000 men was despatched under Major-General Sir Charles Stuart, which deterred the Spaniards from attempting an invasion; and the prince of Waldeck, like the count of Lippe in former days, was sent to reorganize the Portuguese army. Yet the English party was not strong enough to carry the day entirely; Sir Charles Stuart was soon withdrawn, and an effort made to secure peace with France through the mediation of Spain. But the concessions of the French party were of no avail; the First Consul was as violently opposed to Portugal, as being a province of England, as the Convention and Directory had been, and in 1800 Lucien Bonaparte was sent to Madrid with instructions from his brother to insist on the abandonment of the English alliance, on the opening of Portuguese ports to France and the closing of them to England, on the extension of French Guiana to the Amazons, on the cession of a portion of Portugal to Spain, until the recovery from England of Trinidad, Port Mahon, and Malta, and on the payment of a large sum of money, and he was authorized to offer to Spain a corps of 15,000 Frenchmen if these hard terms were rejected. The Portuguese ministers did reject them, and immediately Leclerc's corps entered Spain. The campaign lasted but a few days. Olivenza and Campo Mayor fell into the hands of the Spaniards, who also won bloodless victories at Arronches and Flor da Rosa. Peace was made at Badajoz with Spain, by which Portugal ceded Olivenza, and at Paris with France, by which it consented to the extension of French Guiana to the Amazons, and promised a large indemnity. Napoleon Bonaparte was anything but satisfied with the treaty of Badajoz, and received Lucien on his return with but little favour, for his aim was utterly to destroy Portugal as a nation; and it was with a full intention to excite her to war that he sent one of the roughest and least educated of his generals, Lannes, as ambassador to Lisbon. Lannes acted fully up to his chief's expectations: he ordered the dismissal of all the ministers who favoured England; and

The Pen-
insular
War.

was obeyed both from fear of France and from a dislike of England owing to her high-handed naval policy. Even this humble submission of the regent did not satisfy Napoleon, and in 1804 he replaced Lannes by Junot, whom he ordered to insist upon Portugal's declaring war against England. Then for a time he desisted from executing his plans against the country owing to his great campaigns in Europe, and made a treaty of neutrality with the Portuguese Government. At length in 1807, having beaten Austria, Prussia, and Russia, Napoleon again turned his thoughts to his project for the annihilation of Portugal, which had become more than ever a thorn in his side, since it refused to co-operate in his Continental schemes for ruining England. He resolved at first to act with Spain and Godoy, as Pérignon had done in 1797, and on 29th October 1807 signed the treaty of Fontainebleau, by which it was arranged that Portugal should be conquered and divided into three parts: the northern portion should be given to the king of Etruria in the place of his Italian kingdom, which Napoleon desired to annex, while the southern portion was to be formed into an independent kingdom for Godoy, and the central provinces were to be held by France until a general peace. The signature of the treaty was followed by immediate action: Junot moved with an army rapidly across Spain, and, together with a Spanish force under General Caraffa, entered Portugal from the centre, while General Taranco and General Solano with two other Spanish armies occupied the Minho and Alemtejo. With amazing rapidity Junot accomplished the march, and the Portuguese hardly knew that war was imminent until on 27th November Colonel Lecor rushed into Lisbon with the news that the French were in possession of Abrantes. This alarming intelligence unnerved the regent, who listened to the strongly-worded advice of Sir Sidney Smith, commander of the English ships in the Tagus, to abandon his kingdom for the Brazils, and leave the English to defend Portugal; and on 27th November Dom John, after naming a council of regency, went on board the English fleet with his whole family, including the queen Maria I. The English ships had hardly left the Tagus when a small force of wearied French soldiers, who were all that remained from the terrible fatigues of the march, entered Lisbon on 30th November.

Nothing proves more certainly the widely-spread existence of what were called French principles—that is to say, democratic ideas—in Portugal than the hearty reception which Junot met with from the first. At Santarém a deputation of the freemasons of Portugal, who were there, as in other Continental countries, a secret society for the propagation of democratic principles, welcomed him; the marquis of Alorna with the army instantly submitted to him; and the council of regency, knowing the temper of the citizens, made no attempt to hold Lisbon against him. But Junot showed no desire to grant the Portuguese a constitution, and after seizing all the money in the royal treasury he divided the country into military governments under his generals, issuing on 1st February a proclamation that the house of Braganza had ceased to reign. He then began to hope that he himself might succeed the Braganzas, and for this purpose sought to conciliate the Portuguese by reducing the requisition demanded by Napoleon from forty millions of francs to twenty millions, and commenced a negotiation with the radical or French party in Portugal through Luca de Scabra da Silva to induce them to send a petition or deputation to the emperor, asking for Junot to be their king. But his attempts at conciliation were of no avail; and, when the Spanish general Bellesta, who had succeeded Taranco at Oporto, seized the French governor, General Quesnel, declared for the regent, and marched into Galicia, Junot departed from Lisbon, leaving

the city in the hands of a regency, headed by the bishop of Oporto. The bishop at once sent to England for help, and encouraged fresh revolts all over the kingdom, till nearly every city in Portugal rose against the French and established its own junta of government. Meanwhile the English Government had willingly listened to the request of the bishop of Oporto, and ordered the small army which had been collected at Cork, under the command of Lieutenant-General Sir Arthur Wellesley, for an expedition to South America, to proceed to Portugal. Sir Arthur landed at the mouth of the Mondego river, advanced towards Lisbon, and, after defeating Laborde's division at Roliça on 17th August 1808, routed Junot himself at Vimieiro on 21st August. These victories were followed by the convention of Cintra, by which Junot agreed to vacate Portugal and give up all the fortresses in his possession; this convention, however disappointing from a military point of view, was eminently satisfactory to the Portuguese people, who saw themselves as speedily delivered from the French as they had been conquered by them. The regency was again established, and at once despatched Domingos Antonio de Sousa Coutinho, a brother of the count of Linhares, to London, to ask that an English minister with full powers should be sent to Lisbon, and that Sir Arthur Wellesley might be appointed to reorganize their army. Their requests were complied with: the Right Honourable J. C. Villiers was sent to Lisbon, and, as Sir Arthur Wellesley could not be spared, Major-General Beresford, who had learned Portuguese when governor of Madeira, which he had occupied in the preceding year, was sent to command their army. Portugal, however, was not yet safe from the French; Sir John Moore's advance to Salamanca and his retreat to Corunna had left the country but slightly garrisoned, and, in spite of the braggadocio of the bishop, Oporto quickly fell into the hands of Marshal Soult. Fortunately Soult, like Junot, was led away by the idea of becoming king of Portugal, and did not advance on Lisbon, thus giving time for Sir Arthur Wellesley again to arrive in the country with a powerful army. In the interval the Portuguese, in spite of some spirited fights by General Silveira, had shown how little they could do in their disorganized state, and the English Government determined to send out English officers to organize them and to take 10,000 Portuguese into English pay. Meanwhile Sir Arthur Wellesley had driven Soult from Oporto, had advanced into Spain, and won the battle of Talavera. From these successes of the English general it is pitiable to turn to the Portuguese regency. With the departure of the king all the able men of the royal party seemed to have left the country; the leaders of the radical party were either in disgrace or had fled to France; and none were left to compose the regency save a set of intriguers, whose chief idea was to get as much money from England as possible. The best part of the nation had entered the army, hence Marshal Beresford, aided by the adjutant-general Manuel de Brito Mousinho, soon organized a force which at Busaco proved itself worthy to fight beside the English soldiery. The regency got from bad to worse, till neither Beresford nor Wellington could work with it, and the English cabinet had to demand that Sir Charles Stuart (son of General Sir Charles Stuart), their ambassador at Lisbon, should receive a place upon it. His great ability and tact soon made him master, and a certain portion of the money sent by England to pay the Portuguese troops did then find its way to its proper destination. Yet the regency, even when thus strengthened, failed to make itself popular; and that there was a large radical party in Lisbon is sufficiently proved by the deportation of eighteen journalists to the Azores in September 1810. The troubles of Portugal were not yet over; the most formidable invasion

of all was to come. During the time of Masséna's campaign in Portugal the Portuguese showed the valour of a truly heroic nation. When Lord Wellington determined to retire to the lines of Torres Vedras, he commanded all the peasants to desert their fields and leave nothing for the French to subsist upon, and they obeyed him with touching fidelity. The Portuguese troops fully proved their value as soldiers when led and trained by such English generals as Pack and Ashworth, Bradford and John Hamilton, on every battlefield in the Peninsula and the south of France, and especially at Salamanca and the Nivelle. They well deserved the praise bestowed upon them by Wellington and Beresford, and the enthusiastic reception which they met with when they returned home in 1814.

John VI. Shortly after the conclusion of the war, in 1816, the mad queen Maria I. died, and the regent succeeded to the throne as King John VI. The English Government earnestly pressed him to return to Lisbon, where dissensions in the regency and the universal discontent urgently summoned him. But the new king was perpetually hampered by his intriguing and ambitious wife, Carlota Joaquina, who, in order to raise a party in her favour, had as early as 1805 promised a constitution to the Portuguese, and in 1812 had plotted to become independent queen of Brazil. The regency had become intensely unpopular, for Sir Charles Stuart and Marshal Beresford ruled despotically; and the mass of the people, who had been willing to endure the despotism of the English during the terrible war for existence, as well as the army, which had willingly obeyed the English officers on the field of battle, grew weary of foreign rule in time of peace and raised the cry of Portugal for the Portuguese. Directly after the war, in 1817, the first rising took place in Lisbon in the form of a *pronunciamento* of General Gomes Freire de Andrade, who had commanded the Portuguese contingent in the Russian campaign of 1812; but it was instantly and cruelly suppressed by Beresford and the regency, and the general and eleven others were executed. Yet the radical party was by no means conquered, and when Beresford went to Rio de Janeiro in 1820 advantage was taken of his absence by the people of Oporto, headed by certain officers in the garrison, to raise the cry for reform; the regency, unable to act without Beresford, gave way before a similar rising at Lisbon; the English officers were everywhere expelled; a new regency was proclaimed; Beresford was not allowed to land when he returned from Brazil; and a constituent assembly was summoned. The new assembly, consisting largely of men of the most radical opinions, at once abolished the Inquisition and the relics of feudalism, and proceeded to draw up an impracticable constitution, which showed that they had studied the glowing speeches of the men of the French Revolution and had not profited by a knowledge of their mistakes. Prussia, Austria, and Russia withdrew their ambassadors, and England insisted on John's returning to his kingdom. He accordingly left the Brazils to the government of his elder son Pedro, and set out for Portugal, where in 1822, at the earnest request of that son, he solemnly swore to obey the new constitution. He was at once met by the opposition of the queen and his younger son Dom Miguel, who refused to recognize the constitution; in consequence they were expelled from Lisbon. This event, with the invasion of Spain by the French to put down the rebellion of 1823, encouraged Francisco da Silveira, count of Amarante, to raise a *pronunciamento* in *Tras-os-Montes*; but the king at Lisbon declared, amid loud applause, that the constitution of 1822 was abrogated and his own absolutism restored, and he appointed the count of Palmella, the head of the English or constitutional party, to be his minister. But the absolutist party did not aim at a new form of constitutional

government; they were desirous to reinstate the old absolutism. The queen and Dom Miguel headed a new plot; the king's friend, the marquis of Loulé, was assassinated; Palmella was imprisoned and the king himself shut up in his palace. The united action of the foreign ministers who had remained in Lisbon freed the king; the new insurrection was suppressed; Palmella was again appointed minister; and the king, with the two chief conspirators, the queen and Dom Miguel, left Portugal once more for the Brazils. In the following year (1826) John VI. died, leaving by his will his daughter, the infanta Isabel Maria, as regent, to the great disappointment of Dom Miguel, who had returned to Portugal with the expectation of receiving it as his inheritance, while his brother Dom Pedro ruled in Brazil.

The next twenty-five years are the darkest in the whole history of Portugal and the most complicated to analyse, for the establishment of parliamentary government was no easy task; it is almost impossible to follow the rapid changes which succeeded each other, and quite impossible to understand the varying motives of the different statesmen and generals. The keynote to the whole series of the disturbances is to be found in the influence of the army. Beresford's creation was a grand fighting machine; but armies, and more particularly generals, are almost certain to intrigue in times of peace. On ascending the united thrones Dom Pedro IV. proceeded to draw up a charter containing the bases of a moderate parliamentary government and sent it over to Portugal by the English minister, Sir Charles Stuart, and then abdicated the crown of Portugal in favour of his daughter, Donna Maria da Gloria, a child only seven years old, on condition that she married his brother Dom Miguel, who was to recognize the new constitution. The charter was received with joy by the parliamentary party, and Palmella became prime minister; but in 1827 the king foolishly appointed Dom Miguel to be regent in Portugal. This ambitious prince was exceedingly popular with the old nobility, the army, and the poor; and, having declared himself absolute king, he drove the whole constitutional or chartist party—Palmella, Saldanha, Villa Flor, Sampaio, and their adherents—into exile. They fled to England, where the young queen then was, but, although they found popular opinion strongly in their favour, they found also that the duke of Wellington and his Tory ministry highly approved of Dom Miguel's behaviour, and that they persisted in confounding the moderate and the radical parties, and in believing that Palmella was a democrat. Meanwhile the reign of Dom Miguel had become a reign of terror, and a new movement was begun by the conjoined chartist and radical parties, who respectively advocated the charter of 1826 and the constitution of 1822, but who sank their differences to oppose Dom Miguel. The island of Terceira (Azores) had never submitted to this prince, and there in 1829 the marquis of Palmella, the count of Villa Flor, and José Antonio Guerreiro declared themselves regents for the young queen; and on 11th August 1830 they defeated in Praia Bay the fleet sent against them by Dom Miguel. This victory was the first ray of hope to the chartist party; all who could get away from Portugal hastened to the Azores; and in 1831 Dom Pedro, having resigned the imperial crown of Brazil to his infant son, came to London to join his daughter and prepare for a vigorous struggle against his brother. He met with acquiescence, if not encouragement, from the Liberal Government of Earl Grey, and managed to raise a large loan; then he betook himself with all the troops he could raise to the Azores, where he appointed the count of Villa Flor general-in-chief and Captain Sartorius of the English navy commander of the fleet. In July 1832 Dom Pedro arrived at Oporto with 7500 men, being enthusiastically welcomed

by the citizens; Dom Miguel instantly laid siege to the city. The siege was a terrible one; want within the walls and cholera among the besiegers decimated the armies, and the only real success gained was the victory of Sartorius over the fleet of Dom Miguel on 11th October. In 1833 more vigorous action began; Major-General João Carlos Saldanha de Oliveira e Daun, count of Saldanha, an old officer of Beresford's and a member of the Palmella Government in 1825, took the command in Oporto and beat off the French general Bourmont, who had been engaged by Dom Miguel to command his forces; the count of Villa Flor sailed from Oporto to Algarves, defeated General Telles Jordão, and after a triumphal march northwards occupied Lisbon; and Captain Charles Napier, who had succeeded Sartorius, destroyed Dom Miguel's fleet off Cape St Vincent in 1833. In this year Queen Maria came to Lisbon and was received with transports of delight, while Dom Pedro as regent again proclaimed the charter of 1826. The year 1834 was one of unbroken success for the chartists; England and France recognized the queen, and the Spanish ministry of Queen Isabella, knowing Dom Miguel to be a Carlist, sent two corps under Generals Rodil and Serrano to the help of Dom Pedro. Saldanha defeated the forces of the usurper at Torres Novas and Alamoster; Napier reduced Beira; Villa Flor, who had been made duke of Terceira, reduced Tras-os-Montes and won a victory at Asseiceira; Sá de Bandeira reduced Alemtejo; the combined Spanish and Portuguese armies surrounded the rest of Dom Miguel's adherents at Evora Monte; and Dom Miguel himself capitulated on 26th May. By the convention of Evora Monte the usurper, on condition of receiving a pension, promised to leave Portugal for ever; and the cortes at Lisbon not only declared him and his heirs ineligible for the throne but forbade them to return to Portugal under penalty of death. This same cortes attempted to arrange the finances, and abolished the orders of the friars, who had hitherto kept alive the party of rebellion in the villages, and finally, at Dom Pedro's request—for he felt his health failing—declared the queen of age on 18th September 1834. Dom Pedro, who had throughout been the heart and soul of his daughter's party, retired to Queluz (near Lisbon), where he died six days afterwards from the effects of his great labours and fatigues.

Maria II. The death of Dom Pedro deprived Queen Maria II., who was now only fifteen, of her greatest support, but a very strong ministry was formed, with the duke of Palmella as president and the duke of Terceira at the war office. Such a ministry might have lasted for a long time, but neither the queen, the nobility, nor the people understood the principles of real constitutional government, and the army was a constant source of danger. Members of different parties, while not conceiving that all alike loved Portugal, believed sincerely in their own opinions: the party in power proscribed and exiled its opponents, while the party in opposition invariably appealed to arms instead of seeking to obtain office by legitimate parliamentary means. In addition, the country was ravaged by bands of brigands, who called themselves "Miguelites," and who perpetually escaped into Spain when attacked in force; and, as each Government refused to recognize or pay interest upon the loans raised by its predecessors, the financial credit of Portugal soon fell to a very low ebb in the money markets of Europe. It is unprofitable to examine here the principles of the chief statesmen of the time as new Governments quickly succeeded each other; it will be sufficient to notice only the chief pronunciamentos and appeals to arms, and to remark the gradual approach to real parliamentary government. Queen Maria da Gloria's reign is one of violent party struggles, for they can hardly be called civil wars, so little did they involve, and that of

King Luis the reign of definite and peaceable parliamentary government. In her earlier years the queen was chiefly under the influence of her stepmother, the second wife of Dom Pedro, Amelia of Bavaria, and in 1835 she married the queen-dowager's brother, Augustus Charles Eugène Napoleon, duke of Leuchtenberg, second son of Eugène Beauharnais by the princess Augusta of Bavaria, who died two months after his marriage, in March 1835. In the following January Maria married Prince Ferdinand of Saxe-Coburg-Gotha, nephew of Leopold, the first king of the Belgians; and it was his nomination to the post of commander-in-chief that brought about the first appeal to arms. In September 1836 Fernando Soares da Caldeira headed a pronunciamento in Lisbon for the re-establishment of the constitution of 1822, which was completely successful, and resulted in the drawing up of a new constitution. The constitution of 1838, which was really that of 1822 slightly modified, managed to work till 1842, when one of the radical ministers, Antonio Bermudo de Costa Cabral, suddenly declared the charter of 1826 at Oporto. The duke of Terceira headed a successful pronunciamento in favour of the charter, and came into office with Costa Cabral as home secretary and virtual prime minister. Costa Cabral, who in 1845 was created count of Thomar, made himself very acceptable to the queen, and, interpreting the charter in the most royalist sense, even attempted to check the freedom of the press. It was now the turn of the radicals or Septembrists to have recourse to arms: after an attempt to place Saldanha in office, the opposition broke out into open insurrection under the viscount of Sá de Bandeira, the count of Bomfim, and the count das Antas. This new insurrection is known as the War of Maria da Fonte or "patuleia," and was not suppressed until the conclusion of the convention of Granada on 29th June 1847, when a general amnesty was declared, Saldanha being continued in power. Queen Maria da Gloria died on 15th November 1853, and her husband, the king-consort, Dom Ferdinand II., assumed the regency until his eldest son Dom Pedro V. came of age.

The era of peaceful parliamentary government which succeeded the stormy reign of Queen Maria II. has been one of prosperity for Portugal, and much of that peace and prosperity is due to the great literary and historical revival which is signalized by the names of João Baptista de Almeida Garrett and Antonio Feliciano de Castilho; of Alexandre Herculano de Carvalho e Araujo and Luis Augusto Rebello da Silva. Men were not wanting in the early part of the 19th century to advocate the formation of an Iberian republic or kingdom, comprising the whole of the Peninsula; but the revival of national pride in recalling the glorious past of Portuguese history, which has been the work alike of Herculano and Almeida Garrett in different lines, has breathed afresh the spirit of patriotism into a people who had been almost wearied out by continual pronunciamentos. The only political event of any importance during the reign of Dom Pedro V., who came of age Pedro V. and assumed the government in 1855, and who in 1857 married the princess Stephanie of Hohenzollern, was the affair of the "Charles et Georges." This French ship was engaged in what was undoubtedly the slave-trade, though slightly disguised, off the coast of Africa, when it was seized by the authorities of Mozambique, and, in accordance with the laws and treaties against the slave-trade, its captain, Roussel, was condemned to two years' imprisonment. The emperor Napoleon III., glad to have a chance of posing before the French people, and counting on his close alliance with England, instantly sent a large fleet to the Tagus under Admiral Lavaud, and demanded compensation, which, as England showed no signs of assistance, Portugal was compelled to pay. The whole country, especi-

ally the city of Lisbon, was ravaged by cholera and yellow fever during this reign, itself evidence of the extreme neglect of all sanitary precautions; and on 11th November 1861 the king, who refused to quit the pestilence-stricken capital, died of cholera, and was speedily followed to the grave by two of his brothers, Dom Ferdinand and Dom John.

Luis.

At the time of Dom Pedro's death his brother and heir, Dom Luis, was travelling on the Continent; and his father, Dom Ferdinand, again assumed the regency until his son's return, soon after which Luis married Maria Pia of Savoy, daughter of Victor Emmanuel, king of Italy. The new king followed his brother's policy and allowed his ministers to fight their battles in the chambers without interference from himself. During his reign the old combatants of the reign of Maria da Gloria died off one by one,—Palmella, Terceira, Thomar, Saldanha, and Sá de Bandeira. Their successors in political leadership, the duke of Loulé, Aguiar, the marquis of Avila, and Antonio Manuel Fontes Pereira de Mello, though not inferior in administrative ability, always avoided an appeal to arms, and therefore, if they do not contribute striking pages to the history of Portugal, certainly contributed more to the prosperity of the country. The last pronunciamiento, or rather attempt at a pronunciamiento, of the last survivor of Queen Maria's turbulent statesmen, the duke of Saldanha, in 1870, only proved how entirely the day of pronunciamientos had gone by. He conceived the notion that the duke of Loulé, as a freemason and an advanced progressist, was a favourite with the king, after the manner of the duke of Polignac and Charles X. of France; so, recalling a few such historical examples to the king's mind, he insisted on the duke's dismissal, and threatened an appeal to arms. The king, perceiving that Saldanha was in earnest, and knowing the great influence of the old man, consented to dismiss the duke of Loulé. After keeping Saldanha himself in office for four months, Luis sent him as ambassador to London notwithstanding his eighty years, where he could do no mischief, and where he died in 1876. The steady prosperity of Portugal has been largely due to the present form of government based on the charter of 1826, as modified in 1852, and is borne witness to by the reconstitution of the House of Peers in 1878 from an hereditary assembly to one of life peers. It is a notable fact that the two loans raised by the Portuguese Government in 1880 and in 1882 were quickly subscribed, and mainly within Portugal itself. Of recent years much attention has been drawn to the Portuguese settlements in Africa, since the opening up of the interior has made them of vast importance on both the east and the west coast. The king, ministers, and people of Portugal are fully aware of the new vista to their prosperity thus disclosed to them, and the Portuguese travellers Serpa Pinto, Roberto Ivens, and Brito Capello have taken an important share in the explorations which have opened up the interior of Africa and paved the way for its development. Public works, however, have not been neglected, and Fontes Pereira de Mello, the leader of the "regenerator" party, who has been prime minister three times—from 1871 to 1877, from 1878 to 1882, and from 1883—has steadily improved and extended the railway and telegraph systems, and carried out the more difficult labours of sanitary reform. Education also has not been neglected, and a good system of secondary and primary education has been established, mainly owing to the labours of the Portuguese poet, Antonio Feliciano de Castilho. The share taken by the leaders of the great literary and historical revival—which dates from the conclusion of the civil wars of 1846 and the publication of the first volume of Herculano's *History of Portugal* in 1848—in Portuguese political and social reform is a marked feature of the modern parlia-

mentary life of the country; and not only have the poets Almeida Garrett and Mendes Leal and the historian Rebello da Silva held office, but many of the most promising of the new generation of literary men, such as Latino Coelho and Pinheiro Chagas, have distinguished themselves in politics. Few countries so well realize the advantages of a constitutional and parliamentary form of government as Portugal; socialism possesses there a reforming, not a revolutionary force; unity of pride in their country inspired by great writers has made the modern Portuguese ambitious to revive the glories of the past, and united men of all shades of opinion in a common patriotism. The Camoens celebration of 1880 showed that the Brazilians were still proud of their mother-country, and that the Portuguese race all over the world was ready to develop new energy and perseverance, and to prove its true descent from the men who under Affonso Henriques overthrew the Moors, who under John I. and John IV. rejected the rule of the Spaniards, under Affonso de Albuquerque and João de Castro conquered the East, and who by the voyage of Vasco de Gama created a new era in the history of the world.

Bibliography.—The best continuous history of Portugal is still that of Heinrich Schaefer, in Heeren and Ukert's *Europäische Staats-Geschichte*, 1840-46, partly translated into Portuguese by J. L. Domingues de Mendonça (Lisbon, 1842-47), which quite eclipsed the very ordinary works of Diogo Lemos (20 vols., 1786-1820), Sousa Monteiro (10 vols., 1838), and J. F. Pereira (3 vols., 1846-48), and the two chief English and French histories up to that date,—J. Dunham's (along with that of Spain) in Lardner's *Cabinet Cyclopædia* (1838-43), and Bouchot's, in Duruy's *Histoire Universelle* (1846). After the publication of Schaefer's *History*, and not uninfluenced by it, Alexandre Herculano commenced his great work, the *História de Portugal* (4 vols., 1848-53), in which he overthrew old legends and treated history scientifically. Owing, however, to the persecution and libellous pamphlets of such men as Francisco Recreio, J. D. Fonseca Pereira, and A. C. Pereira, he closed his work at the year 1279; but from 1854 to 1857 he published his *Da Origem e Estabelecimento da Inquisição em Portugal*, which also caused a great outcry. Nevertheless his example was followed, and a series of extremely good histories has been issued during the last twenty years, notably L. A. Rebello da Silva's *História de Portugal pendente XVI. e XVII. Seculos* (5 vols., 1860-71), which covers the failure of Dom Sebastian and the revolution of 1640; J. M. Latino Coelho's *História de Portugal desde os fins do XVIII. Seculo até 1814* (1874); J. F. Fonseca Benevides's *Las Rainhas de Portugal* (1878); and the extremely interesting and illustrated *História de Portugal* in 37 parts by Antonio Ennes, B. Ribeiro, Edouard Vidal, G. Lobato, L. Cordeiro, and Pinheiro Chagas (1877-83). The new historical school, headed by the viscount of Santarem, has also spent much time upon the conquests of the Portuguese in India, and Herculano edited the *Roteiro de Vasco de Gama*; nor must the admirable editions of the old Portuguese navigators and travellers published by the Hakluyt Society be omitted, or the well-known *Life of Prince Henry of Portugal*, by R. H. Major (London, 1868), which has been translated into Portuguese by J. A. Ferreira Brandão (1876). The new school has paid attention to the publication of the early chronicles of Portugal, and since 1856 several volumes of *Portugallia Monumenta Historica* have been issued by the Lisbon Academy of Sciences under the direction of Herculano; but this work was not neglected by their predecessors, as appears in the *Collecção dos Livros inéditos de História Portuguesa*, edited by J. F. Corrêa da Serra for the academy (11 vols., 1790-1804), and the *Collecção dos principaes Autores da História Portuguesa*, published in the same manner (1806). *Faderna*, too, were not neglected during the present century; there exist two good collections: one, commenced by the viscount of Santarem as *Quadro elementar das Relações politicas e diplomaticas de Portugal*, and continued by Rebello da Silva for the academy as *Corpo diplomatico Portuguez*, extends from the early days of the monarchy till 1640 (36 vols., 1856-78); the other, which is practically a continuation of the first, is called a *Collecção dos Actos publicos celebrados entre a Coroa de Portugal e as mais Potencias desde 1640 até ao Presente*, commenced by J. Ferreira Borges de Castro, and continued by J. Judice Biker (8 vols., 1856-66). Two works on constitutional history here deserve mention, *Memorias para a História das Inquirições dos primeiros Reinados de Portugal*, published (1816) by the Lisbon College of Diplomats, and *Memorias para a História e Theoria das Cortes*, by the viscount of Santarem (Lisbon, 1828). Before noticing books treating exclusively of the history of the present century, a few special works and articles ought to be enumerated, such as the chevalier de Jant's *Relations de la France avec le Portugal*

au temps de Macarín, by Jules Tessier (Paris, 1877); Vertot's *Revolutions de Portugal* (Paris, 1678); Miguel d'Antas, *Les fautes de Sebastien* (Paris, 1866); R. Carte's *History of the Revolutions of Portugal from the Foundation of that Kingdom to the year 1677, with Letters of Sir R. Southwell during his Embassy there to the Duke of Ormond* (London, 1740), which are the best books on their respective subjects, and two articles in vol. ii. of the *Annaes das Sciencias Moraes e Politicas*, "D. João II. e a Nobreza," by L. A. Rebello da Silva, and "Apostamentos para a Historia da Conquista de Portugal por Philippe II.," by A. P. Lopes de Mendonça. The literature of the history of the last hundred years requires careful selection; the best work is, however, the *Historia da Guerra civil e do Estabelecimento do Governo parlamentar em Portugal*, by Simião José da Luz Soriano (8 vols., 1866-82); for the Peninsular War see, besides Napier's history, the *Historia geral da Invasão dos*

Franceses em Portugal, by Accursio das Neves (Lisbon, 1810-11), and *Excerptos historicos relativos a Guerra denominada da Peninsula, e as anteriores de 1801, de Roussillon e Cataluña*, by Claudio de Chaby (1863). The period of the war of Dom Miguel is best seen in the *Memorias para a Historia do tempo que durou a Usurpação de D. Miguel*, by J. L. Freire de Carvalho (Lisbon, 1841-48); the *Historia da Liberdade em Portugal*, by J. G. Barros Cunha (Lisbon, 1869); *The Civil War in Portugal, and the Siege of Oporto by a British Officer of Hussars* [Colonel Badcock] (1835); and *The Wars of Succession of Spain and Portugal*, by William Bollaert (vol. i., 1870). For the ensuing period consult the *Despachos e Correspondencia do Duque de Palmella* (3 vols., 1851-54); the *Correspondencia official de Conde de Carneira com o Duque de Palmella* (1874); and the *Memoirs of the Duke of Saldanha*, by the count of Carnota (2 vols., 1880). (H. M. S.)

PART III.—LITERATURE.

Portugal has a distinct literature as well as a distinct history, and one which is intimately bound up with the growth of the nation. The biographies, histories, and travels of the 16th century are unrivalled of their age in brilliancy and vigour, while the poetry of a land where all men are singers is not only admirable in itself but illustrates a continuous and undecided struggle between native and foreign schools. The period of the growth of national independence and of the victories over the Moors was that of the brilliant poetry of the Portuguese troubadours, which became at last truly characteristic; but the brilliancy speedily died away with peace and national unity, to be revived in the heroic period of Vasco de Gama and Albuquerque. For in the 16th century, after the classical school of Sá de Miranda had given a polish to the language, the national epics of Camoens and his followers were produced, which might have yielded more lasting results had not the Spanish dominion paralysed all national life. In more modern times the reaction against mere imitations of foreign literature has resulted in the formation of a new native school by which much good work both in poetry and in historical research has already been accomplished.

Troubadours.

12th to 14th Century.—The Portuguese, Gallegan, and Bable dialects, subdivisions of that form of the *Lingua Romana Rustica* spoken in Galicia and the western provinces of the Peninsula, will be more conveniently treated under SPAIN (LITERATURE). See also ROMANCE LANGUAGES. The remains of the early poets of Portugal are necessarily scanty, but they are sufficient to show that the courtly troubadours of the west were certainly not inferior to the more noted singers of Provence. In some respects they were even superior, since, not being tied to the forms of a merely literary language such as the Provençal, they were able to borrow both form and matter from a vigorous national poetry which can be traced through the different races which successively occupied Portugal. The "alalala," which afterwards developed into the "aravia," the earliest form of the epic, is probably a legacy from the original Turanian inhabitants; the "guayado," a short lyric with the refrain "ay" or "guai," was derived from their Celtic successors; the "cantos de ledino," are evidences of the Roman conquest, which in turn gave place to the "chacones" or dance-songs of the Visigoths; while during the Arab dominion the sensuous "serranilhas" and "cantos de amigo" found a place in the family "cancioneiros," which were then compiled in imitation of the divans or tribal songs of the ruling race. This national poetry, however, was for long affected in its literary form by foreign influences. From the beginning of the reign of Afonso Henriques (1112) to the death of Dom Sancho II. (1248) the court was under direct Provençal influence; and it is not improbable that in 1146 the celebrated troubadour Marcabrun was himself attached to the suite of Donna Matilda on her marriage with Afonso Henriques, since he was certainly a visitor at the court in 1147. The poets Egas Moniz Coelho and Gonçalo Herminguez are commonly, though erroneously, referred to the time of Afonso Henriques, who was himself a poet; but the name (and poem) of only one undoubtedly Portuguese troubadour of this period has survived, João Soares de Panha (1145-1204). The history of Galician literature properly belongs to that of Spain, but it is important to remember that Portugal is perhaps even more than Castile the heir of its early efforts. Amongst the Galician poets who frequented the court of Sancho I. (1185-1211) and formed a strong opposition to the Italo-Provençal school were Afonso Gomez, Fernam Goncalves de Senabria, and João Soares de Paiva. The most famous of their Provençal rivals, who doubtless were the more readily welcomed owing to the king's marriage with a daughter of Raymond Berenger IV., count of Provence and king of Aragon, were Peire Vidal, Peire Valeira, and Gavaudan o Velho, who in a "sirvente" written about 1210 incited the Christians to a crusade against the Moors. Afonso III. (1248-1279) returned from his residence at the court of St Louis of France imbued with northern rather than with southern sentiments, and consequently during his reign French influences prevailed. The nobles who had accompanied him were "trouvères" rather than "troubadours" and to one of them, Afonso Lopes de Bayam, belongs the honour of writing the first Portuguese gesta, a *Gesta de Maldizer*. Other celebrated poets of this Franco-Provençal school were the "privados," or court poets, João de Aboim, the author of several sirventes and tensons, but, like De Bayam, the writer also of cantos de amigo and cantos de ledino, Fernão Garcia Esgaravunha, and João Garcia o Pinto, his brother. The privados were in their turn satirized by Martim Moxa and Lourenço and Diogo Pezelho, who belonged to the less privileged class of "segreiros," a term applied to those singers who wandered from court to court. The king's songs have been lost, or at least cannot be identified, but he is reputed to have been no mean poet, and a sirvente against Alphonso X. of Castile, which appears from internal evidence to have been written by him, is still extant. To this period also belonged the privados Fernão Fernandes Cogominho, the writer of cantos de amigo and serranilhas, and Estevam Coelho, of whose works two lovely serranilhas remain of the purest Galician form and feeling. The works of these poets show that, notwithstanding foreign influence, the national forms had already obtained some degree of favour at court. Similarity in the literary language led to considerable intercourse between Portugal and Castile, and the Galicians Pero da Ponte and Afonso Eanes de Coton were entertained by Afonso III., while the Portuguese poets Pero Gomes Barroso, Payo Gomes Charrinho, and Gonçalo Eanes do Vinhal enjoyed the patronage of Alphonso the Wise. On the accession of Diniz (1279-1325) the court literature showed the decided southern and Provençal tendencies of this king, who from the number, variety, and beauty of his songs was himself the greatest poet of his time. Educated by Aymeric d'Ebrard of Cahors, afterwards bishop of Coimbra, he at first affected the mannerisms of the decaying school of Provence. With the courts of Love which he introduced came the Limousin decasyllabic in place of the national octosyllabic metre, and the ancient forms were lost in the intricacies of the ritournelle. This king's songs are marked by an exaggerated subjectivism, but among them quaint and graceful "pastorellas" are found, full of poetic life and truth, which show that the king was not blind to the beauty of his people's lyrics. Admiration led to imitation, and the close of his reign is marked by a distinct literary revival of the national poetry, which at his hands received a polish it had somewhat lacked before. The effects of Diniz's influence pervade the whole of Portuguese poetry, for not only was he in his pastorellas the forerunner of the great pastoral school, but by sanctifying to literary use the national storehouse of song he perpetuated among his people, even to the present day, lyric forms of great beauty. Dom Diniz completely overshadows the poets who were his courtiers and contemporaries, but amongst them the most notable were Estevam da Guarda, Ayra Peres Veyturon, Ruy Gonçaves, João Eanes, and João de Guilharda, though the last-named was rather a musician than a poet. Dom Afonso Sanches, a natural son of Dom Diniz, wrote partly in the Limousin and partly in the Galician style, and another son, Dom Pedro, Conde de Barcellos, who compiled a "livro das cantigas" and a "nobiliario" or peerage, was the author of several poems, but in an affected strain, which marked the approaching decay of lyric poetry. With the reign of Afonso IV. (1325-1357) began the reaction of the Castilian language against the Portuguese, but the quarrels of Ferdinand (1367-1383) with Henry II. of Castile were the fortunate cause of the formation of a second national school. For amongst its founders were the Galician poets who took refuge at the court of Portugal, and who were followers of Macias and Padron, including Vasco Pires de Camões, ancestor of the great Luis, while to this period must be properly assigned the poems of Egas Moniz Coelho and Gonçalo Herminguez.

Provençal influence.

Epic poetry was in Portugal as in Provence a later literary development than lyric. The popular aravias must have been poetry, numerous, to judge from the remains which are still found in the Azores and in the provinces of Beira and Algarves; and to the 18th century may be referred the *Loenda de Santa Iria* and the *Canção do Figueiral*. In its literary form the Breton "lai" was

known to Dom Pedro, brother of Affonso II. (1211-1223), and a few poems in this style with music attached were written by him. The *Roman de Brut* is also quoted by Diniz, but it was through the marriage of John I. with Philippa of Lancaster (1387) that a knowledge of the Arthurian cycle spread through the Peninsula and led to the popularity of the *Prophecies of Merlin* and kindred works down to the 16th century. The patriotic pride of the people, which had before found vent in the aravias or tales of contests with the Arabs, sought a new literary expression for the rising national greatness, and the parent of Camões's great epic is the poem in which Affonso Giraldes celebrates the victory won by the united armies of Portugal and Castile over the Moors at the battle of the Salado (1340). Only a small portion is extant, but it shows considerable vigour and foreshadows the development which national pride was afterwards to take in the *Lusiads*.

The revolt against the subjectivism of lyric poetry which appeared in the narrative spirit of the epic showed itself now in another form, and to Affonso IV. belongs the credit of fully appreciating the new tendencies. Acting under his instructions, Vasco de Lobeira (d. 1403) became the author of the first Portuguese novel by turning into prose the romance of *Amadis of Gaul*, which led the way for a host of imitations bearing a similar title. The historical records of this period are comprised chiefly in the *Chronica da Conquista do Algarve*, the *Livro velho das Linhagens*, and the *Nobiliario do Collegio dos Nobres*. The theological tendencies of the people are aptly illustrated by works which, although in Latin, deserve mention. They are the *Concordantias Morales* and *Interpretatio Mystica* by St Anthony of Lisbon (1195-1231), and the writings of Cardinal Alvaro Paes (d. 1358). The most learned scholar, however, of this period was Pedro Hispano, who became Pope John XXI. (d. 1277), and whose universal learning recalled the days of the great schoolmen.

Fifteenth century. 15th Century.—During this century lyric poetry was under the increasing influence of the Spanish school and of its leader Juan de Mena, whose praises were sung in some couplets by the infante Dom Pedro, son of John I. The chief imitators of this style were Luis de Azevedo, Ayres Telles (d. 1515), and Diogo Brandão (d. 1530). The Arthurian romances of *Dom Eurives* and *Bramus-Flor* may be referred to this century; and the poems on the death of the infante Dom Pedro by Luis de Azevedo, and on the death of John II. by Diogo Brandão exhibit the literary form of the epic. The constable, son of Dom Pedro, felt the influence of the Italian Renaissance, and consequently became the founder of the Dantesque or allegorical school. His *Satyra da felice e infelice Vida* is an allegorical piece of some merit, but a better specimen of this style is the *Visão* by Duarte de Brito, a compound of the *Roman de la Rose* and the *Divina Commedia*. The *Fingimento de Amore* by Fernão Brandão also possesses many beauties.

The principal prose works of the time are the *Book of the Chase* written for John I. (1383-1433), the vivid and interesting *Chronicles* of Fernão Lopes (1380-1459), the Froissart of Portugal, and the *Chronicles* of Gomes Eanes de Azurara (d. 1473), Ruy de Pina (1440-1520), and Duarte Galvão (1445-1517). King Edward himself (1433-1438) was the author of *The Faithful Councillor* and *Instructions in Horsemanship*, while a *Treatise on Tactics* with several other works showed the powers of Affonso V. (1438-1481) as a general mathematician and natural philosopher, the cultivation of which may have been in part due to the lessons learned from the *Cyropædia* translated for him by Vasco de Lucena.

National and classical schools. 16th and 17th Centuries.—The golden age of Portuguese literature had now arrived, and to Bernardim Ribeiro (c. 1500) is due the honour of founding its characteristic school of romantic pastoral poetry. The rivers and mountains of his native land are the natural framework of a poet's fancy, and the revival of classical learning showed him in the *Elogues* of Virgil a model which he was not slow to imitate. His *Elogues*, written in "redondilhas" (octosyllabic nine or ten-lined stanzas), are accordingly the earliest in modern Europe, and, while replete with the charms and conceits of versification of the troubadours, show a truly poetic love of nature. He was also the writer of the first "sextinas" in redondilhas, and of many beautiful cantigas and elegies. To the same school, which was now the representative of all national feeling, belong Christovão Falcão, whose smaller poems are quite equal to those of Ribeiro, Garcia de Resende (1470-1554), compiler of the *Cancioneiro Geral*, a magnificent collection of poems by almost three hundred writers, beginning with Affonso Henriques, Gil Vicente (1470-1536), Jorge Ferreira de Vasconcellos (d. 1585), and Fernão Rodrigues Lobo Soropita (c. 1600). The last-named is chiefly known from three comic satires on the classical school and his *Introduction* to the poems of Camoens, which formed the basis of Faria e Sousa's *Commentary*. Except for the fact that a master-mind belongs to no school, Camoens himself might be claimed by these writers as a fellow-worker, for he was systematically either ignored or abused by the opposing school of classicists. His works are treated of at length elsewhere (see CAMOENS), but it is not out of place to remark here that his beauties are those of the national school and his defects the result of an imitation of the classicisms affected by his

opponents. These were the followers of the school founded by Francisco de Sá de Miranda (1495-1558) on his return from Italy, where he acquired a love not only for the Renaissance, whose influence had been already felt by Ribeiro, but for the forms in which the new culture found expression. Much praise is due to him for the polish he gave to his country's literature, but by his classical affectations and the favour he showed to the Spanish language, in which his best works were written, he sowed the seeds of that decay which afterwards overtook Portuguese poetry. The eclogues, epistles, odes, elegies, and sonnets of this school are often perfect in form and contain much real poetry, but the classicisms which at first are graceful in their novelty weary in the end by their unreality, and in the hands of inferior artists degenerate into mere stage properties, used to conceal the want of genius. The shepherds and shepherdesses are no longer the idealized peasants of the troubadours but courtiers in masquerade, and the sense of this lowering of the ideal is sufficient to destroy the pleasure which would otherwise be derived from the polished language and poetic imagination. The imitators of Miranda were very numerous; the chief among them were Antonio de Ferreira (1523-1569), who was Horatian rather than Virgilian in feeling, and consequently produced but inferior eclogues, while his didactic epistles were the earliest Portuguese examples of that style, Diogo Bernardes (d. 1599), whose sacred songs are particularly good, Pedro de Andrade de Caminha (d. 1589), Fernão Alvares do Oriente (b. 1540), Don Manuel de Portugal (d. 1606), and Estevão Rodrigues de Castro (1559-1637). Among the lyric poets of the 17th century the chief of those who by their satirical and comic verses showed an inclination to the national rather than the classical school were Thomas de Noronha (d. 1651) and Jacinto Freire de Andrade (1597-1657), author of the *Fabulas de Narciso* and of various songs and sonnets published in the *Fenix Renascida* (1716-1728). Antonio Barbosa Bacellar (1610-1663) was the first writer of "saundades," and was followed in the same style by Simão Torrezão Coelho (d. 1642). Sonnets were of course written by every man of culture, but they rarely rose above the standard of mediocrity. Those of Manuel de Faria e Sousa (1590-1649), Duarte Ribeiro de Macedo (1618-1680), and André Nunes da Sylva (1630-1705) may, however, be reckoned among the best. The sacred poems of the last-named are also very good, but are surpassed by the *Jardim do Ceo* by Eloi de Sá Sotomaior, and by the poems of Sister Violante do Céu (1601-1693). The didactic epistles of Antonio Alvares da Cunha (1626-1690) are fair specimens of this class of poem.

The truly heroic life of Portugal during this period naturally demanded to be sung in a fitting strain, and the 16th and 17th centuries were consequently the era of epic poems. The earliest of 17th-century was the *Creação do Homem* by André Falcão de Resende (d. 1598), which from its similarity in style has been often attributed to Camoens (1524-1579), whose *Lusiads* appeared in 1572. Though the sole masterpiece of the country and the age, this last not unworthily eclipses other epics in which the brilliant passages are more or less numerous. Such are the *Primeiro Cerceo de Diu* by Francisco de Andrade (1540-1614), the *Naufragio de Sepulveda* and the *Segundo Cerceo de Diu* by Jeronymo Côrte-Real (1540-1593), both rather above the average, the *Elegiada* (1588) by Luis Pereira Brandão, the *Affonso Africano* (1611) by Vasco Mousinho de Quebedo, who shares with Côrte-Real the honour of ranking next after Camoens, the *Ulysséa* by Gabriel Pereira de Castro (1571-1632), the *Viriato Tragico* by Braz Garcia Mascarenhas (1596-1656), the *Malaca Conquistada* by Francisco de Sá de Menezes (d. 1664), the *Ulyssipo* by Antonio de Souza de Macedo (1606-1682), and the *Destruição de Hespanha* (1671) by André da Silva Mascarenhas.

The drama in Portugal was stifled in its birth. The miracle-Drama plays of the people attained a high degree of excellence in the "autos" or sacred Christmas plays of Gil Vicente (1470-1536), but this writer was born half a century too soon for his work. His comedies, of which the best is *Inez Pereira*, are full of the rough wit which is found in the early Latin writers, but show a want of polish and dramatic conception which is fatal to their claims to high rank as works of art. The comedies of his contemporaries, Antonio Prestes, Jorge Pinto, and Jeronymo Ribeiro Soares, all show considerable talent, and the *Eufrosina* of Jorge Ferreira de Vasconcellos (d. 1585) most nearly approaches to a modern standard of excellence. Francisco Manuel de Mello (1611-1666) was the author in Portuguese of the *Auto do Fidalgo Aprendiz* as well as of several poems, but most of his works are in the Spanish language. Among the classicists Miranda was the author of the comedies *Os Estrangeiros* and *Os Vilhalpandos*, but his plays are inferior to those of Ferreira, whose dramatic works are in some respects superior to his poems. The chief of them, which was produced only a few years later than the *Sophonisba* of Trissino, is the tragedy *Inez de Castro*, but, though his subject was so fine, his treatment of it was not altogether satisfactory. There are also several plays by Camoens; but the influence of the Spanish language was by this time irresistible, and the result was that all serious dramas were written in Castilian, while Portuguese was reserved only for the lighter and more popular pieces, the best of which were collected

by Coelho Rebello in *A Musa entretenida de varios Entremeses* (Coimbra, 1658).

In prose the imitations of *Amadis of Gaul* were followed by the school of the *Palmeirims*, which originated in the romance of chivalry *Palmeirim d'Inglaterra*. The first and second parts of this work were probably by the Spaniard Hurtado, and were only translated by Francisco de Morães (d. 1572); the third and fourth parts were written by Diogo Fernandes (c. 1580), and the fifth and sixth by Balthasar Gonçalves Lobato (c. 1600). But Morães, though thus missing the honour of being an originator, was probably the author of the scarcely less celebrated *Palmeirim de Oliva*. The *Livro de Cavallaria* by Fernão Lopes da Castanheda (d. 1559), the *Chronica do Emperador Clarimundo* by João de Barros (1496-1570), several works by Francisco Rodrigues Lobo (c. 1600), and the *Chronica do famoso Príncipe D. Clarisol de Bretanha* (1602) by B. G. Lobato are of a similar character. The pastoral novel originated in the *Menina e Moça* by Bernardim Ribeiro, a composition in prose and verse which gave rise through its imitation in Spanish by Jorge de Monte Mór (d. 1561) to the school of the *Dianas*. This style was in its turn imitated in Portuguese by Fernão Alvares do Oriente (b. 1540) in the *Lusitania Transformatada*, and among other examples may be noted the *Ribeiras do Mondego* (1623) by Elói de Sá Sotomaior, and the *Primavera, O Pastor Peregrino*, and *O Desenganado* (1601) by F. R. Lobo. The last-named was also the author of the more meritorious *Côrte na Aldéa*, a sort of *Friends in Council*, which was afterwards imitated in the *Serão político* by Felix da Costanheira Turacem, the *nom-de-plume* of Lucas de St Catherine (1660-1740). To the pastoral novel succeeded the allegories, of which *Grand Cyprus*, *Clelia*, and *Astrea* are the best examples. The Inquisition, however, laid its ban upon them when they showed mystical tendencies, as in the *Pé de Rosa Fragrante*, *Cerva Branca*, &c.; but an adaptation of the *Pilgrim's Progress* was published by the inquisitor Alexandre de Gusmão (1629-1724), with a view to proving the efficacy of infant baptism, which was certainly not the intention of Bunyan. The Decameron tales took the form in this period of the *Contos e Historias de Proveito e Exemplo* (1589) by Gonçalo Fernandes Trancoso, the *Infortúnios tragicos da constante Florinda* (1625) by Gaspar Pires de Rebello, and the *Alívio de Tristes* (1672), *Retiro de Cuidados* (1681), and *Roda da Fortuna* (1692) by Mattheus Ribeiro. The pride in the national greatness which found poetical expression in the epic also caused the rise of a great school of historians. The older royal chroniclers were followed by Garcia de Resende (1470-1554), Christovão Rodrigues Azenheiro (b. 1474), and Damião de Goes (1501-1573). Their chronicles are graphic and interesting, though inferior in style to the works of their successor, who was the most brilliant early historian Portugal can boast. This was João de Barros (1496-1570), author of the *Conquest of the Indies*, which was afterwards continued in the *Asia Portuguesa* by Manuel de Faria e Sousa (1590-1649), a learned and facile writer, from whose pen are also the *Europa*, *Africa*, and *America Portuguesa*, a *Commentary* on Camoens, and numerous other works. The style of Barros is both elegant and energetic, and the criticism and accuracy which he displays make him still an authority of the first rank. The next greatest historian after Barros was the monk Bernardo de Brito (1569-1617), author of *Monarchia Lusitana*, of which there is a continuation by Antonio Brandão (1584-1637), and of the *Chronicles of the Cistercians* and of *D. Sebastião*. The elegant Latinist and best antiquary of the 16th century, André de Resende (1498-1573), whose talents were recognized by Erasmus, produced the *De antiquitatibus Lusitanis* and the *Life of the Infante D. Duarte*; and the *History of the Discovery and Conquest of India* by Fernão Lopes de Castanheda (d. 1559), the *Chronicles of D. Sebastião* by Bernardo da Cruz (1530-1586) and by Manuel de Menezes (d. 1628), the *Life of D. João de Castro* by Jacinto Freire de Andrade (1597-1657), which is still the type of perfect biography, the *Chronicles of Scanderbeg* and *D. John III.* by Francisco de Andrade (1540-1614), the *Commentaries of Afonso d'Albuquerque* (1500-1580), compiled by his son, and the works of Diogo do Couto (1542-1616) and Duarte Nunes do Leão (d. 1608) supply a mass of interesting historical material. To Antonio Barbosa Bacellar (1610-1663) is due an account of the *Siege and Capture of Recife*; and the *True Account of Prester John* (1540) by Francisco Alvares, the *Travels in China, Tartary, &c.*, of Fernão Mendes Pinto (1509-1580), and in Persia (1610) of Pedro Teixeira, the account of the *Mission of Aleixo de Menezes to the Christians of S. Thomas* by Antonio de Gouvea (d. 1628), and the *History of Tangier* by Fernando de Menezes (1614-1699) are all classical works and full of interest. Among religious works may be mentioned those of Diogo de Paiva e Andrade (1528-1575) and of Diogo de Gouvea (d. 1576), the *Commentaries of the Hebrew scholar Jeronimo de Azambuja* (1520-1565), the *Life of S. Francis Xavier* by João de Lucena (1550-1600), the *Commentaries on the Minor Prophets* by Bernardo de Brito (1569-1617), the *Lives of S. Dominic* and other saints by Luis de Sousa (1555-1632), the *Agilogio Lusitano* by Jorge Cardoso (1616-1669), the *Sermons* of the great preachers Gaspar Pires de Rebello (c. 1625) and Antonio Vieira (1608-1697), the *Clavis Prophetarum* of the last-named, and the works of Bartholomeu do Quental (1626-1698),

founder of the Portuguese branch of the Oratorians. The scientific writers of the period are not numerous, being represented chiefly by writers. the cosmographer Pedro Nunes (1492-1577), one of the greatest mathematicians of his time, Estevão Rodrigues de Castro (1559-1637), author of a *Commentary on Hippocrates* and various other medical works, and the astronomer Manuel Bocarro Francez (1588-1662).

18th Century.—During the preceding century there had been Eight-founded in imitation of the Italians numerous "arcádias" or literary eenth clubs under fantastic titles, such as "Ambientes," "Solitarios," &c. century. Their influence was insignificant, and their existence would call for no remark were they not the forerunners of the academies, which during the 18th century saved Portuguese literature from total extinction. In the year 1714 was founded the Lisbon Royal Academy of Sciences, which was succeeded by the Portuguese Academy, whose first president was the learned historian Francisco Xavier de Menezes, count of Ericeira (1673-1743), author of the epic *Henriqueida*. His numerous translations of the works of Boileau and other French writers had considerable influence on Portuguese literature, and the founding in 1757 of the "Arcadia de Lisboa," in which the great minister the marquis of Pombal was supreme, led to a wider spread of the teachings of the Encyclopaedists. The arcadia ceased to exist in 1774, but was followed in 1779 by the Royal Academy of Sciences, founded by the duke of Lafões, and by the "Nova Arcadia," which flourished between 1790 and 1806. As regards poetry these academies were little more than manufactories of verse, the only lyric poets of the early part of the century being Thomas Pinto Brandão (1664-1748) and Antonio de Lima Barros Pereira (b. 1687); but their members, though wanting in poetical originality, showed considerable industry in historical research. The *Bibliotheca Lusitana* by Diogo Barbosa Machado (1682-1772) is a complete biographical dictionary of the Peninsula, and the *Life of the Infante D. Henrique* by Francisco José Freire (1719-1773) and the *General History of Portugal* by Damião Antonio de Lemos (1715-1789) are standard works, while the *Memorias de Litteratura* of the Royal Academy of Sciences contains much information about the literature of the 16th and 17th centuries. But the real founder of scientific history in Portugal, as opposed to mere collections of legends and traditions, was João Pedro Ribeiro (1759-1839), whose *Researches in Portuguese Chronology* show an historical scepticism far in advance of his age. To the same group of workers for the academy in the historical department belong Francisco de St Luis, cardinal-archbishop of Lisbon (1766-1845), Francisco Manuel Trigo (1777-1838), and José Francisco Corrêa da Serra (1750-1823), who edited the *Early Portuguese Chronicles*. In the latter half of this century a revival in poetry also took place, and the works of Antonio Diniz da Cruz e Silva (1731-1800), author of *Hyssope*, acquired for him the title of the Portuguese Boileau. With him were associated Pedro Antonio Corrêa Garção (1724-1772), author of the comedy *Assemblea* and the *Cantata de Dido*, Domingos dos Reis Quita (1728-1770), the best pastoral poet of the period, and the Brazilian Claudio Manuel da Costa (1729-1789). But to Francisco Manuel do Nascimento (1734-1819), who wrote under the *nom-de-plume* of Filinto Elysio, must be assigned the honour of being the reviver of letters in Portugal, not only by his elegant lyric poems but more especially by his miscellaneous writings and by his opposition to foreign imitations. His school of "Filintists" found rivals in the "Elmanists" led by Manuel Maria de Barbosa du Bocage (1766-1806), who, though less original than Nascimento, had perhaps greater influence. His poetical works are numerous, and he was, besides, the author of three tragedies, *Virtatus*, *Afonso Henriques*, and *Vasco de Gama*, which had some success. The poems of Antonio Ribeiro dos Santos (1745-1818), the satires of Nicolau Tolentino de Almeida (1741-1811), and the sonnets of Paulino Antonio Cabral de Vasconcellos (b. 1720) are all reckoned among the good work of the 18th century. But the best as well as the last work of this school is the epic *Oriente* (1814) by José Agostinho de Macedo (1761-1831), whose contemporary, José Anastasio da Cunha, was condemned by the Inquisition for the heresy contained in his *Oração Universal*. The tragedies *Osmia*, by Catharina de Sousa, countess of Vimieiro (1749-1824), and *Nova Castro*, by João Baptista Gomes (d. 1803), call for especial notice, as do the vaudevilles *Don Quixote* and *Esopaida* by Antonio José da Silva (1705-1739), while the national taste further showed itself in the favourable reception given to the comedies of his successor, Alexandre Antonio de Lima (b. 1699).

19th Century.—The political troubles of 1820 led to the expatriation of João Baptista de Almeida Garrett (Jonio Duriense) (1799-1854) and Alexandre Herculano (1810-1879), and the retreat to a monastery of Antonio Feliciano de Castilho (Memnide Egnense) (1800-1875). The first two were followers of Nascimento, the last of Bocage; but, while the enforced studies of Castilho only increased his classicist proclivities, the exile of Garrett and Herculano brought them into contact with romanticism. The effects are seen in Garrett's *D. Branca*, *João Mínimo*, and *Flores sem Fructo*, and later on in his most famous work, the *Folhas Caídas*. R. A. de Bulhão Pato, F. Gomes de Amorim, and E. Vidal have also written in the same style, but their poems have a less truthful ring than

Religious works.

those of Garrett, who is also the author of both the earliest and the best examples of the modern Portuguese drama, *Gil Vicente*, *Alfageme*, and *Luis de Sousa*. The principal works of Castilho are *A Primavera*, *Amor e Melancolia*, and *Excavações Poéticas*; and the writers who may chiefly be claimed as his followers are Sarmiento, J. M. de Costa e Silva the dramatist, Cabral de Mello, and Fernandes Leitão. The publication in 1848 of *O Trovador*, a collection of modern lyrics, marks the foundation of the school of Coimbra. Its leader, João de Lemos, the lyric poet, found fellow-workers in José Freire de Serpa, the impressionable author of *Solões*, and José da Silva Mendes Leal, author of the dramas *A Alva Estrela*, *A Madre Silva*, and *Os Homens de Marmore*, and various lyric poems. The most popular modern poet Luis Augusto Palmeirim, the dramatist A. Pereira da Cunha, Antonio de Serpa, and João de Andrade Corvo, author of the novel *Um Anno da Cbrte*, all belong to this school, the prevailing characteristic of which at its foundation was a profound admiration for Chateaubriand and his royalist and religious opinions. The second phase of this school dates from the *Novo Trovador*, in which the influence of Aimé Martin and Krause on its originator Soares de Passos is plainly visible. The poems of Passos are tinged with a melancholy which presaged his early death, and he philosophizes in the *Fimamento*, the *Escravo*, and the *Morte de Socrates* somewhat in the same strain as the English Lake poets. The third phase of the school of Coimbra is represented by the *Flores do Campo* and *Folhas Soltas* of João de Deus, the poet of love and revolution. Of the same school the *Visão dos Tempos* by Theophilo Braga is an attempt at a new revelation, and the *Odes Modernas* by Anthero do Quental are socialistic, but both writers show more than ordinary power. Other modern poets are Alberto Telles, Sousa Viterbo, Candido de Figueiredo, Gomes Leal, Thomas Ribeiro, A. J. Viale, and Guilherme de Azevedo. The plays of C. C. Branco and Ernesto Biester are above the average, and King Luis has worthily followed the traditions of his race in his translations of the plays of Shakespeare. The historical novels of Herculano are much admired by his countrymen, as well as those of L. A. Rebello da Silva; and the works of J. G. Gomes Coelho (Julio Diniz), A. de Oliveira Marreca, Mendes Leal, Bernardim Ribeiro, Arnal do Gama, Teixeira de Vasconcellos, and Camillo Castello Branco, with his accuracy of description, have some reputation; but the best modern novel, judged by an English standard, is *O Crime do Padre Amaro* by Eça de Queiroz. As the growth of Portuguese independence was coeval with the work of the troubadours, and the discoveries and conquests of the heroic age gave birth to the epic of Camoens, so, in like manner, the political revival of the 19th century has given rise to a school of great historians, the chief of whom was Alexandre Herculano. The exile of Herculano had brought him into contact with both English and French romanticism, as appears in his early poems and his historical novels, in which the influence of Lamartine and Scott is plainly visible, but in later life he was attracted to the new German school of historians founded by Ranke, and perceived that his true vocation was scientific history. His chief work has been the disentangle-

ment of the early history of Portugal from the mass of legends which had clustered round it, and his *History of Portugal* and *The Origin of the Inquisition in Portugal* are lasting monuments of industry and criticism. But Herculano perceived that, before a true knowledge could be gained of Portuguese history, a critical study must be made of early documents, so, using his official position, he commenced the publication for the academy of a magnificent edition of the *Origines* of Portuguese history. The viscount of Santarem began a similar work in his collections of *Federa*, though his fame will rest rather on his researches into the history of the great maritime discoveries of the 15th and 16th centuries. L. A. Rebello da Silva continued the work of Santarem in the publication of the *Corpo Diplomatico*, and his *History of Portugal in the 17th and 18th Centuries* is only inferior to the great work of Herculano. These historians inspired many others, among whom may be mentioned Fonseca Benevides, F. F. de la Figueira, Claudio de Chaby, and Simão José da Luz Soriano. The strength of this school is no doubt partly due to the extreme vigour of the reactionaries who were first called into existence by Herculano's attacks on superstitious legends. Their work is brilliant if not convincing, and it would not therefore be right to pass over without mention such names as F. Recreio, Pinheiro Chagas, and Affonso Ennes. In general literature the name of Francisco Alexandre Lobo (1763-1844) stands out prominently as the foremost man of the century, and the Portuguese equal of De Maistre, whilst Thomas de Carvalho, Rodrigo da Fonseca, Cesar Machado, Lopes de Mendonça, F. Adolpho Coelho, Theophilo Braga, Innocencio Francisco da Silva, and F. D. Vieira have all won a position as critics and essayists. Political liberty has gone hand in hand with the freedom of the press, and here again Herculano appears as the founder of the *Panorama*, in which he had the assistance of most of the writers above-mentioned. Besides these the most influential journalists are Teixeira de Vasconcellos, Rodrigues de Sampaio, and J. M. Latino Coelho. While the press remains free and can boast of such writers Portuguese literature will certainly increase in strength and vigour, and maintain the feeling of national pride and independence which appears so strongly in the works of Garrett and Herculano, and will always prevent a union with Spain.

Bibliography.—For the general history of Portuguese literature, Bouterwek, *Hist. of Spain and Port. Literature* (London, 1828); Sismondi, *Hist. of the Literature of the South of Europe* (London, 1828); and J. F. Denis, *Résumé de l'hist. litt. de Portugal* (Paris, 1826) may be consulted; also the "Notice on Literature" by Theo. Braga, in vol. i. of Vieira's *Grande Dicionario* (Oporto, 1871), and the same writer's *Introductions to the Antologia Portuguesa* (Oporto, 1876) and the *Parnaso Portuguez Moderno* (Lisbon, 1877). For the troubadour period, see the *Introductions to Trovas e Cantares*, ed. Varnhagen (Madrid, 1849), and the *Cancioneiro Portuguez*, ed. Braga (Lisbon, 1878). The *Memorias* of the academy and the *Introduction to the Parnaso Lusitano* (Paris, 1826) may be consulted for the classical period; and the *Memorias de Litt. contemporanea* by A. P. Lopes de Mendonça (Lisbon, 1855) and *La Littérature Portugaise* by J. M. Pereira da Silva (Rio, 1866) give a fair account of contemporary literature. The best biographical dictionaries are the *Bibliotheca Lusitana* by Machado (Lisbon, 1741) and the *Diccionario Bibliographico Portuguez* by Innocencio F. da Silva (Lisbon, 1858). (H. B. B.)

'PORUS, the name of the Indian king who withstood Alexander the Great on the banks of the Hydaspes (Jhelum). He was afterwards confirmed in his kingdom by the conqueror, and still held the position of a Macedonian satrap when assassinated some time between 321 and 315 B.C. See INDIA, vol. xii. pp. 786, 787, and PERSIA, vol. xviii. p. 586. His cousin, also named Porus, with whom he was on bad terms, ruled over Gandaris beyond the Hydraotes (Ravi), and was subdued by Hephæstion.

POSEIDON, the ancient Greek god of the sea and of water generally, was fabled to be the son of Cronus and Rhea, and brother of Zeus and Pluto. When the three brothers deposed their father Cronus the kingdom of the sea fell by lot to Poseidon. With his wife, Amphitrite, he dwelt in the depths of the sea; at Ægæ he had a golden house beneath the waves. In his hand he bore a trident (a three-pronged fish-spear), wherewith he lashed the sea into fury. But, while he caused storms and shipwrecks, he could also send favouring winds. He was the god of navigation, adored by all who sailed the sea. His temples stood especially on headlands and isthmuses. As god of the sea he disputed with other deities for the possession of the land—with Athene for Athens and Troezen, with Helios for Corinth, with Hera for Argos, with Zeus for Ægina, &c. Earthquakes were thought to be produced by Poseidon shaking the earth,—hence his epithet of

"Earth-shaker," and hence he was worshipped even in inland places, like Apamea in Phrygia, which had suffered from earthquakes. Hence also may have arisen the custom in some places of sacrificing moles to him. The great sea-wave which often accompanies an earthquake was also his work; the destruction of Helice in Achaia by such a wave (373 B.C.) was attributed to his wrath. Once when an earthquake shook the ground where a Spartan army was encamped, the whole army sang a hymn to Poseidon. The island of Delos was thought to have been raised by him from the bottom of the sea, and in 237 B.C., when a new island appeared between Thera and Therasia, the Rhodians founded a temple of Poseidon on it. Thessaly was said to have been a lake until this god opened a way for the waters through the Vale of Tempe. Poseidon was also the god of springs, which he produced by striking the rock with his trident, as he did on the acropolis of Athens when he was disputing with Athene for the sovereignty of Athens. This dispute was represented on the western pediment of the Parthenon. As he gave, so he could withhold springs of water; thus the waterless neighbourhood of Argos was supposed to suffer from his anger. Black bulls were sacrificed to him; in Ionia and Thessaly bull-fights took place in his honour; at a festival of his at Ephesus the cupbearers were called "bulls," and the god himself was surnamed "Bull Poseidon." The horse was

especially associated with his worship; he was said to have produced the first horse by striking the ground in Thessaly with his trident. At a fountain in Argolis horses bitted and bridled were sacrificed to him by being drowned in the water, and similarly Sextus Pompeius sought to propitiate him by throwing horses into the sea. He bore the surname of "Horse Neptune," and was regarded as the tamer as well as the creator of the steed. His worship was thought by Herodotus to have been derived from the Libyans. It had special seats in Thessaly, Bœotia, and the Peloponnesus. He had a famous cave-like temple at Tænarum in Laconia. On the island of Tenos he was worshipped as the physician, and crowds gathered from the neighbouring islands to offer sacrifice. At Mycale in Asia Minor the Panionium, or place of general assembly of the Ionian Greeks, was sacred to him. In the Trojan War Poseidon sided with the Greeks because he had been cheated of his reward by Laomedon, the former king of Troy, for whom he had built the city walls. The offspring of his numerous amours were mostly wild and cruel like the sea; such were the Læstrygones, Polyphemus, Cycnus, Antæus, Busiris, Procrustes, Sciron, and Orion. Alcinous, king of the seafaring Phæacians in the *Odyssey*, traced his lineage to Poseidon. By far the most famous of the festivals of Poseidon was that celebrated every second year on the Isthmus of Corinth and hence called the "Isthmian festival" (see vol. x. p. 65). Pine trees were sacred to Poseidon; a row of them stood close to his temple on the isthmus. Amongst the Ionians the stormy month which precedes the winter solstice was called by the name of Poseidon. He was described as dark-haired, broad-breasted, and blue-eyed. In works of art he appeared holding a trident and with a dolphin on his hand or under his feet; sometimes he was represented riding a bull, a horse, or a sea-horse, or in a chariot, often surrounded by the Tritons, Nereids, and other fabulous creatures of the sea. There were colossal statues of him at Helice in Achaia, on the Isthmus of Corinth (set up by the Greeks after the Persian wars), and at Tenos. The derivation of his name is uncertain; some refer it to the same root as *πότος*, *ποταμός*, &c.; others compare *πότνια*. In modern Greece St Nicholas has taken the place of Poseidon as patron of sailors. But the Zacynthians have a special sea-god, half man, half fish, who dwells under the sea, rides on dolphins or in a car drawn by dolphins, and wields a trident. He seems to combine the attributes of Poseidon and Nereus. For the Roman sea-god, see NEPTUNE.

POSEN, a province in the east of Prussia, with an area (11,180 square miles) nearly equal to that of Belgium, is bounded on the N. by the province of Prussia, on the E. by Russian Poland, on the S. by Silesia, and on the W. by Brandenburg. It belongs physically to the great north German plain, and consists of a low plateau intersected by the beds of the Netze, the Warthe, and the Odra. The three rivers just named drain into the Oder, but part of the province falls within the basin of the Vistula, which forms the frontier for a short distance on the north-east. The surface of the whole district is dotted with small lakes and ponds, and there are many broad fens and marshes. The soil on the whole is light and sandy, but much of the land reclaimed in the boggy districts is very fertile. Upwards of 61 per cent. of the area is under cultivation, while 13 per cent. is occupied by pasture and meadows and 20 per cent. by forests. The principal crops are wheat, rye, oats, barley, potatoes, and hops (compare PRUSSIA); the vine is cultivated to some extent in the south-west corner, and tobacco is also grown. The marshy tracts often afford excellent pasture and support large numbers of cattle, sheep, and goats. The mineral resources of the province are practically restricted to brown coal and salt,

about 26,000 tons of the former and 75,000 tons of the latter being raised in 1882. The industry is confined to a few points, and is of comparatively little importance. Besides beer and brandy, the chief products are machinery, cloth, tobacco, and bricks. Trade, carried on briskly in timber and agricultural produce, is facilitated by the network of navigable rivers and canals. Both industry and trade are somewhat cramped by the duties imposed at the Russian frontier. The population of the province in 1880 was 1,703,397, including 1,112,962 Roman Catholics, 532,498 Protestants, and 56,609 Jews. The Roman Catholics are mainly Poles, of whom there are about 950,000 in Posen, while the great bulk of the 750,000 Germans are Protestants. About 65 per cent. of the population is returned as "rural" in spite of the large number of so-called "towns," only seven of which, however, have more than 10,000 inhabitants. The largest are Posen and Bromberg. The province of Posen enjoys the unenviable distinction of being the worst educated corner of the German dominions, a fact illustrated by the high ratio of illiterate recruits (9.75 per cent. in 1882-83). It is represented in the German reichstag by fifteen and in the Prussian parliament by twenty-nine deputies.

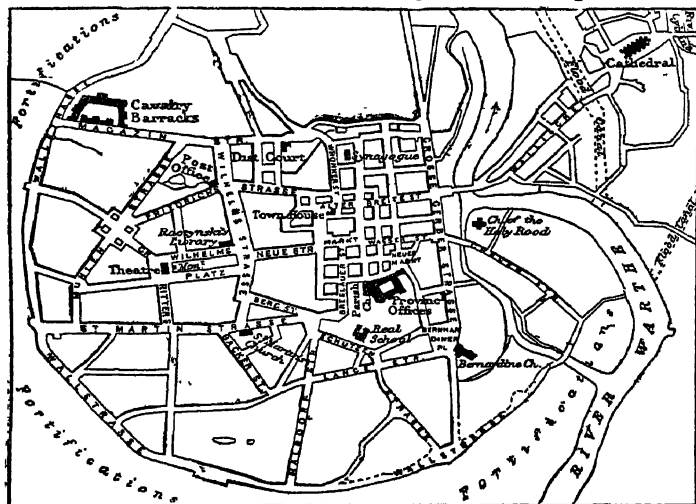

History.—The history of the district of Posen, comprehending great part of the cradle of the old kingdom of Poland, including its most ancient capital (Gnesen), falls properly within the scope of the article POLAND (*q.v.*). Its political connexion with Prussia began in 1772, when the districts to the north of the Netze fell to the share of that power in the first partition of Poland. The rest followed in 1793, and was united with the Netze district to form the province of South Prussia. After the peace of Tilsit Posen was incorporated with the grand-duchy of Warsaw, but in 1815 it reverted to Prussia under the style of the "grand-duchy of Posen." In 1848 the Polish inhabitants of the province revolted and had to be put down by force; and a thoroughly harmonious union of the two elements of the population is still unattained.

The tide of German immigration into Posen began at an early period and flowed very strongly in the 13th and following centuries. The industrious German settlers were heartily welcomed by the Polish nobles and were the founders of most of the towns, in which they lived after their own customs and were governed by their own laws. They established the few manufactures of which the district can boast, introduced the cultivation of hops, reclaimed the waste soil, and did much to improve agriculture generally. In the 16th century Protestantism was widely diffused by their means. A strong reaction, however, set in in the following century, and persecution of the Protestants went hand in hand with the ravages of war in hastening the political, intellectual, and agricultural decline of the territory. By the 18th century the burghers had sunk to the level of "städtische Bauern," or peasants with municipal privileges, and poverty and misery were widely spread. The Prussian rule, in spite of many defects, proved so beneficial that even Napoleon was compelled to praise it.

Posen contains a numerous Polish noblesse, many of the members of which are very poor. A double transformation is going on in the ownership of the ground, the large estates passing into the hands of the peasants and Polish proprietors giving place to German. A few years ago between 60 and 70 per cent. of the soil was occupied by "latifundia," while at present it is pretty equally divided between those and peasant holdings. In the four years 1878-81, inclusive, the land in the possession of Germans increased at the expense of Polish landowners by upwards of 100,000 acres. The peasant-farmers are generally deeply in debt, partly owing to the educational and communal burdens, but mainly owing to the pernicious custom of "Leibgedinge," according to which an able-bodied man in the prime of life will give up his holding in return for an annuity from his successor. In some instances two annuitants of this kind are found living on the same small patch of ground in addition to the actual cultivator.

POSEN (Polish, *Poznań*), capital of the above province, the seat of a Roman Catholic archbishop, and the headquarters of a corps of the German army, is situated at the confluence of the Cybina and Warthe, 150 miles to the east of Berlin and 90 miles to the north of Breslau. It is a fortress of the first rank and of great strategic importance; the works consist of a citadel and inner line of bastions, and an outer circle of twelve detached forts. The principal part of the town lies on the west bank of the Warthe, and comprises the so-called Altstadt and the

well-built modern quarter that has sprung up under the Prussian régime. On the other bank is the Wallischei, a poor district inhabited by Poles. Among the older buildings none calls for remark except the town-house, a quaint specimen of the Slavonic adaptation of Romanesque forms. The chief modern buildings are the various military and public offices, the law courts, the theatre, the real school, and the Raczyński library. The churches are devoid of architectural interest, but the cathedral contains numerous interesting objects of art, including two bronze-gilt statues

Plan of Posen.

of the first Christian kings of Poland, by Rauch. The manufactures of Posen are multifarious enough, including machinery, carriages, tobacco, copper boilers and vats, military requisites, chemicals, &c.; but there is nothing that can be called a staple industry. A lively trade is carried on in the agricultural products of Russia and Poland, and several well-attended fairs and markets are held. In 1880 Posen contained 65,713 inhabitants, including 35,725 Roman Catholics, 22,869 Protestants, and 7063 Jews. The German inhabitants are at present considerably more numerous than the Poles, though it would seem that the latter have increased in a greater ratio since 1875. The Jewish element is stronger here (10·7 per cent.) than in any other town in Germany. The garrison consists of 7000 men.

Posen, one of the oldest towns in Poland and the residence of some of the early Polish princes, became the seat of a Christian bishop towards the end of the 10th century. The original settlement was on the east bank of the Warthe, but the new or German town, established on the west bank about the year 1250, soon became the more important half of the double city. Posen was a royal free town, and was directly represented in the Polish diet down to 1733. In the Middle Ages it became a great depôt of the trade between Germany and the west of Europe on the one hand and Poland and Russia on the other. Numerous foreign merchants took up their abode here, including a strong colony of Scotsmen, who exported raw produce to Edinburgh. The town attained the climax of its prosperity in the 16th century, when its population is variously estimated at from 30,000 to 80,000. The intolerance shown to the Protestants, the troubles of the Thirty Years' War, the visitation of the plague, and other causes, however, soon conspired to change the state of affairs, and in the 18th century the town had only 5000 inhabitants. New life was infused into it on its annexation by Prussia at the second partition of Poland, and since then its progress has been limited only by its position as a fortress. The relations of the German and Polish elements of the population continue to be somewhat strained.

POSITONIUS, a distinguished Stoic philosopher, the most learned man of his time (c. 130-50 B.C.) and perhaps of all the school; by birth a Syrian from Apamea, a pupil of Panætius, he spent after his teacher's death many years in travel and scientific researches in Spain (particularly at Gades), Africa, Italy, Gaul, Liguria, Sicily, and

on the eastern shores of the Adriatic. When he settled as a teacher at Rhodes his fame attracted numerous scholars; next to Panætius he did most, by writings and personal intercourse, to spread Stoicism in the Roman world; he became well known to many of the leading men, as Marius, Rutilius Rufus, Pompey, and Cicero. The last-named studied under him (78-77 B.C.), and speaks as his warm admirer and personal friend.

Strabo mentions him as a contemporary. The date of his birth has not been fixed; it may have been 135, 130, or 125 B.C.; according to Lucian, he lived to be eighty-four. He visited Rome—e.g., in 86 B.C. on an embassy; but it is doubtful if he ever resided there as a teacher. His works, now lost, were written in an attractive style and proved a mine of information to later writers. The titles and subjects of more than twenty of them are known. In common with other Stoics of the middle period, he displays eclectic tendencies. His admiration for Plato led him to write a commentary on the *Timæus*; in another way it is shown by important modifications which he made in psychological doctrine. Unquestionably more of a polymath than a philosopher, he appears to us uncritical, or credulous even, and superficial. But at the time his spirit of inquiry provoked Strabo's criticism as something alien to the school (τὸ ἀπιολογικὸν καὶ τὸ ἀριστοτελεῖον, ὅπερ ἐκκλινουσιν οἱ ἡμέτεροι). In natural science he took a genuine interest, as his contributions to geography, natural history, mathematics, and astronomy sufficiently attest. He sought to determine the distance and magnitude of the sun, to calculate the diameter of the earth and the influence of the moon on the tides. His history of the period from 146 to 88 B.C., in fifty-two books, must have been a valuable storehouse of facts. Cicero, who submitted to his criticism the memoirs which he had written in Greek of his consulship, made use of writings of Posidonius in *De Natura Deorum*, b. ii., and *De Divinatione*, b. i., and the author of the pseudo-Aristotelian treatise *De Mundo* also borrowed from him.

Zeller, *Philosophie der Griechen*, iii. 1, 570-584 (in Eng. trans., *Eclecticism*, 56-70); C. Müller, *Fragmenta Historicorum Græcorum*, iii. 245-298; J. Bake, *Posidoni Rhodii Reliquiæ*, Leyden, 1810 (a valuable monograph); R. Scheppegg, *De Posidonio rerum gentium terrarum scriptore*, Berlin, 1869; R. Hirzel, *Untersuchungen zu Ciceros philosophischen Schriften*, i. 191 sq.; ii. 257 sq., 325 sq., 477-535, 756-789; iii. 342-378 (Leipzig, 1877). See STOICISM.

POSITIVISM, or POSITIVE PHILOSOPHY. See COMTE.

POSSESSION is a legal term derived from Roman law. The Roman conception of possession has been generally adopted, but the Roman deductions from the conception have not been universally followed. The subject of possession, in itself a difficult one, has become more difficult owing to the various senses in which the term has been interpreted. Thus it has been said to be either a right or a fact conferring a right, or both together. The latter is the view of Savigny, the leading authority upon the subject (*Recht des Besitzes*, translated by Sir Erskine Perry, 1848). Further, there is a want of agreement among legal writers as to the amount of right or rights that it confers. All that can be said with safety is that possession stands in a position intermediate between simple detention and absolute ownership, and that it implies two elements, a physical and a mental one,—physical detention and mental intention to hold the thing possessed as one's own. In the words of the *Digest*, "Apiscimur possessionem corpore et animo, neque per se animo aut per se corpore" (xli. 2, 3, 1). The difficulties which have been stated being borne in mind, the definition of Professor Hunter may be accepted as being at least as good as any other that has been suggested: "Possession is the occupation of anything with the intention of exercising the rights of ownership in respect of it" (*Roman Law*, p. 209). Possession is inchoate or incomplete ownership; it is on its way to become ownership. In the case of the public domain of Rome (*ager publicus*) the possession was really the important matter, the *dominium* being practically of no value. Possession in Roman law was either *natural* or *civil*. The former was mere occupation, the latter such occupation as ripened by prescription into ownership. Possession exclusive against the world (including the true owner) was called "adverse possession." A servitude, such as a right of way, could not be held in true possession, but was said to be in "quasi-possession." The quasi-possessor had, however, possessory remedies.

In Roman law a broad distinction was drawn between possession and ownership (*dominium*).¹ They were protected by different remedies,—possession by interdict, ownership by action. This difference can only be explained by history. Here again, unfortunately, authorities differ. According to Savigny, a Roman citizen who had become a tenant of part of the *ager publicus* could not by any length of holding obtain more than a quasi-ownership, but one of which it would have been morally unjust to have deprived him. "The only legal remedies of which the tenants could avail themselves, if ejected or threatened with disturbance, were the possessory interdicts, summary processes of Roman law which were either expressly devised by the prætor for their protection, or else, according to another theory, had in older times been employed for the provisional maintenance of possessions pending the settlement of questions of legal right" (Maine, *Ancient Law*, ch. viii.). Savigny regards the protection of possession as an extension of the protection of the person. The same view was taken by the English Court of Exchequer in *Rogers v. Spence*, 13 Meeson and Welsby's Reports, 581. According to Professor Hunter (*Roman Law*, pp. 206, 221), Savigny overlooked the needs of aliens. It was the needs of aliens, incapable of the full proprietary rights of Roman citizens, that led to the invention by the prætor of a means of giving them equitable rights in the land, and protecting them in the enjoyment of these rights. Savigny attributes only two rights to possession in Roman law—acquisition of ownership by possession for a given time (*usucapio*, *longi temporis possessio*) and protection of possession from disturbance (*interdictum*). Others have included further rights,—*inter alia*, the right to use force in defence of possession, and the right to have the burden of proof, in a contest as to the title, thrown upon the adversary: "In pari causa possessor potior haberi debet." The position of the possessor in Roman law was a very strong one. If a *bona fide* possessor, he could bring an action for *furtum* even against the owner; if a *mala fide* possessor of land, he was so far protected that he could not be ejected by force. A *mala fide* possessor of movables could, however, acquire no rights.²

It has been already stated that there is both a physical and a mental element in the conception of possession. This does not necessarily mean that corporal contact is in all cases requisite, or that the intention to hold the thing possessed as one's own may not be abandoned for a time. The control may be potential as well as actual. An estate may be possessed without the possessor going upon the land at all, and the possession of goods may be given by delivering the key of the warehouse in which they are stored. In international law the possession of part as giving the right to the whole has been of great importance. The possession of the coast of a newly-discovered country gives a right to the inland territory within certain limits (see Twiss, *International Law*, vol. i. p. 170). Where goods are pledged or bailed for a specific purpose the intention of the pledgor or bailor to hold them as his own is suspended during the existence of the limited right of the pledgee or bailee, to whom a fragment of the possession has passed. In Roman law the pledgor had *possessio ad usucapionem*, the pledgee *possessio ad interdicta*. The possession of the pledgee or bailee has been called "derivative possession." Possession may be exercised through another ("animo nostro, corpore alieno"), as through a

servant, who has not true possession.³ Possession so exercised has been called "representative possession." As soon as the representative determines to assume control on his own behalf or to submit to the control of another, the possession of the principal is gone. Possession may be transferred or lost. It is lost when either the *corpus* or the *animus* (to use the terms of Roman law) ceases to exist. It may be lost by the representative in cases where the principal might have lost it.

In both Roman and English law the possessory tended to supersede the proprietary remedies from their greater convenience,—that is to say, the plaintiff based his claim or the defendant his right upon possession rather than property. The English possessory action may have been directly suggested by the interdict. Bracton (103b) identifies the assise of novel disseisin, the most common form of possessory action, with the interdict *unde vi*. In England ejectment had practically superseded other real actions before the latter were (with the exception of dower, writ of dower, and *quare impedit*) expressly abolished by 3 and 4 Will. IV. c. 27, s. 36. The action for the recovery of land, introduced by the Judicature Acts, is the modern representative of the action of ejectment. The right of a party to recover possession is enforced by a writ of possession.

Possession gives in English law, speaking generally, much the same rights as in Roman law. Thus it serves to found a title (see LIMITATION, PRESCRIPTION), and to throw the onus of proof upon the claimant. In an action for the recovery of land the defendant need only allege that he is in possession by himself or his tenant, and (where such an allegation is necessary) that he had no notice to quit. The chief differences between Roman and English law, arising to some extent from the differences in the history of the two systems, are that the former did not give to derivative possessors (except in the case of pledge) the remedies of possessors, as does English law, and that Roman law is stricter than English in requiring that possession to found *usucapio* should (except in the case of *jus aquæ ducendæ*) be *ex justo titulo*, or under colour of right (see PRESCRIPTION). There is one case of constructive possession which is peculiar to English law,—that is, where possession is said to be given by a deed operating under the Statute of Uses (see "Orme's Case," *Law Reports*, 8 Common Pleas, 281).

In English law the doctrine of possession becomes practically important in the following cases. (1) Possession serves as a convenient means of division of estates (see REAL ESTATE). One of the divisions of estates is into estates in possession and estates in reversion or remainder. It also serves as a division of PERSONAL ESTATE (*q.v.*). A chose in action is said to be reduced into possession when the right of recovery by legal proceedings has become a right of enjoyment. (2) Possession gives a title against a wrongdoer. In the case of real property it is regarded as *prima facie* evidence of seisin.⁴ In the case of personal property the mere possession of a finder is sufficient to enable him to maintain an action of trover against one who deprives him of the chattel⁵ (see the leading case of *Armory v. Delamirie*, 1 Strange's Reports, 504). (3) What is called "unity of possession" is one of the means whereby an easement is extinguished. Thus the owner of close A may have had a right of way over close B, while the latter belonged to a different owner. If the two closes come to be owned

³ Much of the law of master and servant is based upon the Roman law of master and slave. The servant, like the slave, has not possession of his master's goods even though they are in his custody, unless, indeed, the circumstances are such that he ceases to be a servant and becomes a bailee.

⁴ "Seisin" and "possession" are used sometimes as synonyms, as generally by Bracton; at other times they are distinguished: thus there can be possession of a term of years, but no seisin (Noy, *Maxims*, p. 2). It seems doubtful, however, how far in English law a tenant for years has true possession, for he is in law only a bailiff or servant of the landlord. But he certainly has possessory remedies, like the quasi-possessor in Roman law.

⁵ Compare the *Code Napoléon*, art. 2279: "En fait de meubles la possession vaut titre."

¹ The distinction is very important, as it affects the contract of sale. The contract was not to transfer ownership, as in English law, but only *vacua possessio*.

² This does not agree with English law, where in certain cases a thief can give a good title to stolen goods, though he has no title himself.

by the same person, the right of way is extinguished, but may under certain circumstances revive on the separation of the ownership. (4) Possession is very important as an element in determining the title to goods under 13 Eliz. c. 5, the Bills of Sale Act, 1878 (41 and 42 Vict. c. 31, ss. 4, 8), and the Bankruptcy Act, 1883 (46 and 47 Vict. c. 52, s. 44). It may be said that as a general rule retention of possession by the transferor on an absolute assignment or a colourable delivery of possession to the transferee is strong *prima facie* evidence of fraud. "Apparent possession" is defined by section 4 of the Bills of Sale Act. (5) Possession of goods or documents of title to goods is generally sufficient to enable agents and others to give a good title under the Factors' Acts (see FACTORS). (6) In criminal law the question of possession is important in founding the distinction between larceny and embezzlement. If the goods are in the possession of the master and he gives them to the custody of his servant for a specific purpose, and the servant steals them, it is larceny; if they have never come into the master's possession, as if a clerk receives money on his master's behalf, it is embezzlement. Recent possession of stolen goods is always regarded as a presumption that the person in whose possession they are stole them or received them knowing them to have been stolen. In the case of a charge of receiving stolen goods evidence may be given that there was found in the possession of the accused other property stolen within the preceding period of twelve months, 34 and 35 Vict. c. 112, s. 19. (For possession in criminal law, see Stephen, *Digest of the Criminal Law*, note xi.). (7) Actions of possession of ships fall within the jurisdiction of the Admiralty Division. This jurisdiction in the case of British vessels depends upon the Admiralty Court Act, 1861 (24 Vict. c. 10, s. 8), in the case of foreign vessels (in which the jurisdiction is rarely exercised) upon the general powers of the court as a maritime court.

The doctrines of adverse possession (in the old English sense, which was not identical with the Roman law, for the real owner must have actually or by fiction been dispossessed) and of *possessio fratris*

are now of only antiquarian interest. The Statutes of Limitation, 3 and 4 Will. IV. c. 27 and 37 and 38 Vict. c. 57, have superseded the first. The only question now is, not whether possession has been adverse or not, but whether twelve years have elapsed since the right accrued (see LIMITATION). The maxim "*possessio fratris de feodo simplici sororem facit esse heredem*" (Coke upon Littleton, 14b) has been altered by the rules of descent introduced by 3 and 4 Will. IV. c. 106, under which descent is traced from the purchaser. At one time possessory suits were occasionally maintained in England, and more frequently in Ireland, for the quieting of possession after proof of three years' possession before the filing of the bill. But such suits are now obsolete (see Neill v. Duke of Devonshire, 8 Appeal Cases, 146). There was one characteristic case in old English law in which possession was maintained by means of what was called "continual claim," made yearly in due form, where the person having the right was prevented by force or fear from exercising it (Coke upon Littleton, 253b). Continual claim was abolished by 3 and 4 Will. IV. c. 27, s. 11.

Scotland.—In Scotland, possessory actions still exist *eo nomine*. Actions of molestation, of removing, and of mails and duties are examples. A possessory judgment is one which entitles a person who has been in possession under a written title for seven years to continue his possession (Watson, *Law Dict.*, s.v. "Possessory Judgment").

United States.—Here the law in general agrees with that of England. But in Maryland, New Hampshire, North Carolina, and Vermont the doctrine of *possessio fratris* apparently still exists (Bouvier, *Law Dict.*, "Possessio Fratris"). Possessory rights are taxed in some of the States. Louisiana follows Roman law closely. Possession of incorporeal rights (to use the unscientific language of the Code) is called quasi-possession, and the division of possession into natural and civil is maintained (Civil Code, §§ 3389-3419).

In addition to the authorities cited may be mentioned Smith, *Dict. of Antiquities*, s.v. "Possessio"; Markby, *Elements of Law*, ch. viii.; Holland, *Elements of Jurisprudence*, ch. xi.; Holmes, *The Common Law* (lect. vi.). (J. Wt.)

POST-OFFICE

THE germ of the modern postal systems of the world is to be looked for, obviously, in the earliest organized establishment of a staff of Government couriers. When, or under what precise circumstances, such an establishment was first made available by a state for the carriage of the letters of private persons there is no satisfactory evidence to show. That there must have been, even in early times, a connexion, more or less authorized, between the transmission of public and of private correspondence is highly probable. Even financial reasons would soon dictate a formal permission to Government couriers to carry letters for individuals—under regulation and restriction, of course—although at the outset such a practice may well have been rather connived at than allowed. In the postal system of Spain and the German empire there is express record of such a permission in the month of April 1544; and within fifteen or sixteen years that permission had grown into a legalized and regulated monopoly, whence the counts of Taxis drew part of their profits as postmasters-general. For the purposes of this article, however, it is enough to note that in Great Britain existing private letters of the 15th century—some, perhaps, of the 14th—bear endorsements which show that they were conveyed by relays of men and horses maintained under the control of the Government, and primarily intended for its special service. In several Continental states the universities had inland postal establishments of a rudimentary sort at an early date. The university of Paris, for example, organized a postal service almost at the beginning of the 13th century, and it lasted in a measure until the year 1719. In various parts of Europe mercantile guilds and brotherhoods were licensed to establish posts for commercial purposes. But everywhere—as far as the accessible evidence extends—foreign posts were under state control.

GREAT BRITAIN.

Early History (c. 1533-1836).

As early as the middle of the 13th century entries

occur in the wardrobe accounts of the kings of England of payments to royal messengers—variously designated "cokinus," "nuncius," or "garcio"—for the conveyance of letters to various parts of the country. In the supervision of these royal messengers lies the germ of the office of postmaster-general. The first English postmaster of whom a distinct account can be given is Sir Brian Tuke, ^{Sixteenth century.} who is described (1533) in the records as "Magister Nunciorum, Cursorum, sive Postarum," "both in England and in other parts of the king's dominions beyond the seas." But long subsequent to this appointment of a postmaster-general the details of the service were frequently regulated by proclamations and by orders in council. Thus, in the curious collection of royal proclamations in the library of the Society of Antiquaries there is one of Philip and Mary (undated, but apparently of 1555) which regulates the supply of horses for the conveyance of letters to Dover.¹ Again, in July 1556 the lords of the council ordered "that the postes betweene this and the Northe should eche of them keepe a booke, and make entrie of every lettre that he shall receive, the tyme of the deliverie thereof unto his hands, with the parties names that shall bring it unto him." Much of the business of the foreign postal service to and from England during the earlier years of Queen Elizabeth was managed by the incorporated "merchant strangers," who appointed a special postmaster amongst themselves. When that office chanced to fall vacant in 1568 they quarrelled about a successor; and the quarrel cost them their privilege.²

The accession of James I. to the English throne, by necessitating a more frequent communication between London and Scotland, led to improvements in the postal

¹ In his able account of this remarkable collection the late Mr Robert Lemon has overlooked the proclamation here referred to, probably from its want of a date, his own arrangement being chronological.

² F. Windebank to Sir W. Cecil: "All the Italians were unwilling to give their voices to Raphael, . . . but inclined to favour Godfrey" (*Dom. Cor. Eliz.*, xlviii. § 65, State Paper Office). Raphael was a German, Godfrey an Englishman.

service. Some years earlier special posts had been established by the magistrates of certain Scottish towns for the conveyance of their despatches to and from the court. Thus in 1590 a messenger was appointed by the magistrates of Aberdeen with the title of "council-post."¹ The new royal orders of 1603 directed (1) that the postmasters at the various stages should enjoy the privilege of letting horses to "those riding in post (that is to say) with horn and guide," by commission or otherwise, and to that end they were charged to keep or have in readiness a sufficient number of post-horses; (2) that the lawful charge for the hire of each horse should be, for public messengers, at the rate of 2½d. a mile, "besides the guides' groats," private travellers being left to make their own agreements. Finally, it was directed that every postmaster should keep at least two horses for the express conveyance of Government letters, and should forward such letters within a quarter of an hour of their receipt, and that the posts should travel at the rate of not less than 7 miles an hour in summer and 5 miles in winter.²

In 1607 the king granted to James Stanhope, first Lord Stanhope of Harrington, and to his son Charles Stanhope, afterwards second Lord Stanhope, jointly and to the survivor of them, the postmastership of England under the title of "Master of the Posts and Messengers," with a fee of 100 marks a year, together with all "avails and profits" belonging to the office. In 1619 a separate office of "postmaster-general of England for foreign parts" was created, by new letters patent, in favour of Matthew de Quester³ and Matthew de Quester the younger. The new office was regarded by the existing postmaster-general, Charles, Lord Stanhope, as an infringement of his own patent. A long dispute ensued in the King's Bench and before the Lords of the Council.⁴ In 1626 by an order in council liberty was granted to all companies of merchants, including the Merchants Adventurers, to send their letters and despatches by messengers of their own choosing. A year afterwards this liberty was revoked, except for the Company of Merchants Adventurers. Lord Stanhope, however, continued to carry letters abroad by his agents, and obtained a warrant prohibiting De Quester from interfering. It shows strikingly the confusion of postal affairs at this period to find a statement addressed to the privy council by the postmasters of England to the effect that they had received no payments "ever since the last day of November 1621 till this present time, June 1628,"—the arrears amounting to £22,626.

The rights of the postmasters were also infringed by private individuals, as by one Samuel Jude in 1629 in the west of England.⁵ In 1632 the foreign postmastership was assigned by the De Questers to William Frizell and

Thomas Witherings. Letters-patent were granted to them Witherings jointly, 15th March 1633.⁶ Witherings took the labouring oar, and probably ought to rank as the first of the many conspicuous postal reformers in the long history of the British post-office. Under him one Richard Poole obtained a special postmastership for the service of the court. A petition subsequently presented by him to the House of Lords contains curious proof of the jealousies which Witherings's successful administration of his office excited. Among the earliest measures of improvement taken under the new patent was an acceleration of the Continental mail service. For this purpose the patentees made a contract with the count of Thurn and Taxis, hereditary postmaster of the empire and of Spain. At this time there was still but one mail weekly between London, Antwerp, and Brussels, and the transit occupied from four to five days. By a subsequent contract with Count Thurn two mails weekly were secured and the transit made ordinarily in two days.⁷ In June 1635 Witherings submitted to the king a proposal (still preserved in the State-Paper Office) "for settling of staffets or packet-posts betwixt London and all parts of His Majesty's dominions, for the carrying and re-carrying of his subjects' letters," which contains some curious incidental notices of the state of the internal communication of the kingdom at that time. The nett charge to the crown of the existing posts is stated to be £3400 per annum. Letters, it is said, "being now carried by carriers or footposts 16 or 18 miles a day, it is full two months before any answer can be received from Scotland or Ireland to London. If any of His Majesty's subjects shall write to Madrid in Spain, he shall receive answer sooner and surer than he shall out of Scotland or Ireland." By the new plan it was proposed that all letters for the northern road should be put into one "portmantle," and directed to Edinburgh, with separate bags directed to such postmasters as lived upon the road near to any city or town corporate. The journey from London to Edinburgh was to be performed within three days. The scheme was approved of on 31st July 1635, the proclamation establishing eight main postal lines,—namely, the great northern road, to Ireland by Holyhead, to Ireland by Bristol, to the marches of Wales by Shrewsbury, to Plymouth, to Dover, to Harwich, and to Yarmouth. The postage of a single letter was fixed at 2d. if under 80 miles, 4d. if between 80 and 140 miles, 6d. if above 140 miles, 8d. if to Scotland. And it was further provided that from the beginning of this service no other messengers or footposts should carry letters to any places so provided, except common known carriers, or a particular messenger "sent on purpose with a letter by any man for his own occasions," or a letter by a friend, on pain of exemplary punishment.⁸ In February 1638 another royal proclamation ratified an agreement between Witherings and De Noveau, postmaster to the French king, for the conveyance of the mails into France by Calais, Boulogne, Abbeville, and Amiens.⁹

But in 1640 the active postmaster was accused of divers abuses and misdemeanours, and his office sequestered into the hands of Philip Burlamachi of London, merchant, who was to execute the same under the inspection of the principal secretary of state.¹⁰ Witherings then assigned his patent to Robert Rich, earl of Warwick, and a long contest

⁴ These disputes were much embittered by the growing jealousies of English against foreign merchants. The proofs of this in the state correspondence of Elizabeth's day are abundant, but there were many statesmen who took larger views. See, e.g., John Johnson's "Brief Declaration for the . . . erecting and maintaining of the Staple . . . in England" (June 1582), *Dom. Corresp. Eliz.*, cliv., No. 30; and compare the same writer's "Discourse for the repairing the decayed State of the Merchants," &c. (22d July 1577), *ib.*, cxiv., No. 39, with Leake's "Discourse," &c., of the same year (*ib.*, cxi. 1 sq.), and with John Hales's "Letter to Sir W. Cecil" (20th March 1559), *ib.*, iii., where he describes the merchant strangers as being "spies for foreign princes," and with Cecil's "Reasons to move a Forbearing of the Restitution of the Intercourse to Antwerp" (1564), *ib.*, xxxv., No. 38 (in Rolls House).

ensued in both Houses of Parliament. The sequestration was declared by a vote in parliament in 1642 to be illegal. Nevertheless the dispute gave repeated occupation to both Houses during the period from 1641 to 1647, and was diversified by several affrays, in which violent hands were laid upon the mails. In 1643 the post-office yielded only £5000 a year. In 1644 the Lords and Commons by a joint ordinance appointed Edmund Prideaux "to be master of the posts, messengers, and couriers." In 1646 the opinion of the judges was taken on the validity of Witherings's patent (assigned to Lord Warwick), and they pronounced that "the clauses of restraint in the said patent are void and not good in law; that, notwithstanding these clauses be void, the patent is good for the rest."¹ It is evident, therefore, that any prohibition to carry letters must be by Act of Parliament, to have force of law.

In 1650 an attempt was made by the common council of London to organize a new postal system on the great roads, to run twice a week. This scheme they temporarily carried into effect as respects Scotland. But Mr Attorney-General Prideaux speedily obtained the intervention of the council of state. He urged on the council of state that, if the new enterprise were permitted, besides trenching on the rights of the parliament, some other means would have to be devised for payment of the postmasters. Both Houses resolved (1) that the offices of postmasters, inland and foreign, were, and ought to be, in the sole power and disposal of the parliament, and (2) that it should be referred to the council of state to take into consideration all existing claims in relation thereto. Of these there were no less than five under the various patents which had been granted and assigned. Thereupon the Protector was advised that the management of the post-office should be entrusted to John Thurloe by patent under the broad seal of the Commonwealth immediately upon the expiration of John Manley's existing contract. Thurloe was to give security for payment of the existing rent of £10,000 a year. Ultimately the posts, both inland and foreign, were farmed to John Manley for £10,000 a year, by an agreement made in 1653. Meanwhile, and pending the decision of the council upon the question so submitted to it, a remarkable step in postal reform was taken by an attorney at York, named John Hill, who placed relays of post-horses between that city and London, and undertook the conveyance of letters and parcels at half the former rates of charge. He also formed local and limited partnerships in various parts of the kingdom for the extension of his plan, which aimed to establish eventually a general penny postage for England, a twopenny postage for Scotland, and a fourpenny postage for Ireland. But the post-office was looked upon by the Government of the day as, first, a means of revenue, and secondly, a means of political espionage.² The new letter-carriers were

(literally) "trampled down" by Cromwell's soldiery. The inventor had a narrow escape from severe punishment. He lived to publish (1659) the details of his plan, at the eve of the Restoration, in a pamphlet entitled *A Penny Post: or a Vindication of the Liberty and Birthright of every Englishman in carrying Merchants and other Man's letters, against any Restraint of Farmers, &c.* It is very probable that this publication³ helped to prepare the way for those measures of partial but valuable and far-reaching reform which were effected during the reign of Charles II. The rates of postage and the rights and duties of postmasters were settled under the Protectorate by an Act of Parliament of 1657, c. 30. In 1659 the item, "by postage of letters in farm, £14,000," appears in a report on the public revenue.⁴

The Government of the Restoration continued to farm Under the post-office upon conditions very similar to those imposed by the Act of 1657, but for a larger sum. Henry II. Bishop was the first postmaster-general in the reign of Charles II., and he contracted to pay to the king a yearly rent of £21,500, these new arrangements being embodied in the Act 12 Charles II. c. 35, entitled "An Act for Erecting and Establishing a Post-Office." A clause proposing to frank all letters addressed to or sent by members of parliament during the session was, after considerable debate, ultimately rejected by the Lords. But the indenture enrolled with the letters-patent contained a proviso for the free carriage of all letters to or from the king, the great officers of state, and also the single inland letters only of the members of that present parliament during the continuance of that session. It also provided that the lessee should permit the secretaries of state for the time being, or either of them, from time to time, to have the survey and inspection of all letters at their discretion. Bishop was succeeded by Daniel O'Neill⁵ in 1662, on similar terms. In the consequent proclamation, issued on 25th May 1663, it was commanded that "no postmasters or other officers that shall be employed in the conveying of letters, or distributing of the same, or any other person or persons, . . . except by the immediate warrant of our principal secretaries of state, shall presume to open any letters or packets not directed unto themselves." In 1677 the general post-office comprised in the chief office, under Henry Bennet, earl of Arlington, as postmaster-general, seventy-five persons, and its profits were farmed for £43,000 a year. There were then throughout England and Scotland 182 deputy postmasters, and in Ireland 18 officers at the Dublin office and 45 country postmasters. "The number of letters missive," says a writer of the same year, "is now prodigiously great. . . . A letter comprising one whole sheet of paper is conveyed 80 miles for twopence. Every twenty-four hours the post goes 120 miles, and in five days an answer may be had from a place 300 miles distant."⁶

By an Act of the 15th Charles II. ("An Act for Settling the Profits of the Post-Office on H.R.H. the Duke of York, and his Heirs-Male"), and by a subsequent proclamation issued in August 1683, it was directed that the postmaster-general should "take effectual care for the conveyance of all bye-letters, by establishing correspondences . . . in all considerable market-towns with the next adjacent post-stage," and the rights of the postmasters as to hiring horses were again emphasized.

³ There is a copy in the library of the British Museum, from which Mr H. B. Wheatley has given the abstract quoted above.

² Some instructive illustrations of this may be seen (in the state-paper department of the General Record Office) among the correspondence between secretary Sir John Coke and Lord Conway, and also in many other state letters, as well after the outbreak of the great rebellion as before it. And there is in the Bodleian Library at Oxford (MS. Rawlinson, A. 477) a curiously minute account of the methods alleged to have been pursued in the systematic and periodical examination of letters entrusted to the post-office. The paper is not authenticated by any signature, and is undated. But it is an original document of the time of Charles II., addressed to Mr Bridgman, clerk of the council, and drawn up in order to recommend the adoption of a like practice, but with greater dexterity in the manipulation than was used by Dr Dorislaus and Samuel Morland, who, according to this narrative, formed the Cromwellian board of examiners for post-office letters, and who read without exception all that were addressed to foreign parts.

Dock-
wra's
London
penny
post.

It was during the possession of the post-office profits by the duke of York that a London penny post was established by the joint enterprise of William Dockwra, a searcher at the customs house, and of Robert Murray, a clerk in the excise office. The working-out of the plan fell to the first-named, and in his hands it gave in April 1680—although but for a short time—far more extensive postal facilities to the Londoners than even those so memorably afforded 160 years later by the plans of Sir Rowland Hill. The London of that day was small, and easily manageable. Dockwra carried, registered, and insured, for a penny, both letters and parcels up to a pound in weight and £10 in value. He took what had been the mansion of Sir Robert Abdy in Lime Street as a chief office, established seven sorting and district offices (thus anticipating one of the most recent improvements of the present time) and between 400 and 500 receiving-houses and wall-boxes. He established hourly collections, with a maximum of ten deliveries daily for the central part of the city, and a minimum of six for the suburbs. Outlying villages, such as Hackney and Islington, had four daily deliveries; and his letter-carriers collected for each despatch of the general post-office throughout the whole of the city and suburbs. Suits were laid against him in the court of King's Bench for infringing on the duke of York's patent, and the jealousies of the farmers eventually prevailed. The penny post was made a branch of the general post. Dockwra, after the Revolution of 1688, obtained a pension of £500 a year (for a limited term) in compensation of his losses. In 1697 he was made comptroller of the London office. Eleven years later his improvements were outvied by Charles Povey, the author of schemes for improving coinage, and also of a very curious volume, often wrongly ascribed to Defoe, entitled *The Visions of Sir Heister Ryley*. Povey took upon himself to set up a foot-post under the name of the "halfpenny carriage," appointed receiving-houses, and employed several persons to collect and deliver letters for hire within the cities of London and Westminster and borough of Southwark, "to the great prejudice of the revenue," as was represented by the postmaster-general to the lords of the treasury. Povey was compelled to desist.

Early
Scottish
postal
system.

At this period the postal system of Scotland was distinct from that of England. It had been reorganized early in the reign of Charles II., who in September 1662 had appointed Patrick Grahame of Inchbrakie to be postmaster-general of Scotland for life at a salary of £500 Scots. But it would seem from the proceedings of the Scottish privy council that the rights and duties of the office were ill defined; for immediately after the appointment of Grahame the council commissioned Robert Mein, merchant and keeper of the letter-office in Edinburgh, to establish posts between Scotland and Ireland, ordained that Linlithgow, Kilsyth, Glasgow, Kilmarnock, Dumboag, Ballantrae, and Portpatrick should be stages on the route, and granted him the sum of £200 sterling to build a packet-boat to carry the mail from Portpatrick to Donaghadee.¹

Early
colonial
posts.

The colonial post-office at this period was naturally more rudimentary still. Perhaps the earliest official notice of it is to be seen in the following paragraph from the records of the general court of Massachusetts in 1639. "It is ordered that notice be given that Richard Fairbanks his house in Boston is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither to be left with him; and he is to take care that they are to be delivered or sent according to the directions; and he is allowed for every letter a penny, and must answer all miscarriages through his own neglect in this kind." That court in 1667 was petitioned to make better postal arrangements, the petitioners alleging the frequent "loss of letters whereby merchants, especially with their friends and employers in foreign parts, are greatly damaged; many times the letters are imputed (?) and thrown upon the Exchange, so that those who will may take them up, no person, without some satisfaction, being willing to trouble their houses therewith." In Virginia the postal system was yet more primitive. The colonial law of 1657 required every planter to provide a messenger to convey the despatches as they arrived to the next plantation, and so on, on pain of forfeiting a hogshead of tobacco in default.

¹ Lang, *Historical Summary of the Post-Office in Scotland*, 4, 5.

The Government of New York in 1672 established "a post to goe monthly from New York to Boston," advertising "those that be disposed to send letters, to bring them to the secretary's office, where, in a lockt box, they shall be preserved till the messenger calls for them, all persons paying the post before the bagg be sealed up."² Thirty years later this monthly post had become a fortnightly one, as we see by the following paragraph in the *Boston News-Letter*. "By order of the postmaster-general of North America. These are to give notice, That on Monday night, the 6th of December, the Western Post between Boston and New York sets out once a fortnight, the three winter months of December, January, and February, and to go alternately from Boston to Saybrook, and Hartford, to exchange the mayle of letters with the New York Ryder; the first turn for Saybrook, to meet the New York Ryder on Saturday night the 11th currant; and the second turn he sets out at Boston on Monday night the 20th currant, to meet the New York Ryder at Hartford, on Saturday night the 25th currant, to exchange Mayles; and all persons that sends letters from Boston to Connecticut from and after the 18th inst. are hereby notified first to pay the Postage on the same."³ This office of postmaster-general for America had been created in 1692.

We have now traced the postal communications of different portions of the British empire from their earliest beginnings until the eve of the passing of the Act of the 9th of Queen Anne which consolidated them into one establishment, and which, as to organization, continued to be the great charter of the post-office until the date of the important reforms of 1838-50, mainly introduced by the energy, skill, and characteristic pertinacity of Sir Rowland Hill. The Act of Anne largely increased the powers of the postmaster-general. It reorganized the chief letter-offices of Edinburgh, Dublin, and New York, and settled new offices in the West Indies and elsewhere. It established three rates of single postage, viz., English, 3d. if under 80 miles and 4d. if above, and 6d. to Edinburgh or Dublin. It continued to the postmaster-general the sole privilege "to provide horses to persons riding post." And it gave, for the first time, parliamentary sanction to the power, formerly questionable, of the secretaries of state with respect to the opening of letters, by enacting that "from and after the first day of June 1711 no person or persons shall presume . . . to open, detain, or delay . . . any letter or letters . . . after the same is or shall be delivered into the general or other post-office, . . . and before delivery to the persons to whom they are directed, or for their use, except by an express warrant in writing under the hand of one of the principal secretaries of state, for every such opening, detaining, or delaying."

Nine years after the passing of the Act of Anne the Cross-cross-posts were farmed to the well-known "humble" road Ralph Allen,—the lover of peace and of humanity.⁴ Allen became the inventor of the cross-roads postal system, having made an agreement that the new profits so created should be his own during his lifetime. His improvements were so successful that he is said to have netted during forty-two years an average profit of nearly £12,000 a year.

The postal revenue of Great Britain, meanwhile, stood thus:—

TABLE I.—Gross and Nett Income, 1724-1774.

	Gross Produce.			Nett Revenue.		
	£	s.	d.	£	s.	d.
1724	178,071	16	9	96,339	7	5
1734	178,334	3	1	91,701	11	0
1744	194,461	8	7	85,114	9	4
1754	214,300	10	6	97,865	5	1
1764	225,326	5	8	116,182	8	5
1774	313,032	14	6	164,077	8	4

⁴ "Is there a variance? enter but his door,
Balked are the courts; the contest is no more."
Pope's "humble Allen" was also the "Allworthy" of Fielding.

Perman-
ent pen-
sions.

The system of burdening the post-office revenue with pensions, nearly all of which had not the slightest connexion with the postal service, and some of which were unconnected with any sort of service that can possibly be called public, was begun by Charles II., who granted to Barbara, duchess of Cleveland, £4700 a year, and to the earl of Rochester £4000 a year, out of that revenue. The example was followed until, in 1694, the list of pensions so chargeable stood thus:—

Earl of Rochester	£4,000	Lord Keeper	£2,000
Duchess of Cleveland	4,700	William Dockwra (until 1697)	500
Duke of Leeds	3,500		
Duke of Schomberg	4,000	Total	£21,200
Earl of Bath	2,500		

Queen Anne granted a pension of £5000 to the duke of Marlborough, charged in like manner. In March 1857 the existing pensions ceased to be payable by the post-office, and became chargeable to the consolidated fund.

Palmer's
mail-
coaches.

The first important and enduring impulse to the development of the latent powers of the post-office, both as a public agency and as a source of revenue, was given by the shrewdness and energy of the manager of the Bath theatre, John Palmer. Palmer's notice was attracted to the subject in October 1782. His avocations had made him familiar with that great western road which was still in such peculiar favour, alike with people of fashion and with the gentlemen of the highway. So habitual were the robberies of the post that they came to be regarded by its officials as among the necessary conditions of human affairs. They urged on the public the precaution of sending all bank-notes and bills of exchange in halves, and pointed the warning with a philosophical remark, that "*there are no other means of preventing robberies with effect*, as it has been proved that the strongest carts that could be made, lined and bound with iron, were soon broken open by a robber."

At this period, in addition to the recognized perils of the roads, the postal system was characterized by extreme irregularity in the departure of mails and delivery of letters, by an average speed of about 3½ miles in the hour, and by a rapidly-increasing diversion of correspondence into illicit channels. The nett revenue, which had averaged £167,176 during the ten years ending with 1773, averaged but £159,625 during the ten years ending with 1783. Yet, when Palmer suggested that by building mail-coaches of a construction expressly adapted to run at a good speed, by furnishing a liberal supply of horses, and by attaching an armed guard to each coach the public would be greatly benefited, and the post-office revenue considerably increased, the officials pertinaciously opposed the plan and maintained that the existing system was all but perfect. Lord Camden, however, brought the plan under the personal notice of Pitt. No sooner was the minister convinced of its merits than he insisted on its being tried. The experiment was made in August 1784, and its success exceeded all anticipation. The following table will show the rapid progress of the postal revenue under the new arrangements.

TABLE II.—*Gross and Nett Income, 1784-1805.*

Year.	Gross Income.			Nett Revenue.		
	£	s.	d.	£	s.	d.
1784	420,101	1	8	196,513	16	7
1785	463,753	8	4	261,409	18	2
1790	533,198	1	9	331,179	18	8
1795	745,238	0	0	414,548	11	7
1800	1,083,950	0	0	720,981	17	1
1805	1,817,842	0	0	944,882	8	4

It had been at first proposed to reward Palmer by a grant for life of two and a half per cent. on a certain proportion of the increased nett revenue, which would eventually have given him some £10,000 a year; but this proposition fell through, in consequence either of technical difficulties created by the Post-Office Act or of the opposition of the post-office authorities. Pitt, how-

ever, appointed Palmer to be comptroller-general of postal revenues, an office which was soon made too hot for him to hold. He obtained a pension of £3000 a year, and ultimately, by the Act 53 Geo. III. c. 157, after his case had received the sanction of five successive majorities against Government, an additional sum of £50,000. Every sort of obstruction was placed in the way of his reward, although nearly a million had been added to the annual public revenue, and during a quarter of a century the mails had been conveyed over an aggregate of some seventy millions of miles without the occurrence of one serious mail robbery.¹

Scotland shared in the advantages of the mail-coach system from Scottish the first. Shortly before its introduction the local penny post was and Irish set on foot in Edinburgh by Peter Williamson, the keeper of a post-coffee-room in the hall of Parliament House. He employed four office, letter-carriers, in uniform, appointed receivers in various parts of 1708-the city, and established hourly deliveries.² The officials of the 1801. post, when the success of the plan had become fully apparent, gave Williamson a pension, and absorbed his business, the acquisition of which was subsequently confirmed by the Act 34 Geo. III. c. 17. A dead-letter office was established in 1784. The entire staff of the Edinburgh post-office, which consisted in 1708 of seven persons, now comprised twenty-five, the cost of the office being £1406. In 1796 the number of functionaries had increased to forty, and the cost to £3278.³ But in Ireland the old state of things continued until the present century. In 1801 only three public carriages in the whole country conveyed mails. There were, indeed, few roads of any sort, and none on which coaches could travel faster than four miles an hour.⁴ At this period the gross receipts of the Irish post-office were £80,040; the charges of management and collection were £59,216, or at the rate of more than 70 per cent.; whilst in Scotland the receipts were £100,651, and the charges £16,896, or somewhat less than 17 per cent.⁵

In the American colonies postal improvements may be dated from Franklin the administration of Franklin, who was virtually the last colonial lin. postmaster-general, as well as unquestionably the best. In one shape or another he had forty years' experience of postal work, having been appointed postmaster at Philadelphia as early as October 1737. When he became postmaster-general in 1758 he bestirred himself for the improvement of his department in that practical painstaking way with which he was wont to guide any plough he had once put his hand to, whatever the ground it had to work in. He visited all the chief post-offices throughout Pennsylvania, New Jersey, New York, and New England, looking at everything with his own eyes. His administration cannot be better summed up than we find it to be in a sentence or two which he wrote soon after his dismissal. Up to the date of his appointment, he says, "the American post-office had never paid anything to that of Britain. We [*i.e.*, himself and his assistant] were to have £600 a year between us, if we could make that sum out of the profits of the office. . . . In the first four years the office became above £900 in debt to us. But it soon after began to repay us; and before I was displaced by a freak of the minister's, we had brought it to yield three times as much clear revenue to the crown as the post-office of Ireland. Since that imprudent transaction they have received from it—not one farthing."

The interval between the development of Palmer's improved methods (as far as that development was permitted by the authorities), which we take to be pretty nearly contemporaneous with the parliamentary settlement of his claims, and the still more important reforms introduced twenty-seven years later by Sir Rowland Hill, is chiefly marked by the growth of the packet system, under the influence of steam navigation, and by the elaborate investigations of the revenue commissioners of 1826 and the following years. Undoubtedly the inquiries of these commissioners attracted a larger share of public attention to the management of the post-office than had theretofore been bestowed on it; but, if anything had been wanted to throw into bolder relief Hill's intelligent and persevering exertions, these reports supply the want in ample measure. In some important particulars they mark out practical and most valuable reforms, but they are so clumsy in arrangement, so resilient in the treatment of the various branches of the service, and so crowded with petty details as to contrast most unfavourably with the lucid order and vigorous reasoning of Rowland Hill's *Post-*

Office Reform. While the functionaries of the post-office are criticized with a severity so salient as to wear an appearance at times of almost personal hostility, the truth that a very large and liberal increase of public facilities would be likely to benefit the revenue much more materially than small economies in salaries and perquisites seems scarcely to have dawned on the minds of the commissioners. Even in dealing with a new accommodation actually provided—that of the money-order office—whilst taking just exception to the unofficial character of its management, they incline rather to its abolition than to its reform.

Packet
services.

As early as 1788 the cost of the packets employed by the post-office attracted parliamentary attention. In that year the "commissioners of fees and gratuities" reported that in the preceding seventeen years the total cost of this branch had amounted to £1,038,133; and they naturally laid stress on the circumstance that many officers of the post-office were owners of such packets, even down to the chamber-keeper. At this time part of the packet service was performed by hired vessels, and part by vessels which were the property of the crown. The commissioners recommended that the latter should be sold, and the entire service be provided for by public and competitive tender. The subject was again inquired into by the Finance Committee of 1798, which reported that the recommendation of 1788 had not been fully acted upon, and expressed its concurrence in that recommendation. The plan was then to a considerable extent enforced. But the war rapidly increased the expenditure. The average (£61,000) of 1771-87 had increased in 1797 to £78,439, in 1810 to £105,000, in 1814 to £160,608. In the succeeding years of peace the expense fell to an average of about £85,000. As early as 1818 the "Rob Roy" plied regularly between Greenock and Belfast; but no use was made of steam navigation for the postal service until 1821, when the post-master-general established crown packets. The expenditure under the new system, from that date to 1829 inclusive, was thus reported by the commissioners of revenue inquiry in 1830.

TABLE III.—Cost of Packet Service, 1820-1829.¹

Year.		Year.	
1820 ²	£85,000	1825.....	£110,838
1821 ³	184,868	1826.....	144,592
1822.....	115,429	1827.....	169,250
1823.....	98,725	1828.....	117,280
1824.....	110,062	1829.....	108,505

The general administration of postal affairs at this period was still characterized by repeated advances in the letter rates, and the twenty years previous to Rowland Hill's reforms by a stationary revenue. The following table (IV.) will show the gross receipts, the charges of collection and management, and the nett revenue (omitting fractions of a pound) of the post-office of Great Britain. We give the figures for the year 1808 for the purpose of comparison.

Year.	Gross Income.	Charges of Collection, &c.	Charges per cent of Gross Income.	Nett Revenue.	Population of United Kingdom.
1808	£1,552,087	£451,481	29	£1,100,606	
1815-16	2,193,741	594,045	27	1,599,696	19,552,000
1818-19	2,209,212	719,622	32½	1,489,590	
1820-21	2,132,235	686,200	29	1,446,035	20,928,000
1824-25	2,255,239	655,914	29	1,599,325	22,362,000
1826-27	2,592,272	747,018	31	1,845,254	
1828-29	2,206,726	609,220	27½	1,597,516	25,605,000
1838-39	2,846,278	686,788	29	1,659,510	..

Governmental important feature in postal history,—the interference with correspondence for judicial or political purposes. We have already seen (1) that this assumption had no parliamentary sanction until the enactment of the 9th of Queen Anne; (2) that the enactment differed from the royal proclamations in directing a special warrant for each opening or detention of correspondence. It is a significant gloss on the statute to find that for nearly a century (namely, until 1798 inclusive) it was not the practice to record such warrants regularly in any official book.⁴ Of the use to which the power was applied the state trials afford some remarkable instances. At the trial of Bishop Atterbury, for example, in 1723 certain letters were offered in evidence which a clerk of the post-office deposed on oath "to be true copies from the originals, which were stopped at the post-office and copied, and sent forward as directed." Hereupon Atterbury very naturally asked this witness "if he had any express warrant under the hand of one of the principal secretaries of state for opening the said letters." But the Lords shelved his objection and put a stop to his inquiry on the grounds of public inexpediency.

² Last year of exclusive sailing packets.

³ First year of steam-packets.

⁴ *Report of Secret Committee on the Post-Office* (1844), p. 9.

Twenty-nine peers recorded their protest against this decision.⁵ But the practice thus sanctioned appears to have been pushed to such lengths as to elicit in April 1735 a strong protest and censure from the House of Commons. In the preceding February complaints were made by several members that not only were their letters charged at the post-office, but they were often broken open and perused by the clerks, that the practice of breaking open letters was become frequent, and was so publicly known that "the liberty given to break open letters . . . could now serve no purpose but to enable the idle clerks about that office to pry into the private affairs of every merchant and of every gentleman in the kingdom."⁶ A committee of inquiry was appointed, and after receiving its report the House resolved that it was "an high infringement of the privileges of the . . . Commons of Great Britain in Parliament for any postmaster, his deputies, or agents, in Great Britain or Ireland, to open or look into, by any means whatever, any letter directed to or signed by the proper hand of any member, without an express warrant in writing under the hand of one of the principal secretaries of state for every such opening and looking into; or to detain or delay any letter directed to, or signed with the name of any member, unless there shall be just reason to suspect some counterfeit of it, without an express warrant of a principal secretary of state for every such detaining or delaying."

Sir Rowland Hill's Reforms (1836-1842).

Rowland Hill's pamphlet (*Post-Office Reform*) of 1837 took for its starting-point the fact that, whereas the postal revenue showed for the past twenty years a positive though slight diminution, it ought to have showed an increase of £507,700 a year in order to have simply kept pace with the growth of population (see Table IV. above), and an increase of nearly four times that amount in order to have kept pace with the growth of the analogous though far less exorbitant duties imposed on stage-coaches. The stage-coach duties had produced in 1815 £217,671; in 1835 they produced £498,497. In 1837 there did not exist any precise account of the number of letters transmitted through the general post-office. Hill, however, was able to prepare a sufficiently approximate estimate from the data of the London district post, and from the sums collected for postage. He thus calculated the number of chargeable letters at about 88,600,000, that of franked letters at 7,400,000, and that of newspapers at 30,000,000, giving a gross total of about 126,000,000. At this period the total cost of management and distribution was £696,569. In the finance accounts of the year (1837) deductions are made from the gross revenue for letters "refused, missent, redirected," and the like, which amount to about £122,000. An analysis of the component parts of this expenditure assigned £426,517 to cost of primary distribution and £270,052 to cost of secondary distribution and miscellaneous charges. A further analysis of the primary distribution expenditure gave £282,308 as the probable outgoings for receipt and delivery and £144,209 as the probable outgoings for transit. In other words, the expenditure which hinged upon the *distance* the letters had to be conveyed was £144,000, and that which had nothing to do with distance was £282,000. Applying to these figures the estimated number of letters and newspapers (126,000,000) passing through the office, there resulted a probable average cost of $\frac{2}{100}$ of a penny for each, of which $\frac{28}{100}$ was cost of transit and $\frac{56}{100}$ cost of receipt, delivery, &c. Taking into account, however, the much greater weight of newspapers and franked letters as compared with chargeable letters, the apparent average cost of *transit* became, by this estimate, but about $\frac{3}{100}$, or less than $\frac{1}{10}$ of a penny.

A detailed estimate of the cost of conveying a letter from London to Edinburgh, founded upon the average weight of the Edinburgh mail, gave a still lower proportion, since it reduced the apparent cost of transit, on the average, to the thirty-sixth part of one penny. Hill in-

⁵ *Lords' Journals*, xxii. 183-186; *Howell's State Trials*, xvi. 540 sq.

⁶ *Parliamentary History*, ix. 842 sq.

ferred that, if the charge for postage were to be made proportionate to the whole expense incurred in the receipt, transit, and delivery of the letter, and in the collection of its postage, it must be made *uniformly* the same from every post-town to every other post-town in the United Kingdom, unless it could be shown how we are to collect so small a sum as the thirty-sixth part of a penny. And, inasmuch as it would take a ninefold weight to make the expense of transit amount to one farthing, he further inferred that, taxation apart, the charge ought to be precisely the same for every packet of moderate weight, without reference to the number of its enclosures.

At this period the rate of postage actually imposed (beyond the limits of the London district office) varied from 4d. to 1s. 8d. for a single letter, which was interpreted to mean a single piece of paper not exceeding an ounce in weight; a second piece of paper or any other enclosure, however small, constituted the packet a double letter. A single sheet of paper, if it at all exceeded an ounce in weight, was charged with fourfold postage. The average charge on inland general post letters was nearly 9d. for each. Apart from the necessary commercial evils of an excessive taxation, the effects upon the postal service itself were injurious,—on the one hand, a complicated system of accounts, involving both great waste of time and great temptation to fraud in their settlement, and, on the other, a constant invitation to the violation of the sacredness of correspondence, by making it part of daily official work to expose letters to a strong light expressly to ascertain their contents. These mischiefs it was proposed to remove by enacting that the charge for primary distribution,—that is to say, the postage on all letters received in a post-town, and delivered in the same or in any other post-town in the British Isles,—should be at the uniform rate of one penny for each half-ounce,—all letters and other papers, whether single or multiple, forming one packet, and not weighing more than half an ounce, being charged one penny, and heavier packets, to any convenient limit, being charged an additional penny for each additional half-ounce. And it was further proposed that stamped covers should be sold to the public at such a price as to include the postage, which would thus be collected in advance.¹ By the public generally, and pre-eminently by the trading public, the plan was received with great favour. By the functionaries of the post-office it was at once denounced as ruinous and ridiculed as visionary. Lord Lichfield, then postmaster-general, said in the House of Lords that, if the anticipated increase of letters should be realized, the mails would have to carry twelve times as much in weight, and therefore the charge for transmission, instead of being £100,000 as then, must increase to twelve times that amount. The walls of the post-office would burst; the whole area in which the building stood would not be large enough to receive the clerks and the letters.² The latter part of this prediction indeed has been abundantly verified, but not within the period or under the circumstances then referred to. In the course of the following year (1838) petitions were poured into the House of Commons. A select committee was appointed, which reported as follows:—

“The principal points which appear to your committee to have been established in evidence are the following:—(1) the exceedingly slow advance and occasionally retrograde movement of the post-office revenue during the . . . last twenty years; (2) the fact of the charge of postage exceeding the cost in a manifold proportion; (3) the fact of postage being evaded most extensively by all classes of society, and of correspondence being suppressed, more especially among the middle and working classes of the people, and this in consequence, as all the witnesses, including many of the post-office

authorities, think, of the excessively high scale of taxation; (4) the fact of very injurious effects resulting from this state of things to the commerce and industry of the country, and to the social habits and moral condition of the people; (5) the fact, as far as conclusions can be drawn from very imperfect data, that whenever on former occasions large reductions in the rates have been made, these reductions have been followed in short periods of time by an extension of correspondence proportionate to the contraction of the rates; (6) and, as matters of inference from fact and of opinion—(i.) that the only remedies for the evils above stated are a reduction of the rates, and the establishment of additional deliveries, and more frequent despatches of letters; (ii.) that owing to the rapid extension of railroads there is an urgent and daily-increasing necessity for making such changes; (iii.) that any moderate reduction in the rates would occasion loss to the revenue, without in any material degree diminishing the present amount of letters irregularly conveyed, or giving rise to the growth of new correspondence; (iv.) that the principle of a low uniform rate is just in itself, and, when combined with prepayment and collection by means of a stamp, would be exceedingly convenient and highly satisfactory to the public.”

During the session of parliament which followed the presentation of this report about 2000 petitions in favour of uniform penny postage were presented to both Houses, and at length the chancellor of the exchequer brought in a Bill to enable the treasury to carry that reform into effect. The measure was carried in the House of Commons by a majority of 100, and became law on 17th August 1839. A new but only temporary office under the treasury was created to enable Rowland Hill to superintend (al-^{of re-} though, as it proved, under very inadequate arrangements) forms. the working out of his plan. The first step taken was to reduce, on 5th December 1839, the London district postage to 1d. and the general inland postage to 4d. the half-ounce (existing lower rates being continued). On 10th January 1840 the uniform penny rate came into operation throughout the United Kingdom,—the scale of weight advancing from 1d. for each of the first two half-ounces, by gradations of 2d. for each additional ounce, or fraction of an ounce, up to 16 ounces. The postage was to be prepaid, and if not to be charged at double rates. Parliamentary franking was abolished. Postage stamps (see below, p. 585 sq.) were introduced in May following. The facilities of despatch were soon afterwards increased by the establishment of day mails.

But on the important point of simplification in the internal economy of the post-office, with the object of reducing its cost without diminishing its working power, very little was done. In carrying out the new measures the officers were, as the chancellor of the exchequer (Baring) expressed it on one occasion, “unwilling horses.” Nor need a word more be said in proof of the assertion than is contained in a naive passage of Colonel Maberly’s evidence before the postal committee of 1843. “My constant language to the heads of the departments was,—‘This plan, we know, will fail. It is your duty to take care that no obstruction is placed in the way of it by the heads of the department, and by the post-office. The allegation, I have not the least doubt, will be made at a subsequent period, that this plan has failed in consequence of the unwillingness of the Government to carry it into fair execution. It is our duty, as servants of the Government, to take care that no blame eventually shall fall on the Government through any unwillingness of ours to carry it into proper effect.’” And again: “*After the first week*, it was evident, from the number of letters being so much below Mr Hill’s anticipations, that it must fail, inasmuch as it wholly rested upon the number of letters; for without that you could not possibly collect the revenue anticipated.”

The plan, then, had to work in the face of rooted mistrust on the part of the workers. Its author was (for a term of two years, afterwards prolonged to three) the officer, not of the post-office, but of the treasury. He could only recommend measures the most indispensable through the chancellor of the exchequer; and, when Goulburn succeeded

Parliamentary action.

¹ *Post-Office Reform*, 27 sq.

² *Mirror of Parliament*, debate of 18th December 1837. But Lord Lichfield was an excellent public servant, and many reforms were made by him.

Results.

Baring, the chancellor was very much of Colonel Maberly's way of thinking. It happened, too, that the scheme had to be tried and carried through at a period of severe commercial depression. Nevertheless, the results actually attained in the first two years were briefly these:—(1) the chargeable letters delivered in the United Kingdom, exclusive of that part of the Government correspondence which theretofore passed free, had already increased from the rate of about 75,000,000 a year to that of 196,500,000; (2) the London district post letters had increased from about 13,000,000 to 23,000,000, or nearly in the ratio of the reduction of the rates; (3) the illicit conveyance of letters was substantially suppressed; (4) the gross revenue, exclusive of repayments, yielded about a million and a half per annum, which was about 63 per cent. of the amount of the gross revenue in 1839. These results at so early a stage, and in the face of so many obstructions, amply vindicated the policy of the new system. But by its enemies that system was loudly declared to be a failure, until the progressive and striking evidence of year after year silenced opposition by an exhaustive process.

Seven years later (1849) the 196,500,000 letters delivered throughout the United Kingdom in 1842 had increased to nearly 329,000,000. In addition, the following administrative improvements had been effected:—(1) the time for posting letters at the London receiving-houses extended; (2) the limitation of weight abolished; (3) an additional daily despatch to London from the neighbouring (as yet independent) villages; (4) the postal arrangements of 120 of the largest cities and great towns revised; (5) unlimited writing on inland newspapers authorized on payment of an additional penny; (6) a summary process established for recovery of postage from the senders of unpaid letters when refused; (7) a book-post established; (8) registration reduced from one shilling to sixpence; (9) a third mail daily put on the railway (without additional charge) from the towns of the north-western district to London, and day-mails extended within a radius of 20 miles round the metropolis; (10) a service of parliamentary returns, for private Bills, provided for; (11) measures taken, against many obstacles, for the complete consolidation of the two heretofore distinct corps of letter-carriers,—an improvement (on the whole) of detail, which led to other improvements thereafter.¹

Improvements, more conspicuous still, in the money-order branch of the postal service will be noticed in a subsequent section of this article (page 572).

Later History (1842-1885).

When Sir R. Hill initiated his great reform the post-mastership-general was in the hands of the earl of Lichfield, the thirty-first in succession to that office after Sir Brian Tuke. It was under Lord Lichfield that the legislation of 1839 was carried out in 1840 and in 1841. In September of the last-named year Lord Lichfield was succeeded by Viscount Lowther.

Opening and detention of letters.

In the summer of 1844 public attention was aroused in a remarkable manner to a branch of post-office administration which hitherto had been kept almost wholly out of sight. The statement that the letters of Mazzini, then a political refugee, who had long been resident in England, had been systematically opened, and their contents communicated to foreign Governments, by Sir James Graham, secretary of state for the home department, aroused much indignation. The arrest of the brothers Bandiera,² largely

in consequence of information derived from their correspondence with Mazzini, and their subsequent execution at Cosenza made a thorough investigation into the circumstances a public necessity. The consequent parliamentary inquiry of August 1844, after retracing the earlier events connected with the exercise of the discretionary power of inspection which parliament had vested in the secretaries of state in 1710, elicited the fact that in 1806 Lord Spencer, then secretary for the home department, introduced for the first time the practice of recording in an official book all warrants issued for the detention and opening of letters, and also the additional fact that from the year 1822 onwards the warrants themselves had been preserved. The whole number of such warrants issued from 1806 to the middle of 1844 inclusive was stated to be 323, of which no less than 53 had been issued in the years 1841-44 inclusive, a number exceeding that of any previous period of like extent. It further appeared that the whole recorded number of warrants from the beginning of the century was 372, which the committee classified under the following heads:—

Subject-Matters in relation to which Warrants were issued for the Opening of Letters, 1799-1844.

Bank of England	13	Letters returned	7
Bankruptcy	2	Address copied	1
Murder, theft, fraud, &c.	144	Forged frank	1
Treason, sedition, &c.	77	Uncertain	89
Prisoners of war	15		
Revenue	5	Total	372
Foreign correspondence	20		

The committee of 1844 proceeded to report that "the warrants issued during the present century may be divided into two classes,—1st, those issued in furtherance of criminal justice, . . . 2d, those issued for the purpose of discovering the designs of persons known or suspected to be engaged in proceedings dangerous to the State, or (as in Mazzini's case) *deeply involving British interests*, and carried on in the United Kingdom, or in British possessions beyond the seas. . . . Warrants of the second description originate with the home office. The principal secretary of state, of his own discretion, determines when to issue them, and gives instructions accordingly to the under-secretary, whose office is then purely ministerial. The mode of preparing them, and keeping record of them in a private book, is the same as in the case of criminal warrants. *There is no record kept of the grounds on which they are issued*, except so far as correspondence preserved at the home office may lead to infer them." . . . The letters which have been detained and opened are, unless retained by special order, as sometimes happens in criminal cases, closed and resealed, without affixing any mark to indicate that they have been so detained and opened, and are forwarded by post according to their respective super-descriptions."³

Almost forty years later a like question was again raised in the House of Commons (March 1882) by some Irish members, in relation to an alleged examination of correspondence at Dublin for political reasons. Sir William Harcourt on that occasion spoke thus: "This power is with the secretary of state in England. . . . In Ireland it belongs to the Irish Government. . . . It is a power which is given for purposes of state, and the very essence of the power is that no account [of its exercise] can be rendered. To render an account would be to defeat the very object for which the power was granted. If the minister is not fit to exercise the power so entrusted, upon the responsibility cast upon him, he is not fit to occupy the post of secretary of state."⁴ The House of Commons accepted this explanation; and in view of many recent and grave incidents, both in Ireland and in America, it would be hard to justify any other conclusion.

The increase in the number of postal deliveries and in Increase that of the receiving-houses and branch-offices, together in postal business (1839-57). with the numerous improvements introduced into the working economy of the post-office, when Rowland Hill at length obtained the means of fully carrying out his reforms by his appointment as secretary, speedily gave a more vigorous impulse to the progress of the nett revenue than had theretofore obtained. During the seven years 1845-51 inclusive the average was but £810,951. During the seven years 1852-57 inclusive the average was £1,166,448,—the average of the gross income during the same septennial period having been £2,681,835. The following table (V.) shows the details (omitting fractions of a pound) for the entire period from 1838, the last complete year of the old rates of postage, to 1857 inclusive:—

¹ Hill, *History of Penny Postage* (1880), Appendix A (*Life*, &c., ii. 438). Part of the strenuousness of the opposition to this measure arose, it must be owned, from the "high-handedness" which in Sir R. Hill's character somewhat marred very noble faculties. The change worked much harm to some humble but hardworking and meritorious functionaries.

Briefly, within a period of eighteen years under the penny rate the number of letters became more than sixfold what it was under the exorbitant rates of 1838. When the change was first made the increase of letters was in the ratio of 122·25 per cent. during the year. The second year showed an increase on the first of about 16 per cent. During the next fifteen years the average increase was at the rate of about 6 per cent. per annum. Although this enormous increase of business, coupled with the increasing preponderance of railway mail conveyance (invaluable, but costly), carried up the post-office expenditure from £757,000 to £1,720,800, yet the nett revenue of 1857 was within £320,000 of the nett revenue of 1839. During the year 1857 the number of newspapers delivered in the United Kingdom was about 71,000,000, and that of book-packets (the cheap carriage of which is one of the most serviceable and praiseworthy of modern postal improvements) about 6,000,000.

Growth
and
changes
(1838-
85).

During the succeeding quarter of a century, 1858-84, the achievements of the period 1835-57 have been eminently surpassed. The postmasters-general of the new epoch have been assisted and seconded by a series of public servants, not a few of whom added to the conspicuous energies of Sir R. Hill more of those not less estimable qualities—suavity of manner, tact in dealing with large bodies of inferiors, reverence for the good doings of past times—than had fallen to his lot. Salient amongst such stand the names of Sir John Tilley, Mr Frank Ives Scudamore, and Mr Stevenson Blackwood. Among the postmasters-general the Earl of Elgin (1859), Lord Stanley of Alderley (1860), Lord Hartington (December 1868), Lord John Manners (February 1874), and the forty-fourth postmaster-general Henry Fawcett¹ (April 1880 to November 1884) hold eminent place.

This period includes—(1) the establishment of postal savings banks (1861), in which Mr Gladstone, as chancellor of the ex-

¹ The Right Hon. Henry Fawcett (1838-1884), under whose exceptionally vigorous, able, and statesmanlike administration many improvements of the postal system were introduced, was born at Salisbury in 1833. He was educated at King's College, London, and Trinity Hall, Cambridge, and after graduating in 1856 as seventh wrangler began his studies for the English bar. A weakness in the eyes had occasionally interrupted his studies before the great calamity which befell him while out shooting in September 1858, when a gun accident totally deprived him of sight. The exceptional interest of his career lies in its complete fulfilment of his resolution that he would not allow the calamity "to interfere with his discharge of duty or the enjoyment of life." Even as regards physical exercise his resolution was practically fulfilled, for he continued to engage in riding, fishing, skating, swimming, and rowing with as keen enjoyment as before. As regards the chief interests of his life the result of the accident was probably beneficial rather than otherwise. Returning to Cambridge, he devoted himself to the systematic study of political economy, and in 1863 he was chosen professor of that subject. In 1867 he was married to Millicent, daughter of Mr Newson Garrett of Aldeburgh, Suffolk, who assisted him in the preparation of several of his works on political economy, and also wrote independently on the same subject. The best known of Mr Fawcett's treatises is his *Manual of Political Economy* (1863). In this science he followed substantially the old lines, but a certain freshness attaches to his views from his deep practical interest in the welfare of the working-classes. After several attempts to enter parliament, he was in 1865 chosen for Brighton, which he represented till 1874. Shortly after losing his seat for that borough he was returned for Hackney. On the accession of Mr Gladstone to office in 1880 he was made postmaster-general, and a member of the privy council. He died from pleurisy, after a few days' illness, 7th November 1884.

chequer, had a very large share, and (2) the transfer to the state of the telegraphic service (1870). The origin and growth of each of these pregnant improvements is narrated in a separate section of this article. Scarcely less important than these are (3) the introduction of postal cards (October 1870) and (4) the establishment (August 1883) of a parcel post. The last-named measure will probably, in its results, prove to be a public boon of almost unexampled magnitude. At its outset it checks railway abuses, both of overcharge and of excessive delays, which had grown to be enormous evils. Minor but most valuable ameliorations of the postal service begin with the abolition of the half-ounce limit (1877), and include the provision of new and excellent post-office buildings, great improvement of the system of registration, extensive accelerations of mails in various parts of the empire, increased postal deliveries, and, not least in importance, a most just amelioration (greatly needed) of the position of sub-postmasters, of clerks, of sorters, and of letter-carriers. Certain minor improvements cannot be more briefly or better epitomized than in the words of a writer in the *Standard* newspaper of 10th January 1879.

"The half-ounce weights chanced to be just above the weight of a letter written on full-sized post paper, and, when that was the maximum weight allowed, the margin was so fine that a little thicker paper than usual, or slightly larger envelope, sufficed to turn the scale, and all but strictly business correspondents were continually landing those whom they favoured with their communications in the annoyance of a surcharge for deficient prepayment of postage. By the extension to an ounce all that worry and annoyance has been swept away, and no inconsiderable benefit has been conferred besides on people whose missives are of necessity somewhat more ponderous than ordinary. Quite recently the post-office has introduced another great improvement, which the public, not having yet had time to appreciate, do not utilize to the extent it deserves,—that is, the system of ensuring, which is little less than absolute security for money and articles of value sent through the post by means of registration. The fee for a registered letter, which was at one time as much as half a crown, and has within easy recollection been as high as a shilling, was reduced early in 1878 from 4d. to 2d., with the result that something like 6,500,000 of registered letters were sent in 1878, as compared with 4,316,000 in the previous year, and with 1,300,000 twenty years ago. This number would be largely increased if all the official registered packets were included. Not only has the fee been reduced to what may be considered the lowest possible point, but letters are registered by rural postmen on their rounds, and registration envelopes have been issued by the department to facilitate registration by the public. The envelopes have been devised with care, and seem well suited for the purpose, being strong as well as cheap. They are sold at prices varying from 2½d. to 3d. each (which includes the registration fee), and are in five useful sizes, from small note size to a large cover suitable for bankers and merchants. But the reduction in the charge and the sale of envelopes are not the only improvements which have been made in the registration system, for the post-office now undertakes to make good, up to £2, the value of any registered letter which it loses, simply stipulating, in the case of money, that one of its own envelopes shall be used. It is on every account most desirable that money and articles of value should not be loosely committed to the post, and with the facilities for transmitting letters securely which are now offered, people who choose to run the risk of loss deserve very little sympathy if the chance goes against them. As regards international communication it is enough to merely mention the beneficent results of the postal union, under which the postage to most places on the Continent and abroad has been reduced to the uniform rate of 2½d. for a letter not exceeding half an ounce in weight; while to a second category of more distant places under foreign dominion the charge for the letter of half an ounce is 6d."

Table VI. gives the estimate of the number of letters (only) which passed in both directions between the United Kingdom and foreign countries and colonies in 1864.

France	6,771,000	West Indies, Pacific, and	
Canada, British North		Brazil	1,727,000
America, and United		Belgium	924,000
States	4,865,000	Italy	827,000
Prussia, Hamburg, and		Spain	617,000
Bremen	4,408,000	Holland	600,000
East Indies, China, &c.	3,882,000		
Australia	2,916,000	Total	27,281,000

There were also about 21,500,000 books, papers, and patterns.

Meanwhile the estimated number of chargeable letters delivered latest within the United Kingdom during the year had grown from statistics 504,421,000, at which it stood in 1857, to upwards of 700,000,000 (1885). In 1867, and to 1,057,732,000 in 1877. In the year 1884 the number was reported² as 1,322,086,900 (exclusive of 153,586,100 post-cards). The growth of other departments of the postal service is fully in proportion to that of the letters of inland delivery, as may be seen by the following tables (VII., VIII., IX.).

² *Thirtieth Report of the Postmaster-General, 1884*, p. 1; cp. *Statistical Abstract of United Kingdom* (1884), p. 157.

West Indies (British) ..	266,600	109,200	355,700	597,800	1,328,200

Meanwhile the position of many efficient workers in the postal service, who had helped to bring about these satisfactory results, stood greatly in need of improvement. The humbler class of clerks, most of the sorters, and the entire body of metropolitan letter-carriers were prominent in expressing discontent, and they were able to show good grounds for it. The telegraphists soon followed with like representations, though their hardships were assuredly less. The result has been a large measure of amelioration in pay and in position, effected in part by Lord John Manners, and more especially by Mr Fawcett, who in 1883 estimated that these improvements would involve an annual cost of about £63,000.

The systematic employment of women in Her Majesty's postal and telegraph service was for a long time an experiment and a problem. It may now be said, most accurately, that, on the whole, the experiment is grandly successful, and the problem fully solved. In telegraphic labour female counter-clerks and telegraphists were actively employed before the transfer to the state. The postmaster-general of 1870 (Lord Hartington) did but accept what he found established. Under the new regulation, he employed women as telegraphists for eight hours daily, at scales of pay which varied from eight shillings a week to thirty, according to age, intelligence, and practical experience of the work. At first the women were put into separate galleries, afterwards into the same galleries with men and boys; and the change was found to work advantageously for all. As regards the postal service proper, the *general* introduction thereof to female labour was effected, under the rule of Lord John Manners, by Sir John Tilley. The situations were eagerly sought for. At the close of 1880 there were in the three capital cities of London, Edinburgh, and Dublin alone very nearly a thousand female telegraphists; and throughout the kingdom a number not much inferior of women of various grades, employed in minor postal services, over and above the number of those whose employment is but an incident of their family position, as the wives and daughters of sub-postmasters and the like. The best and the most entirely successful experiment of all was that of 1875, which offered postal clerkships expressly to "gentlewomen," and conspicuously to the daughters of officers of the army and navy and of officials in the civil service, admissible only between seventeen and twenty years of age after six months' satisfactory probation, and organized in 1876 into two classes, each under a lady superior, who holds the position of a staff-officer. All promotions are made according to merit. Those of class I. have £80 to £100, and the "principal female clerks £100 to £150 a year; class II. £40 to £75. The same work which formerly occupied male clerks at £80 to £240 is now equally well done by female clerks at £40 to £75, and so in proportion with the other classes."⁴

Subjoined are (1) the latest financial statement of postal *expenditure* for the year 1883-84, and (2) some comparisons of the nett revenue of the post-office at various periods.

United Kingdom.—Expenditure for year ending 1st March 1884.

Post-office services, postal savings banks, annuities branch, &c.	£4,507,500
Mail-packet service	721,100
Telegraph service	1,707,000

Grand total	<u>£6,935,600</u>
-------------------	-------------------

In 1643 the nett revenue was about £5000 a year. In 1653 it was farmed to John Manley for £10,000 a year, and ten years afterwards to Daniel O'Neill for £21,500. In 1677 the farm rent was raised to £43,000. In 1685 the nett revenue had grown to £65,000, in 1707 to £111,426, in 1790 to £331,180, in 1800 to £720,982. In 1808 the nett revenue (for Great Britain) was £2,100,606, in 1820-21 £1,495,945, in 1839 £1,659,510, in 1849

³ *Ibid.*, pp. 16, 17.

⁴ *Quarterly Review*, 1881, vol. cli. p. 187—an article by Lady John Manners.

£740,429, in 1859 £1,349,676, in 1869 £2,198,220,¹ in 1881 £2,597,768, in 1882 (inclusive of telegraphs) £3,100,475, in 1883 £3,061,748, and in 1884 £2,897,427.²

Money-Order Department.

Money
orders.

The money-order branch of the post-office was for forty years the private enterprise of three post-office clerks known as "Stow and Company." It was commenced in 1792, with the special object of facilitating the safe conveyance of small sums to soldiers and sailors, but was soon extended to all classes of small remitters. The postmaster-general sanctioned the scheme without interposing in the management. Each of the three partners advanced £1000 to carry it on; and each of them seems, during the greater portion of the period, to have derived about £200 a year in profit. In 1830 the amount of remittances from London was only about £10,000. The percentage was eightpence in the pound, out of which threepence were allotted to each of the postmasters receiving and paying, the remaining twopence forming the profit of the partners. On 6th December 1838 the office was converted into an official department under the postmaster-general,—the then partners receiving due compensation. The commission was reduced to a fixed charge of 1s. 6d. for sums exceeding £2 and under £5, and of 6d. for all sums not exceeding £2. In 1840 these rates were reduced to 6d. and 3d. respectively. The number and aggregate amount of the orders issued (inland, colonial, and foreign) in different periods from the reorganization (1839) until 1884 are as follows (Table X.) :—

Years.	Number.	Amount.
1839	188,921	£813,124
1844	2,806,803	5,695,395
1849	4,248,891	8,152,643
1854	5,466,244	10,462,411
1861-65 (average)	8,055,227	16,624,503
1866-70	9,720,030	19,847,258
1875	16,819,874	27,688,255
1876 ³ (first three months only)	4,436,858	7,194,943
1878-79	17,740,622	27,303,093
1879-80	17,807,573	26,371,020
1880-81	16,935,005	26,003,582
1881-82 ⁴	15,383,033	25,393,574
1882-83	15,090,858	27,597,883
1883-84	14,663,635	27,629,879

Postal
notes.

From 1871 to the end of 1877, the rates having been reduced to 1d. for sums under 10s., and 2d. for sums of 10s. and under 20s., increasing by a graduated scale of 1d. for each additional £1 or fraction thereof, inland orders failed to be remunerative; and it was only by reckoning as profit the amount of unclaimed and forfeited orders that the cost to the office of inland orders could be covered. But, as the loss was only on orders for very small sums, Mr Chetwynd proposed to meet it by issuing postal notes payable at any post-office without previous notice. When the plan was submitted to a committee appointed by the treasury, it was objected that the postal note as a remitting medium would be less secure than the money order. The objection was met in part by giving a discretionary power to fill in the name of the post-office and also that of the payee, and no practical inconvenience or cause of complaint seems to have resulted. And in like manner another

¹ Average of five years, and exclusive of telegraphs.

² In the *Thirtieth Report of the Postmaster-General* (1884) the amount is stated as £2,687,100. The statement in the text is from the *Analysed Account of the Public Income and Expenditure*, presented to parliament by the treasury in July 1884, and is unquestionably the correct one. The comparative deficiency as compared with 1883 is due to the expenditure of £350,000 for plant in the telegraphs and parcel-post departments.

³ From 1877 onwards the official accounts are made up to 31st March in each year.

⁴ The figures for this year are those given in the general tabular recapitulation of the appendix to the *Twenty-eighth Report of Postmaster-General*, 1882, p. 40. In the body of the same report (p. 8) they are stated at 14,880,821 and £23,848,936 respectively. The tabular figures are those also of the *Twenty-ninth Report*, 1883, and of the *Thirtieth Report*, 1884.

objection which was urged against the new form of money order in several quarters, and very strongly in the *Banker's Magazine*—namely, that they would prove to be an issue of Government small notes under another name—has derived no support from experience. "It is found," says the postmaster-general, "that the average time [during] which these orders are in circulation is six days,—a fact which shows that there was no foundation for the idea that they would be used as currency."⁵ The statistics of notes issued under the provisions of the Postal Orders Act, 43 and 44 Vict. c. 33 (1880), are as follows (Table XI.) :—

	Number.	Value.
1881 (quarter ending 31st March)	646,989	£292,150
1881-82	4,462,920	2,006,918
1882-83	7,980,328	3,451,284
1883-84	12,286,556	5,028,663
Total	25,376,793	£10,779,015

The postal notes most largely in request are those of 1s., 5s., 10s., and 20s. In 1884 plans were under the postmaster-general's consideration for improving the regulations and for extending the system to the colonies. Meanwhile the money-order business, which for several years past had been constantly declining both in number and in value, was on the increase. In foreign⁶ and in colonial orders the increase was in the number as well as in the amount. The inland orders showed an increase in value of nearly two millions sterling (£1,856,091) in 1882-83 as compared with 1881-82, although their number was smaller by 386,531. In 1883-84 there was a decrease of 0.84 per cent. in the value as compared with that of 1882-83, whilst the increase in the number of postal orders during the same year was more than four millions, the increase in value being more than £1,500,000.

The relative amount of the money-order business of the chief towns of the United Kingdom is shown in Table XII.⁷ It states the number and amount of the orders paid in each town on one day only (5th May 1876), and for the sake of comparison the corresponding figures for one day in 1884 (5th May) are appended :—

5th May 1876.		Total of Orders paid.		Paid through Bankers.	
		Num-ber.	Amount.	Num-ber.	Amount.
London (general post-office)		8778	£14,802	8339	£14,073

Postal Savings Banks.

The establishment of post-office savings banks was practically suggested in the year 1860 by Mr Charles William Sykes of Huddersfield, whose suggestion was cordially received by Mr Gladstone, then chancellor of the exchequer, to whose conspicuous exertions in parliament the effectual working-out of the measure and also many and great improvements in its details are substantially and unquestionably due. Half a century earlier (1807) it had been proposed to utilize the then existing (and very rudimentary) money-order branch of the post-office for the collection and

⁵ *Twenty-eighth Report of Postmaster-General*, 1882, p. 8.

⁶ The rate of commission on foreign money orders was reduced on 1st January 1883 by one-third. To all countries within the Postal Union (see *infra*, p. 583 sq.) it is now 6d. for sums not exceeding £2; 1s. for £5; 1s. 6d. for £7; 2s. for £10.

⁷ Fractions of £1 are omitted.

⁸ The figures for 7th May are given, as the 5th was a partial holiday in Edinburgh.

transmission of savings from all parts of the country to a central savings bank to be established in London. A Bill to that effect was brought into the House of Commons by Mr Whitbread, but it failed to receive adequate support, and was withdrawn. When Mr Sykes revived the proposal of 1807 the number of savings banks managed by trustees was 638, but of these about 350 were open only for a few hours on a single day of the week. Only twenty throughout the kingdom were open daily. Twenty-four towns containing upwards of ten thousand inhabitants each were without any savings bank. Fourteen entire counties were without any. In the existing banks the average amount of a deposit was £4, 6s. 5d.

Mr Gladstone's Bill—entitled "An Act to grant additional facilities for depositing small savings at interest, with the security of Government for the due repayment thereof"—received the royal assent on the 17th of May 1861, and was brought into operation on the 16th of September following. The banks first opened were situated in places theretofore unprovided. In February 1862 the Act was brought into operation both in Scotland and in Ireland. Within two years nearly all the money-order offices of the United Kingdom became savings banks; about 367,000 new deposit accounts were opened, representing an aggregate payment of £4,702,000, including a sum of more than £500,000 transferred from trustee savings banks the accounts of which were closed. At the end of 1863 the number of accounts in the post-office banks was 319,669, with an aggregate deposit of £3,377,480. The average amount of each deposit was £3, 2s. 11d. In 1867 the number of post-office savings banks in the United Kingdom was 3629, that of depositors in them 854,983, the amount standing to their credit £9,749,929. The average amount of each deposit was about £2, 18s. At the end of 1878 there were in the United Kingdom 5831 post-office savings banks; the number of depositors was 1,892,756; and the amount standing to their credit, inclusive of interest, was £30,411,563. At the end of 1882 the number of banks was 6999, the number of depositors 2,858,976, and the amount standing to their credit £39,037,821. This sum was increased at the end of the ordinary financial year, 31st March 1883 (the savings banks accounts being made up, in conformity with the Act of 1861, to 31st December), to £40,087,000. The average amount of each deposit was about £2, as against £4, 6s. 5d. in the trustee savings banks prior to the passing of the Act of 1861.

On 31st December 1883 the number of depositors was 3,105,642, and the aggregate amount standing to their credit (including interest) was £41,768,808; the amount of expenses remaining unpaid was about £11,000. The aggregate value of securities and amount of cash in the hands of the national debt commissioners was £43,294,949. The amount of cash in the hands of Her Majesty's postmaster-general was £316,853. The aggregate assets were £43,697,932. The surplus of assets over liabilities was £1,918,116. At the beginning of 1884 the total amount received from depositors, including interest, stood at £173,660,388, the total amount repaid to depositors at £131,891,580. The aggregate number of deposits from the outset of postal savings banks was 62,154,832, that of withdrawals 21,612,727, the number of accounts opened 9,225,575, that of accounts closed 6,119,933, that of accounts remaining open 3,105,642. The total cost of these banks was £2,698,547. The aggregate number of transactions of all kinds was 83,767,559. The average cost of each transaction was 7 $\frac{7}{10}$ d. It marks the accuracy of the Government actuaries to note that, prior to the passing of the Savings Banks Act of 1861, the estimated cost of each transaction thereunder was stated at 7d.

Any depositor in the post-office savings bank can invest his deposit in Government stock by making proper application to the controller of the savings bank department, London, provided that the sum be not less than £10, or than the amount of the current price of £10 stock together with the commission, whichever sum is the smaller; not more than £100 stock can be credited to an account in any year ending 31st December, or £300 stock in all. Within seven days from the receipt of the application the depositor's account is charged with the current price of the stock purchased, with the commission, the depositor receiving an investment certificate as evidence of the transfer.

As to investments in stock, the postmaster-general reports in 1884 that the total amount of Government stock on 31st December 1883 standing to the credit of depositors was £1,519,983 held by 20,767 persons, against £1,143,717 held by 16,609 persons in 1882,—an increase of £376,266 in amount and of 4158 in the number of stockholders. The average amount of stock held by each person at the end of the year was £73, 3s. 10d., as compared with £68, 17s. 3d. in 1882. During the seven years 1877 to 1883, inclusive, the average sum annually paid into the exchequer (under § 14 of the Act above named) as the excess of accruing interest was £127,192.

The apportionment of the outstanding accounts and their relation in each part of the United Kingdom to the population, respectively, stood as follows at the close of each of the years 1881, 1882, and 1883¹:—

TABLE XIII.—*Number and Amount of Open Accounts in Post-Office Savings Banks.*

	Year 1881.		Year 1882.	
	No.	Amount. ²	No.	Amount. ²
England	2,318,113	£82,670,307	2,643,785	£39,037,821

	Year 1883.			
	No.	Amount with Interest.	Proportion to Population.	Average of each Deposit.
England, Wales, and adjacent isles	2,874,458	£41,768,808	{ 1 to 9	£13 10 6
Scotland	116,208		{ 1 to 33	7 5 3
Ireland	114,976		{ 1 to 44	17 16 11
Total	3,105,642			

During the year 1883 nearly two millions and three quarters sterling (£2,730,987) of postal savings bank deposits were made in excess of those of the year 1882. Only seven small trustee savings banks were closed during the year 1883. During that year 323 new postal savings banks were opened in England and Wales, 33 in Scotland, and 14 in Ireland. At the close of the year the total number for the United Kingdom was 7369. On 31st March 1884 that number was increased to 7475. The year 1874 counts among the flourishing years of trade, 1884 among the depressed years. But since 1874 the aggregate amount of savings deposits in postal banks has very nearly doubled without any noticeable diminution in the business transacted by the trustee savings banks, and the number of depositors has also nearly doubled.

In England the county of Middlesex ranks first with 512,229 depositors (1881) and an aggregate deposit of £7,146,375; in Wales, Glamorganshire with 32,573 depositors and £371,419; in Scotland, Lanarkshire with 14,763 depositors and £104,550; in Ireland, Dublin county with 26,480 depositors and £367,672. At the close of 1882 the aggregate sum due to depositors in the last-named county had increased to £393,994. The increase of late years in the Irish deposits is, it may be added, very conspicuous,

¹ The figures of 1881 are from a return dated 10th August 1882 (Commons' Session Papers, 1882, No. 347). The figures of 1882 are from *Twenty-ninth Report of the Postmaster-General*, 1883; those of 1883 from the *Thirtieth Report*, 1884.

² Including fractions of £1, omitted in the particulars above.

and extends to every county of the kingdom. The aggregate sum due to depositors throughout Ireland in 1873 was £845,550; in 1878 it was £1,325,806, and in 1882 £1,925,460, in addition to £125,000 of Government stock standing to the credit of depositors, or, in the whole, £2,050,460.

Of the 638 trustee savings banks which existed in the United Kingdom at the date of the establishment of the post-office system 230 have been closed. Fifteen new trustee banks have been opened; so that the number now existing is 423, as compared with 7475 post-office savings banks.

Under the Act 45 and 46 Vict. c. 51 (1882) the postmaster-general will insure the lives of persons of either sex between the ages of fourteen and sixty-five, inclusive, for any sum not less than £5 or more than £100; but where the amount does not exceed £5 the earlier limit of age is eight years. An annuity, immediate or deferred, for any sum not less than £1 or not more than £100 will be granted by the postmaster-general, under the same Act, to any

person not under five years of age. The transactions take place through the medium of the savings bank departments. Husband and wife may each purchase an annuity up to the maximum amount, and each may be insured up to the full amount of £100. Conditions of contract in the case of annuities depend upon the age and sex of the purchaser, together with, where the annuity is deferred, the number of years which are to elapse before the commencement of the annuity; they also vary according as the purchase money is to be returned or not. The premiums charged for insurances vary with the age of the insurer and the mode in which the insurance is effected. The insurer, if not under sixteen years of age, enjoys the right of nominating the person to whom the money due at his or her death is to be paid. The contracts for annuities and life insurances in connexion with the savings bank branch of the post-office began on 17th April 1865. The following table (XIV.) shows the amount of business done in different periods down to the year 1883:—

Year.	ANNUITIES.											LIFE INSURANCES.

Postal Telegraphs.

Early proposals.

To the chamber of commerce of Edinburgh belongs the honour of effectually originating that public demand for the transfer of the telegraphic service of the United Kingdom from commercial companies to the state which led to the passing of the Acts of Parliament of 1868 and 1869. There had, indeed, been several like proposals by individuals in preceding years. Mr Thomas Allan proposed such a transfer in 1854. Two years later the scheme was advocated by Mr Baines of the general post-office, and afterwards by Mr Ricardo. But these proposals had no practical effect until after the action taken at Edinburgh, mainly at the instance of Mr (now Sir) George Harrison, convener of the chamber. The committee of inquiry then appointed showed conclusively that the telegraphic service, as managed by the companies, (1) maintained excessive charges, (2) occasioned frequent and vexatious delays in the transmission of messages, and inaccuracies in the rendering of them, (3) left a large number of important towns and districts wholly unprovided for, and (4) placed special difficulties in the way of that newspaper press which had, in the interest of the public, a claim so just and so obvious to special facilities. The committee also proved that, great as were the just causes of public complaint at the date of its inquiry, they would have been greater still but for a considerable reduction of charge effected by, and in consequence of, the establishment in 1861 of the United Kingdom Company,—a company opposed by a formidable combination of its competitors, which forced it to abandon the uniform shilling rate, irrespective of distance, with which it started.⁴ The Edinburgh chamber was unanimous in supporting the plan of a uniform sixpenny rate, and that proposal was speedily

endorsed by the other chambers of commerce throughout the kingdom. When the inquiry of 1865 was instituted the total number of places supplied with telegraphic communication by all the companies collectively was about 1000, whereas the number of places having postal communication at the same date was 10,685. The telegraph offices were placed most inconveniently for the service of the population generally, and especially for that of the suburbs of large towns; and under the then existing telegraphic tariff the charge in Great Britain was a shilling for a twenty-word message over distances not exceeding 100 miles; 1s. 6d. for a like message over distances from 100 to 200 miles; 2s. when exceeding 200 miles. For a message between Great Britain and Ireland the charge ranged from 3s. to 6s.; to Jersey or Guernsey it was 7s. 8d. There were also innumerable extra charges, under contingent regulations of great complexity, which commonly added 50 per cent. to the primary charge, and frequently doubled it.

The Edinburgh committee considered in turn the respective merits of three several remedial measures: (1) a regulated amalgamation of the existing companies; (2) the establishment of entire free-trade in public telegraphy; (3) the transfer of the service to the post-office. It tended towards a preference of the last, but agreed to recommend the appointment of a royal commission of inquiry prior to legislation. In the result the needful preliminary inquiries, and also the preparation of the Bills for parliament to which those inquiries led, came to be made by the direct authority of the postmaster-general, and were mainly entrusted to Mr Frank Ives Scudamore, second secretary of the post-office.

The Electric Telegraph Act of 1868 (31 and 32 Vict. c. 110) authorized the postmaster-general, with consent of the treasury, to purchase for the purposes of the Act the whole, or such parts as he should think fit, of any existing telegraphic company, "provided always that no such purchase be made . . . until the proposed agreement, and a treasury minute thereupon, shall have lain for one month upon the table of both Houses of Parliament without disapproval." The Bill in its original form gave to the

¹ Prior to the year 1875 the payments consisted of purchase money returned only, no annuities being payable till after the lapse of ten years.

² On immediate and deferred annuity contracts, the charges on monthly allowances being included in the premium.

³ Claims on surrender value of life insurance contracts commenced in this year.

⁴ *Papers on Electric Telegraphs*, 1868, pp. 53, 55, 202 sq.

post-office the exclusive right of public telegraphy. But the committee of the House of Commons to which the Bill was referred made a special report of their opinion "that it is not desirable that the transmission of messages for the public should become a legal monopoly in the post-office." They also recommended that it should be left to the discretion of the postmaster-general, with the consent of the treasury, to make special agreements for the transmission of certain classes of messages at reduced rates; that security should be taken for ensuring the secrecy of messages, by making its violation punishable as a misdemeanour; and, finally, that submarine cables acquired by the postmaster-general should at first be leased to companies, although ultimately it might become expedient that the post-office should work them.¹ The Act of 1869 (32 and 33 Vict. c. 73), entitled "An Act to alter and amend the Telegraph Act, 1869," gives to the post-office the exclusive privilege of transmission,—withheld in the previous Act,—empowers the purchase of telegraphic undertakings other than those included in that Act, and enables certain companies to require the postmaster-general to make such purchase. It also directs the raising by the treasury of a sum of £7,000,000 for the purposes of the Acts. The Act 33 and 34 Vict. c. 88 (1870) extended the post-office telegraphic system to the Channel Islands and to the Isle of Man; and that of the 34 and 35 Vict. c. 75 (1871) authorized the raising of an additional million. These sums collectively proved to be quite insufficient, and eventually the capital sum so raised exceeded £10,000,000. This large excess led to very blamable irregularities, during two or three years, in the post-office accounts by the temporary application of savings banks' balances, and the like, to telegraph expenditure,—irregularities which attracted the express censure both of the treasury and of the House of Commons. Probably no more arduous task was ever thrown upon a public department than that imposed on the post-office by this transfer of 1868-70. The reforms which it was to bring about were eagerly and impatiently demanded by the public. The utmost ingenuity that some of the old companies could exert, employ, or indirectly incite was used at first to prevent or impede the transfer and then to make it as difficult and as costly as possible.²

This great operation had to be effected without for one hour interrupting the public service. Thereupon the department had immediately to reduce and to simplify the charges of transmission throughout the kingdom. It had to extend the hours of business at all the offices. It had to extend the wires from railway stations lying outside of town populations to post-offices in the centre of those populations and throughout their suburbs. It had also to extend the wires from towns into rural districts theretofore wholly devoid of telegraphic communication. It had to effect a complete severance of commercial and domestic telegraphy from that of mere railway traffic; and in order to this severance it had to provide the railways with some 6000 miles of wires in substitution of those of which theretofore they had been joint users. It had, further, to provide at low charges, by all sorts of agencies, an effective "free trade" (so to speak) in the collection of news for the newspaper press, of which collection hitherto the old telegraph companies had possessed a virtual monopoly. It had to facilitate the transmission of money

orders by telegram.³ Finally, it had to amalgamate into one staff bodies of men who had formerly worked as rivals, upon opposite plans and with different instruments, and to combine the amalgamated telegraph staff with that of the postal service.

When under examination by the Commons' committee of 1868 Mr Scudamore had very modestly disclaimed⁴ the honour of originating anything with respect to the proposed transfer. Every part of the scheme had, he said, been borrowed from somebody else, and tried successfully elsewhere: the amalgamation of the telegraphic and postal administration in Victoria, New South Wales, Belgium, Switzerland, and to a certain extent in France; the institution of places of deposit for messages, in addition to the offices of transmission, in Belgium, as well as the gratuitous grant of postal facilities for telegraphic messages; telegraphic stamps in Belgium and France; a telegraphic money-order office in Switzerland and Prussia. But it is quite certain that Mr Scudamore, had he been put under examination at a later date, could have pointed to no precedent for labours like those imposed upon him and his able assistants by the Telegraph Acts of 1868-69.

So zealously was the work of improvement pursued that within little more than six years of the transfer (viz., in 1876) the aggregate extent of road wires in the United Kingdom was already 63,000 miles, that of railway wires 45,000,—in all 108,000 miles. The number of instruments in the telegraphic offices was 12,000. At that date the superintending and managing staffs of the post-office comprised 590 persons, the staff of the old companies with the relatively insignificant traffic of 1867—less than 6,000,000 messages as compared with 20,000,000—having been 534 persons.⁵ For supervision exclusively the number of officers was 88 against 86, and the relative cost £16,900 to the post-office as against £15,000 to the companies.⁶ At this date there were still no less than 1720 miles of the road wires carried over houses and across streets. In 1882 more than 1300 miles of these had been gradually removed and underground wires substituted.

The following table (XV.) shows the gross and nett revenue derived by the post-office from the telegraph service since the date of the actual transfer (Jan. and Feb. 1870).⁷

Year ended 31st March.	Total Telegraph Receipts (payments to Cable Companies and for Portage deducted).	Working Expenses charged to Telegraph Vote. ⁸	Nett Revenue (irrespective of interest on Capital Account).
1870 (two months) ...	£100,760	£62,278	£38,487
1871	697,934 ⁹	394,477	303,457
1873	989,921	874,946	114,975
1875	1,137,079	1,077,847	59,732
1877	1,313,107	1,123,790	189,317
1879	1,346,892	1,089,392	257,500
1881	1,610,907	1,242,092	368,815
1882	1,630,443	1,365,633	264,810
1883	1,740,063	1,504,204	235,859
1884	1,760,899	1,709,506	51,393

² Enumerated (Scudamore, *Supplementary Report*, p. 142) as amongst the objects aimed at by the post-office in accepting the transfer.

⁶ Lord John Manners to the treasury; see *Papers relating to Post-Office Telegraphs*, 1876 (Session Papers, No. 34), p. 2.

⁷ *Thirtieth Report of Postmaster-General*, 1884, p. 58.

⁸ This return is taken from the *Reports of the postmaster-general*, and is drawn up according to the appropriation account of each financial year. There are certain additional expenses (for buildings, stationery, manufacture of stamps, and rates) on account of the telegraph service which that account does not include. They raise the total cost of the telegraph service for 1881 to £1,308,454, for 1882 to £1,440,728.

⁹ Mr Scudamore's original estimate of yearly revenue was put at £608,000 (*Supplementary Report to Postmaster-General*, 1868, p. 147).

¹ *Report of Commons' Committee on Electric Telegraph Bill* (Session Papers of 1868, No. 435).

² Two instances out of more than twenty may suffice. The North-Eastern Railway Company claimed in compensation for its telegraphic department £540,292, besides a very large sum for interest; it was awarded, in all, £168,696. The metropolitan railway companies claimed, in all, £433,000, and were awarded £51,907 (*Twenty-fifth Report of Postmaster-General*, 1879, p. 21).

In the year 1882 a large increase in the working expenses became necessary for the further improvement and extension of the service, and for a very just increase in the remuneration of the telegraphists. In the report of that year the postmaster-general writes as follows:—"The annual interest on the capital sum of £10,880,571, raised by the Government for the purchase of the telegraphs, has not previously been included in the postmaster-general's accounts, because the amount is not provided for out of post-office votes; but in estimating the financial position it ought to be borne in mind that the chancellor of the exchequer has to meet a charge of £326,417 for this service out of the consolidated fund."¹

Progress of telegraph service.

The reduction of the unit of charge from a shilling to sixpence is a reform yet to come, but it is a reform expressly promised (*Thirtieth Report*, 1884, p. 5). It was originally proposed, in the Edinburgh chamber of commerce, at the outset of the public movement which led to the transfer of 1870. It has been repeatedly urged upon successive postmasters-general by the council of the London Society of Arts. On one of those occasions it was admitted by the postmaster-general that even at a sixpenny rate the telegraphs would eventually more than pay all expenses, including the current rate of interest upon the capital expended.² Two years later the urgent necessity of this reform was expressly stated by the same high authority in answer to a question put to him in the House of Commons. But he calculated that to effect it would involve a loss to the revenue for the first three years, which would probably amount to nearly £420,000 in the aggregate.

The chief dates in the history of the electric-telegraph service may be stated briefly thus. The first public line to work the patent of Wheatstone and Cooke was laid from Paddington to Slough on the Great Western line³ in 1843. The charge for a message up to fifty words was 1s. Before the end of the year 1845 lines exceeding in the aggregate 500 miles were at work in England on the same patent. In the following year the Electric Telegraph Company was established with a tariff of 1s. for 20 words within a radius of 50 miles, 1s. 6d. within 100 miles, 5s. if exceeding 100 miles. Remittance messages or telegraphic money-orders were established in 1850. In October of that year the first oceanic telegraph was worked for the Submarine Telegraph Company. In June 1854 a writer in the *Quarterly Review*⁴ put the question: "Is not telegraphic communication as much a function of Government as the conveyance of letters?" In January 1870 the telegraphs became, in pursuance of the Acts of 1868 and 1869, practically a branch of the post-office. In 1881 telephone exchanges were established, both by the post-office and by private companies under its licence, for terms of years, upon payment of a royalty. In 1884 (August and September) definitive arrangements were made between the post-office and the telephonic companies, thus terminating a long controversy and removing many mercantile heart-burnings.

Telephonic communication.

When the telegraphs were taken over by the Government telephonic communication had not yet come into practical use. But the principle and base of both methods are the same; and the Acts were framed to give the state a right to profit by improvements. In the course of the year 1880 several telephone companies established telephone exchanges in various parts of the kingdom. Means were immediately used by the postmaster-general to vindicate the law. On the 20th December of that year the question was brought to an issue in the Exchequer Division of the High Court of Justice. It was contended by the companies that "the telephone differed essentially from the telegraph,—the one transmitting electric signals, the other carrying the human voice by means altogether unknown when the post-office monopoly was granted." In the course of his judgment Mr Justice Stephen observed that, "if the telephone really transmitted the human voice, then communication by it could not be more rapid than the velocity of sound, whereas in fact it was instantaneous. In both

the communication is by electric signals." The Exchequer decision of December 1880 establishes once for all, not only that the telephone companies are quite outside of "the terms of the exceptions in section 5 of the Act of 1869," but also that "the Government monopoly is not limited to the property it acquired. It extends to all improvements in telegraphic communication."⁵ The postmaster-general used his victory with generous moderation. As the companies, he wrote, "were apparently under the belief that they had infringed no law, I held myself ready to meet them with liberal terms. The system of telephonic intercommunication is therefore now being extended partly through the agencies of companies and partly by the post-office."⁶ In the next annual report (1882) he added: "Licences were granted to the United Telephone Company,⁷ as representing the companies defendants to the suit, and to other private agencies to carry on the business of a telephone exchange in London and in various provincial towns, the department at the same time itself establishing exchanges in other places. The principle which underlay this arrangement was that only one telephone system should be established in any one town. Ultimately he came to the conclusion that it was undesirable . . . to create a monopoly in the matter of telephonic communication; and in future applications will be favourably entertained from responsible persons for licences to establish exchanges under conditions which may be regarded as giving adequate protection to the public and to the department."⁸

According to the *Situation des Réseaux Téléphoniques* for 1888, published by the International Telephonic Company at Paris, the contract between the British post-office and the London and Globe Telephone and Maintenance Company is for a term of twenty-nine years. The licence granted to the Telephone Company of Ireland provides that no exchange to be established thereunder by that company shall be within less than 4 miles of any post-office exchange. But, liberal as they were, the concessions made by Mr Fawcett in 1883 failed to satisfy the large and constantly-increasing claims of the telephonic interest. They claimed (1) entire practical freedom of control for their respective enterprises, (2) the reduction of the subsisting state royalty by one-half, (3) the extension of the commercial telephonic radius to 15 miles. As an alternative, they offered to continue the subsisting royalty if every sort of restriction and control were removed. Mr Fawcett firmly maintained the right of Her Majesty's post-office to continue the existing royalty, to establish at its discretion its own telephone exchanges throughout the realm, and to grant new licences irrespective of the old ones; he consented to abolish all limitations of radius or area, to subject trunk wires and exchange wires to like conditions, to withdraw the claim heretofore made by the department for an unlimited supply of the patented instruments used by the companies, and to permit the establishment by them of call-offices for local messages. But no company was to be licensed to receive and deliver written messages at any point. By this restriction telegraphic and telephonic messages were practically divaricated in service, although identical in law.

The subjoined table (XVI.) shows the total number⁹ of telegraphic Telegrams forwarded in England and Wales, Scotland, and Ireland, graph severally, at different years, since the transfer. statistics.

Year.	England and Wales.			Scotland.	Ireland.	Total of United Kingdom.
	Provinces.	London.	Total.			
1870-71	5,299,882	2,863,821	8,163,703	1,080,189	606,285	9,850,177
1871-72	6,594,590	3,612,772	10,207,362	1,388,434	878,000	12,473,796
1876-77	11,282,704	6,561,980	17,794,684	2,402,347	1,529,162	21,726,143
1881-82	14,204,479	12,071,084	26,275,513	3,207,994	1,862,854	31,346,861
1882-83	14,554,015	12,374,707	26,928,722	3,244,302	1,919,102	32,092,026
1883-84	14,920,413	12,686,483	27,606,846	3,299,428	1,986,846	32,843,120

The number of telegrams sent in proportion to population is now much greater in England than it is in the countries which were cited in the evidence of 1868 as in that particular outstripping others. The old companies, "by maintaining high charges as long as they could, by reducing those charges . . . only under pressure, by the confinement of their operations to important towns, and by planting their offices mainly in the business-centres of those towns, had brought speculative men, and speculative men only, to a free

⁵ See *Law Journal Reports* of January 1881.

⁶ *Twenty-seventh Report of Postmaster-General*, p. 5.

⁷ Upon an average this company paid to the post-office, under the arrangement so initiated, a sum of £15,150 a year. Its aggregate payments up to 31st December 1883 were only £35,500 (*Postal Gazette*, 1884, p. 490). In other countries the telephonic companies pay much more for their privilege. In Italy, for instance, there are fixed annual payments to the state over and above the royalty of 10 per cent., as in Britain.

³ The preliminary experiments of Wheatstone and Cooke had been successfully made on the North-Western line, between Euston station and Camden Town station, but at that date the North-Western Company declined to give facilities for working out the new enterprise.

⁴ Vol. xcv. p. 151.

use of the telegraph."¹ The development of the service will be apparent when it is stated that at the date of transfer to the state (1870) the number of telegraph offices did not exceed 3700. The number of messages in a year was 8,606,000. In 1884 they were respectively 6878 and (as above) 32,843,120. The yearly increment has lately averaged nearly 700,000. More striking still is the contrast of cost. In 1851 twenty words sent from London to Edinburgh cost 10s.; as late as 1862 they cost 4s.; since 1880 the cost has been reduced to 1s.; in August of the present year (1885) it will be reduced to 6d. Among the latest minor improvements of detail in the telegraph service is that which was effected in November 1882 by the abolition of the distinctive telegraph stamp, and the adoption of ordinary postage stamps for the payment of messages. Telegrams thus posted are conveyed, without extra charge, at the next collection of letters to the nearest telegraph office, whence they are transmitted by the wires at the earliest possible moment.²

During 1883 and 1884 great improvements were made in the telegraphic service of Scotland and also in the communication between Great Britain and Ireland. An additional cable was established between Fishguard and Blackwater. Four new land-lines were laid in connexion therewith, namely, from London to Fishguard, and from Blackwater to Dublin, Cork, and Limerick. There are now twenty-four wires available for use between Britain and Ireland contained in six cables. A new cable dépôt has been erected at Woolwich, and a cable-ship constructed (1883) expressly for post-office service. But the marvellous growth of telegraphy and telephony is best seen when we compare their statistics in individual towns. The daily average of messages in London, for example, was 450 in 1870 and nearly 6000 in 1883; in Derby 218 in 1870 and 898 in 1883. The staff at Derby in the former year was fourteen, in the latter year forty-six, and the instruments employed in the same years were respectively seven and twenty-seven.

*Government, Organization, Staff, and Regulations.*³

Adminis-
trative
position.

Originally and essentially the post-office is part of the domain of the crown of England. Practically its administration is controlled and regulated by statute. There were in 1883 no less than twenty-one several Acts of Parliament, or parts of Acts, which affected the postal administration, although at the commencement of the reign of Victoria the existing Post-Office Acts and parts of Acts (some-what more numerous still) were consolidated into a single statute,—a measure which had been previously resolved upon and in part prepared under the administration of the duke of Wellington.⁴ The responsibilities of common carriers do not extend to the postmaster-general or to any of his deputies. But a sub-postmaster is answerable in the ordinary courts of law for individual acts of negligence. And all subordinates of the postal service are, of course,

responsible to the postmaster-general, who may, and upon due cause will, besides other and official punishment, require them to make good to the sufferers losses which have been inflicted by proven breach of duty.⁵

The staff of the post-office department was composed as follows Staff on 31st March 1884 (Table XVII.):—

	Males.	Females.	Total.
1. Chief officers, secretariat, and surveyors	63	1	64
2. Head-postmasters	789	180	919
3. Sub-postmasters and letter-receivers	12,038	2,790	14,828
4. Clerks and superintending officers	2,293	616	2,909
5. Supervisors, countermen, sorters, telegraphists, &c.	10,074	2,115	12,189
6. Postmen, porters, &c.	15,269	8	15,277
7. Assistants and servants of various grades (unestablished)	28,829	16,139	44,968
8. Colonial postmasters and foreign agents	29	1	30
Grand total	60,384	21,800	91,184

The general post-office, London, is organized in seven principal departments, viz., (1) secretary's, (2) solicitor's, (3) receiver- and accountant-general's, (4) money order, (5) savings banks, (6) telegraphs, (7) circulation. The secretary's office has a general control over all the others.

At the beginning of 1858 the total number of post-offices in the United Kingdom was 11,101; at the beginning of 1884 it was 15,951. Of the former number 810 were head post-offices, of the latter number 921. In 1858 the number of street and road receiving-boxes was 703, in 1884 15,749.

The quarterly *Post-Office Guide* is now so widely known that we need say very little about rates of postage. Whilst a letter not exceeding 1 oz. passes for 1d., and one not exceeding 2 oz. for 1½d., one not exceeding 12 oz. is charged 4d., but for every weight exceeding 12 oz. a penny for each ounce, beginning with the first, is charged. There is no express limit to weight, but no letter, unless it be from or to a Government office, must exceed the dimensions of 18 × 9 × 6 inches. The uniform rate for a registered newspaper is ½d., unregistered newspapers pay the book-rate of ¾d. for every 2 oz. In weight no book-packet must exceed 5 lb., nor must it exceed in dimensions those prescribed for letters. The official post-card is impressed with a ½d. stamp; cards for reply, bearing two stamps, may be transmitted not only between places within the United Kingdom but between such places and many foreign countries (see *Post-Office Guide*). Petitions and addresses to Her Majesty and to the Houses of Parliament are exempt from charge up to a weight of 2 lb. Parliamentary proceedings are charged at the book rate, but are unlimited as to weight or size, and prepayment is optional, without entailing any increased rate of charge. The rates of the parcel post (1st August 1883) are—for 1 lb or part thereof 3d.; not exceeding 3 lb, 6d.; not exceeding 5 lb, 9d.; not exceeding 7 lb, 1s. The limits of size are 3 feet 6 inches in greatest length, and in length and girth combined 6 feet. In all cases parcels must be prepaid in adhesive stamps. The rule as to registration is held to be inapplicable to postal parcels; but in January 1885 a useful system of stamped certificates of the postage of parcels was introduced. For foreign rates of postage and for all like details we necessarily refer to the *Post-Office Guide* above-mentioned.

In social importance no branch of postal administration exceeds its savings banks system and the dependencies attached to it. At every post-office forms can be obtained on which twelve penny postage stamps can be fixed, which will be received as a postal savings bank deposit for a shilling, provided a due declaration be made that the depositor has no account with any other savings bank. When the deposit reaches £1, interest at the rate of 6d. a year on each pound is given. The depositor can withdraw his money (which may accrue to the limit of £30 in any one year) from any one of the 7475 post-office banks. At any such office a person who wishes to invest £10 or any larger sum up to £100 in Government stock can do so at the current price of the day.

In conclusion we add a brief retrospective survey of the more salient incidents, in chronological order, of the British post-office. (1533) First appointment of a postmaster-general for England; (1591) partial organization of rudimentary English post-office; (1619) appointment of a special postmaster-general for "foreign parts"; (1635) reorganization of English post-office under Thomas Witherings; (1665) settlement of post-office revenue on James, duke of York, and his heirs-male; (1680) establishment of a metropolitan penny post by William Dockwra; (1711) consolidation of Postal Acts by statute 9 Queen Anne, c. x.; (1720) organization of cross-road and rural posts under Ralph Allen; (1753) organization of post-office of American colonies under Benjamin Franklin; (1784)

⁵ Compare the judgment given in *Lane v. Cotton*, in Lord Raymond's Reports, i. 646, with that in *Whitfield v. Lord Le Despencer* (postmaster-general, 1766-1781), in Cowper's Reports, 754, and with that in *Browning v. Goodchild*, in Wilson's Reports, iii. 443.

¹ Scudamore, *Report on the Reorganization, &c.*, p. 17.

² *Twenty-eighth Report of Postmaster-General*, 1882, p. 5.

³ The details are given at length in the *Law Journal Reports* for 1884. A good summary may be found in *The Postal and Telegraphic Gazette*, 1884, pp. 660-662.

⁴ Hansard, *Parliamentary Debates*, series iii., vol. i. pp. 706, 779. We cannot here enumerate the subsisting Acts otherwise than in briefest form. (1) The general administration and working of the department, the rates of postage, and the appropriation of the revenue thence accruing are governed by—7 William IV. and 1 Vict. c. 33 (July 1837); 3 and 4 Vict. c. 96; 10 and 11 Vict. c. 85 (1847); 33 and 34 Vict. c. 79 (1870), and *ibid.* c. 98, §§ 9-12; 34 and 35 Vict. c. 30 (1871); 38 and 39 Vict. c. 22 (June 1875); 44 and 45 Vict. c. 19 (1881), and *ibid.* c. 12, § 47. (The Act 33 and 34 Vict., amongst other valuable improvements, extends the book-parcel post, and contains an express clause empowering the treasury to regulate by warrant postage rates from time to time. Yet there is a whole series of subsequent Acts regulating such rates. The Act 38 and 39 Vict. arose out of the provisions of the international postal treaty at Bern of 9th October 1874 (see below, p. 584), and empowers the treasury to regulate foreign and international rates of postage in accordance with these provisions.) (2) The money-order branch is regulated by 3 and 4 Vict. c. 96, § 38 (1840), and by 43 and 44 Vict. c. 33. (3) The savings banks branch is regulated by 22 and 23 Vict. c. 53 (1859); 24 and 25 Vict. c. 14 (1861); and 37 and 38 Vict. c. 73 (1874). (4) The annuities and life insurance branch is governed by 27 and 28 Vict. c. 43 (1864); this statute applies also to savings banks managed by trustees (see SAVINGS BANKS). (5) The telegraphs branch is regulated by 31 and 32 Vict. c. 110 (1867-68); 32 and 33 Vict. c. 73 (1868-69); 34 and 35 Vict. c. 75 (1871); and 41 and 42 Vict. c. 76 (1878). (6) The acquisition of lands for post-office purposes is facilitated by 44 and 45 Vict. c. 20 (1881). Finally, (7) the parcel-post branch is provided for by 46 and 47 Vict. c. 58 (1883).

establishment of improved mail-coaches and of well-organized mail-routes, under John Palmer of Bath; (1821) first conveyance of mails by steam-packet; (1830) first mail-coach by railway; (1834, August) postage stamp invented at Dundee by James Chalmers; (1835) establishment of the overland route to India, mainly by exertions of Lieutenant Waghorn; (1837) Sir R. Hill's postal reform initiated; (1838) establishment of postal money-order office; (1840, January) general and uniform penny post (per half ounce) established; (1855, March) first street letter-box put up in London; (1855, June) book-post organized; (1856) metropolitan postal districts established and *Postal Guide* issued; (1861) postal savings banks instituted; (1870) transfer of telegraphs to the state; (1870) postal cards introduced; (1870) improved postal treaty with Napoleon III. concluded; (1871) postal unit of charge reduced to one penny per ounce; (1874) International Postal Union established at Bern; (1875) further consolidation of the post-office statutes; (1881, January) postal orders issued; (1883, August) parcel post established; (1884, October) entrance of the Australian colonies into the Postal Union.

BRITISH COLONIES AND DEPENDENCIES.

Australia and New Zealand.—In 1873 there were 2668 post-offices open; 38,980,352 letters (including South Australian and New Zealand packets) and 22,018,483 newspapers and packets were transmitted; 303,741 money orders, amounting to £754,847, were issued; there were 185,202 depositors in the post-office savings banks, whose deposits amounted to £2,081,288; over 20,659 miles of telegraph lines were open; 2,100,272 messages were transmitted, from which an income of £211,276 was derived, while the expenditure (exclusive of South Australia) amounted to £186,681. Western Australia is omitted from these figures owing to the inadequacy of the Government returns. These figures, compared with the population of 1873, show that over 18 letters and over 10 newspapers and packets per head were transmitted; that money orders were issued to 1 in about every 7 persons, at an average value of nearly £2, 10s. per order; that deposits in the post-office savings banks averaged a little over 1 in 11 of the entire population, at an average value of £11, 4s. per deposit; that of telegraph messages there was about one to each person.

In 1883 there were 4410 post-offices open; 123,614,387 letters and post-cards, 10,434,461 packets, and 60,889,570 newspapers (including South Australian packets) were transmitted; the revenue of the postal department amounted to £1,057,100, and the expenditure to £1,287,679; 783,701 money orders were issued, amounting to £2,608,915; there were 254,510 depositors in the post-office savings banks, and their deposits amounted to £4,537,706; there were over 57,174 miles of telegraph, and 7,083,163 messages were transmitted, the value of which was estimated at £476,683; the expenditure of the telegraph departments amounted to £345,590, but it must be explained that the Victorian, South Australian, and West Australian expenditures were included in those of the postal departments. These figures, compared with the population of 1883, show that there were transmitted per head nearly 40 letters and post-cards, and over 23 newspapers and packets; to every third person a money order was issued, at an average value of about £3, 6s. 6d. per order; the number of deposits in the post-office savings banks averaged about 1 in every 12 of the population, and their average value was over £17, 6s. per deposit; the telegraph messages were transmitted at the rate of rather more than two messages to each person.

Canada.—During the year which ended on 30th June 1884 the number of letters conveyed by the mails throughout the Dominion of Canada was 66,100,000 as against 62,800,000 in the corresponding year 1883; that of post-cards was 13,580,000 as against 12,940,000. The number of letters registered was 3,000,000 against 2,650,000. The number of money orders issued was 463,502, their aggregate value being £2,068,726. Of this amount £1,638,060 was for inland orders, £430,666 for foreign orders. The number of Canadian post-offices was 6837 against 6395 in 1883; the length of postal routes open was 47,131 miles, showing an increase over the previous year of 2488 miles. The distance traversed thereon

by the mails in 1884 was 20,886,316 miles. Of the 6837 post-offices 866 were also money-order offices. In 1884 international money orders were extended to the principal countries of the Postal Union and to all British possessions abroad. In 1884 the amount of foreign money orders paid in Canada was £252,600. In 1884 the number of post-office savings banks was 343, the number of depositors' accounts 66,682 (an increase of 5623 over 1883), and total amount in deposit £2,650,000.

India.—In order to illustrate the growth of the post-office in India we give the salient statistics for 1873 and 1883. In British India and the native states the total number of post-offices in 1883 was 5310, showing an increase of 2304 since 1873. In 1883 the number of letters of all descriptions that passed through the post-office was 135,709,147, in 1873 it was 83,127,098. Post-cards were not issued until 1880, when they numbered 7,471,984, which number had increased to 29,844,347 in 1883. In the last-quoted year 18,501,171 newspapers, parcels, and packets passed through the post and 10,030,216 in 1873. In 1883 2,565,904 postal money orders, representing a value of £6,468,418, were issued. Adding the number of money orders to the total of letters, newspapers, &c., for the year 1883 we obtain an aggregate of 186,620,569, equal to 0.73 per head of population. Post-office savings banks were opened in India on 1st April 1882; during the first year the deposits reached a total of £435,356, or including interest (£4902) £440,258. Deposits amounting to £160,578 were withdrawn during the year, leaving a balance of £279,680 on 31st March 1883. The total length of Government telegraph lines increased from 46,386 miles in 1873 to 84,700 miles in 1883. The expenditure in both years under consideration exceeded the receipts: whilst in 1873 the figures were respectively £704,193 and £677,047, in 1883 they were £983,779 and £971,639. (E. ED.)

UNITED STATES.

The early history¹ of the post-office in the British Early colonies in North America has been briefly referred to history. above (pp. 565, 566). Benjamin Franklin was removed by the home department from his office of postmaster-general in America in 1774. On 26th July 1775 the American Congress assumed direction of the post-offices, re-appointing Franklin to his former post. Shortly afterwards, when Franklin was sent as ambassador to France, his son-in-law, Richard Bache, was made postmaster-general in November 1775.

In 1789 the number of post-offices was 75, in 1800 903, Growth. in 1825 5677, in 1875 35,734, and in 1884 50,017. In 1789 the gross revenues of the postal service were \$30,000, in 1800 \$280,804. In 1860 the gross revenues had increased to \$8,518,067 and in 1875 to \$26,671,218. In 1884 they amounted to \$43,338,127.08. In 1860 there was a deficit in the postal income of \$10,652,542.59, occasioned through lavish expenditure and then existing abuses. Annual deficiencies had occurred for nine years previous to 1860, and continued for twenty-one years thereafter. In 1882 a surplus of \$1,394,388.92 was shown, and in 1883 a profit of \$1,001,281.83. The percentage of deficit continued steadily to decrease after 1860, and in 1882, for the first time in thirty-one years, the postal service ceased to be a burden upon the treasury. It is not to be doubted that adverse natural conditions operated for many years to prevent or to postpone this favourable result, among them the vast extent of territory embraced within the confines of the republic, entailing costly service over long routes, and the extraordinarily rapid development of the western States and Territories, conditions which militate against the United States in a comparison of the statistics of its postal service during that period with those of the service of countries having more limited areas.

Until 1863 the rates of postage were based upon the distances over which the mails were conveyed. In 1846 these rates were—not exceeding 300 miles, three cents; exceeding 300 miles, ten cents. In 1851 the rates were reduced to three cents for distances not exceeding 3000 miles and ten cents for distances exceeding 3000 miles. The use of adhesive postage stamps was first authorized

¹ For early statistics (1790-1856) of the United States post-office, see *Ency. Brit.*, 8th ed., vol. xviii. pp. 419, 420.

by Act of Congress, approved 3d March 1847, and on 1st June 1856 prepayment by stamps was made compulsory. In 1863 a uniform rate of postage without regard to distance was fixed at three cents, and on 1st October 1883, after satisfactory evidence had been given of the surplus income from the operations of the post-office establishment for the two preceding fiscal years, the rate was further reduced to two cents, the equivalent of the British penny postage. It will be seen that no time was lost in giving to the public the benefit of the change for the better in the condition of the postal finances, and to this liberality is undoubtedly due in great measure the deficit of \$5,204,484.12 for the year 1884, a deficiency which, however, it is reasonable to expect, will decrease from year to year under the stimulus given to correspondence by the cheapened rate. It is hardly remarkable, in view of the great area of the United States, that for a long time distance should have formed a very material element in the calculations for levying postal tribute.

Convey-
ance of
mails.

The franking privilege, which had grown to be an intolerable abuse, was finally abolished in 1873, and the post-office now carries free under official "penalty" labels or envelopes (*i.e.*, envelopes containing a notice of the legal penalty for their unauthorized use) nothing but matter which is of a strictly official character, with the single exception of newspapers circulated within the county of publication. As late as 1860 the mails conveyed nothing but written and printed matter. They now admit nearly every known substance which does not exceed four pounds in weight (this restriction does not apply to single books), and which from its nature is not liable to injure the mails or the persons of postal employés.

The railway mail service, including the "fast mail," the character of which is from the necessity of the case peculiar, and which, in its methods and results, has reached a perfection attainable only in a country of great extent, was inaugurated in 1864 after a successful experiment upon a few of the large railroad lines with important termini. In 1865 one thousand and forty one miles of railway post-office service were in operation, employing sixty-four clerks. The service was reorganized in 1874 with eight territorial divisions, each in charge of a superintendent subordinate to a general superintendent at the seat of government. This service was one of the earliest exponents of a classified civil service in the more recent acceptance of that term in the United States, appointment of railway-postal clerks having always been made for a probationary period, permanent appointment conditioned upon satisfactory conduct and service, and removal based upon good cause only. On 1st July 1884 there were about four thousand clerks in the railway mail service, and the length of the routes was 117,160 miles. The annual transportation (aggregate distance over which the mails were conveyed) was 142,541,392 miles. At the same date the length of the "star service" routes (*i.e.*, mail service other than by railway or steamboat) was 226,779 miles and the annual transportation 81,109,052 miles, while the length of the steamboat routes was 15,591 miles with an annual transportation of 3,882,288 miles, which does not include conveyance of mails by sea to foreign countries.

The penny post existed in a number of cities of the Union in 1862, the carriers remunerating themselves by the collection of a voluntary fee of from one to two cents on each piece of mail delivered. A uniform free delivery system was first authorized by law on 3d March 1863, and was established on the succeeding 1st of July in forty-nine cities. The number of carriers employed the first year was 685. On 1st July 1884 there were 3890 letter-carriers in one hundred and fifty-nine "free delivery cities."

To the European reader this number will doubtless appear to be remarkably small in a country whose population, according to the census of 1880, was over 50,000,000, but it should be observed that, outside of the larger cities and towns, the people as a rule reside on detached farms of greater or less size, at considerable distances from each other, and not, as in many of the European states, congregated in small towns or villages, separated from their farms; from this circumstance it happens that rural factors or carriers have never been, and could not well be, employed as in European countries.

The registry system, in which great improvements have been made within the last few years, did not attain any degree of excellence until after 1860; and the money-order system was first established in 1864. The aggregate number of money orders, domestic and foreign, issued during the fiscal year 1883-84 was 8,314,963, of the value of \$129,810,038.51. Postal notes for small sums, payable to bearer, and resembling the British postal orders except in that they are not drawn for fixed amounts, were first issued to the public in September 1883, and during the first ten months there were 3,689,237 notes sold of the aggregate value of \$7,411,992.48. Money orders are exchanged, in pursuance of postal conventions for the purpose, with most of the important countries of the world which have money-order systems of their own.

The total staff of the post-office in 1884 numbered 71,671, of whom 50,017 were postmasters. For the same year the total number of letters delivered in 159 cities was 524,431,327. The number of post-cards delivered in the same cities was 166,652,429, and the number of newspapers 231,645,185. The number of registered letters and parcels sent through the mails was 11,246,545, and the total ascertained losses numbered 516, or in the ratio of 1 to 21,795. During the same year the total number of pieces of mail handled or distributed *en route* on the cars by railway postal clerks was 4,519,661,900, of which number 2,795,447,000 were letters,—a total increase over the previous year of 13½ per cent., the transactions of that year having themselves exceeded those of the year 1882 by nearly 16 per cent. The sales of stamps, &c., for the year amounted to \$40,745,853.66, showing that almost the entire revenues of the service are derived from postages. The total estimated number of letters sent to foreign countries was 33,328,014, of post-cards 1,672,458, of packets of newspapers, &c., 20,712,464, and of packages of samples of merchandise 297,048. There were received from foreign countries 28,404,035 letters, 1,288,673 post-cards, 21,747,784 packets of newspapers, &c., and 519,561 packets of samples of merchandise. The total number of articles of undelivered mail received in the dead-letter office was 4,843,099, of which number 4,752,483 were letters, being nearly a million less than the number which reached the British returned-letter office. Useful printed matter which cannot be returned is distributed amongst the inmates of various hospitals, asylums, and charitable and reformatory institutions in the District of Columbia, and in 1884 23,152 magazines, pamphlets, &c., were thus disposed of.

Three years after the passage by the British parliament of the Tele-Electric Telegraph Act (1868-69) the subject of a similar transfer of the rights of the telegraph companies to the post-office of the United States was strongly urged by the postmaster-general of that country, Mr Creswell, and he renewed his recommendations the succeeding year; the subject also recurred at intervals in the annual reports of the post-office department for subsequent years. In 1882 Mr Howe admitted that he had been "forced to the conclusion that the time has fully come when the telegraph and postal service should be embraced under one management"; a year later, however, Mr Gresham states that he "should hesitate to sanction a measure providing that the United States shall become the proprietor of telegraph lines and operate them by its officers and

Late statistics.

agents." Mr Hatton in his first report as postmaster-general, that for 1884, is silent upon this subject.

Savings
banks.

Mr Creswell took occasion in 1871 to recommend also the establishment of postal savings banks in the United States, and this subject he made of peculiar interest at the time by the suggestion that the money needed to purchase existing telegraph lines could be raised through the postal savings banks, certainly a timely suggestion to accompany the two simultaneous recommendations. The establishment of postal savings banks has also been the frequent subject of departmental and congressional discussion without decisive action. The utility and expediency of the measure have not been doubted, but singularly enough what has seemed to be an insuperable obstacle to the inauguration of the system has been encountered. The policy of the Government, with its vast surplus revenue of late years, has been to gradually and surely reduce the national debt, which, it would seem from the progress already made in that direction, is certain of ultimate extinction in the course of a few years. It is plain, however, although the difficulty does not seem to have occurred to many of the advocates in the United States of a savings banks system, that to be lasting it must be founded upon a permanent Government debt, a condition which does not and is not likely to exist in that country. Interest cannot be paid to depositors for funds which are not needed and which cannot be profitably employed. Until this problem is solved, it is not probable that this feature will be added to the postal system of the United States, where, however, the practice of careful economy has not yet become a common habit of the masses of the people, and where the security for small savings afforded by Government institutions would tend to foster habits of thrift. A Bill to establish a postal savings depository as a branch of the post-office department was introduced in the House of Representatives on 8th February 1882, and an elaborate report was made thereon, 21st February 1882, by the committee on the post-office and post-roads, to whom the Bill had been referred. The measure was never acted upon and has not since been revived. (W. B. C*.)

FRANCE.

Early
history.

The French postal system was founded by Louis XI. (19th June 1464), was largely extended by Charles IX. (1565), and received considerable improvements at various periods under the respective Governments of Henry IV. and Louis XIII. (1603, 1622, 1627 *sq.*).¹ In the year last-named (1627) France, so often during long ages pre-eminent in "teaching the nations how to live," originated a postal money-transmission system, expressly prefaced by those cautions about transmission of coin in ordinary letters which are now familiar to all eyes in the windows of English post-offices (but which no eyes saw there a dozen years ago), and in the same year it established a system of cheap registration for letters. The postmaster who thus anticipated 19th-century improvements was Pierre d'Alméras, a man of high birth, who gave about £20,000 (of modern money) for the privilege of serving the public. The turmoils of the Fronde wrecked much that he had achieved. The first farm of postal income was made in 1672, and by farmers it was administered until June 1790. To increase the income postmasterships for a long time were not only sold but made hereditary. Many administrative improvements of detail were introduced, indeed, by Mazarin (1643), by Louvois (*c.* 1680 *sq.*), and by Cardinal de Fleury (1728); but many formidable abuses also continued to subsist. The revolutionary Government transferred rather than removed them. Characteristically, it put a board of postmasters in room of a farming postmaster-general and a controlling one. The keen and far-seeing mind of Napoleon (during the consulate²) abolished the board, recommitted the business to a postmaster-general as it had been under Louis XIII., and greatly improved the details of the service: Napoleon's organization of 1802 is, in substance, that which obtains in 1885, although, of course, large modifications and developments have been made from time to time.³

¹ For the details, see *Ency. Brit.*, 8th ed., vol. xviii. pp. 420-424, and Maxime Du Camp, "L'Administration des Postes," in *Revue des Deux Mondes* (1865), ser. 2, lxvii. 169 *sq.*

² 28 Pluviose, an XII.—18th February 1804.

³ Le Quien de la Neuville, *Usages des Postes*, 1780, pp. 59-67, 80, 121-123, 147-149, 286-291; Maxime Du Camp, *op. cit.*, *passim*; Pierre

The university of Paris, as early as the 13th century, possessed a special postal system, for the abolition of which in the 18th it received a large compensation. But it continued to possess certain minor postal privileges until the Revolution.⁴

Mazarin's edict of 3d December 1643 shows that France at that date had a parcel post as well as a letter post. That edict creates for each head post-office throughout the kingdom three several officers styled respectively (1) comptroller, (2) weigher, (3) assessor; and, instead of remunerating them by salary, it directs the addition of one-fourth to the existing letter rate and parcel rate, and the division of the surcharge between the three. Fleury's edicts of 1728 make sub-postmasters directly responsible for the loss of letters or parcels; they also make it necessary that senders should post their letters at an office, and not give them to the carriers, and regulate the book-post by directing that book parcels (whether MS. or printed) shall be open at the ends.⁵ In 1758, almost eighty years after Dockwra's establishment of a penny post in London, an historian of that city published an account of it, which in Paris came under the eye of a man of similar spirit and enterprise to Dockwra. Claude Piarron de Chamousset⁶ obtained letters-patent to do the like, and, before setting to work or seeking profit for himself, he issued a tract with the title, *Mémoire sur la petite-poste établie à Londres, sur la modèle de laquelle on pourrait en établir de semblables dans les plus grandes villes d'Europe*. The reform so worthily begun was successfully carried out.

By this time the general post-office of France was producing a considerable and growing revenue. In 1676 the farmers had paid to the king £48,000 in the money of that day. A century later they paid a fixed rent of £352,000, and covenanted to pay in addition one-fifth of their nett profits. In 1788—the date of the last letting to farm of the postal revenue—the fixed and the variable payments were commuted for one settled sum of £480,000 a year. The result of the devastations of the Revolution and of the wars of the empire together is shown strikingly by the fact that in 1814 the gross income of the post-office was but little more than three-fifths of the nett income in 1788. Six years of the peaceful government of Louis XVIII. raised the gross annual revenue to £928,000. On the eve of the revolution of 1830 it reached £1,348,000. Towards the close of the next reign the post-office yielded £2,100,000 (gross). Under the revolutionary Government of 1848-49 it declined again (falling in 1850 to £1,744,000); under that of Napoleon III. it rose steadily and uniformly with every year. In 1858 the gross revenue was £2,296,000, in 1868 £3,596,000.

The most important postal reforms in France (other than those which we have already noticed) are briefly these:—(1) the extension of postal facilities to all the communes of the country,—effected under Charles X., placing the France of 1829 in certain postal particulars in advance of the United States of 1879; (2) the adoption of postage

Clément, *Appréciation des Conséquences de la Réforme postale*, *passim*; Loret, *Gazette rimée*, 16th August 1653; Furetière, *Le Roman Bourgeois* (in Du Camp, *ut supra*); "Die ersten Posteinrichtungen, u.s.w.," in *L'Union Postale*, viii. 138; *Ordonnances des Rois de France*, as cited by A. de Rothschild, *Histoire de la Poste-aux-Lettres*, i. 171, 216, 269 (3d ed., 1876). We quote M. de Rothschild's clever book with some misgivings. It is eminently sparkling in style, and most readable; but its citations are so given that one is constantly in doubt lest they be given at second or even at third hand instead of from the sources. The essay of M. Du Camp is, up to its date, far more trustworthy. He approaches his subject as a publicist, M. de Rothschild as a stamp-collector.

⁴ There are several charters confirmatory of this original privilege. The earliest of these is of 1296 (Philip "the Fair").

⁵ *Ordonnances*, &c., as above.

⁶ There is an interesting biographical notice of Piarron de Chamousset in *Le Journal Officiel* of 5th July 1875.

stamps,—effected under the presidency of Louis Napoleon (1849); (3) the organization of an excellent system of not only transmitting but insuring articles of declared value, whatever their nature,—effected under Napoleon III. (1859); (4) the issue of postal notes payable to bearer (1860); (5) the establishment of a post-office library (1878); (6) the creation of postal savings banks (1880).

France, as we have seen, possessed a postal money-transmission service as early as 1627. But for almost two centuries the thing the remitter delivered at the post-office was the thing given to the payee, whether it were coin or paper money. In 1817 the money-transmission service became a money-order service. In that year the aggregate value of inland money orders was £364,000, in 1830 £528,000, in 1845 £844,000, in 1864 £4,520,000, in 1868 £6,280,000, in 1877 £9,238,644, in 1878 £11,036,712, in 1881 £18,793,188, in 1882 £19,655,117, in 1883 £20,770,078. The average amount of each order varied very little during the fifty-eight years 1821 to 1878, ranging only between 28 francs 62 centimes and 30 francs (twenty-four shillings). The number of orders was in the first-named year only 317,642. In 1868 the number was (in round figures) 5,320,000; in 1878 it had grown to 9,304,840, in 1881 to 14,626,117, in 1882 to 15,791,774, and in 1883 to 16,808,627.¹ The average amount of each order has been, since 1878, somewhat upon the increase.² France may also fairly claim to have been in advance of the United Kingdom not only in facilities for the safe transmission of money and other precious commodities but also in the facilities of book post and parcel post. In the tariff for ordinary correspondence, however, it has always contrasted unfavourably. Whilst under the regulations of January 1849 and of July 1854 respectively the letter tariff was double that of Great Britain, it has come to be treble since the adoption by the latter country of the one-ounce unit of charge; 1½d. is the French rate under the regulation (M. Cochery's) of 1st May 1878 for a half-ounce letter; 1d. is the English rate for an ounce letter. Post-cards are charged double the English rate.³ The growth of postal correspondence in France prior to the great check inflicted by the calamities of 1870-71 may, very briefly, be shown thus:—

TABLE XVIII.—Comparative Numbers of Letters, Newspapers, and Books conveyed.

	Ordinary Letters. ⁴	Registered Letters.	Newspapers and Book-Parcels.
1848	126,480,000	176,000	c. 4,500,000
1857	252,921,942		
1867			c. 15,000,000
1868	349,335,000	4,850,000	..

Pigeon and balloon posts.

The ingenuity of the French postal authorities was severely tried by the exigencies of the German War of 1870-71; but they proved themselves singularly successful in maintaining a correspondence, inland and foreign, under difficulties which were probably greater than any postal staff had ever before had to encounter since posts were known. The first contrivance was to organize a pigeon service,⁵

¹ These figures apply only to inland orders issued.

² Bernard, "Notice sur le Service postal en France," in *Journal des Économistes*, ser. 3, xv. 366-385; *Statistique générale du Service postal*, 1881, v. sq.

³ *Recueil de Renseignements sur le Régime postal*, 5; *Annuaire des Postes*, for various years, to 1883 inclusive, *passim*. Comp. *Reports of Secretaries of Embassy*, &c., France (1879), 5.

⁴ During the years from 1849 to 1857 ordinary letters in France increased at the annual rate of 12½ per cent. (under Napoleon III. as president and as emperor); during the rest of his rule the yearly rate of increase is calculated (to 1869 inclusive) at 3½ per cent. only.

⁵ The employment of pigeons as carriers of despatches dates from a very early period, the curious annals of which are given in *Die Taubenpost* (Berlin). It was not, however, until the commencement of the present century that they were systematically utilized as bearers of messages to the sporting and other papers. Before the organization of the electric telegraph pigeons were regularly employed by the members

carrying microscopic despatches prepared by the aid of photographic appliances.⁶ The number of postal pigeons employed was 363, of which number fifty-seven returned with despatches. During the height of the siege the English postal authorities received letters for transmission by pigeon post into Paris by way of Tours, subject to the regulations that no information concerning the war was given, that the number of words did not exceed twenty, that the letters were delivered open, and that 5d. a word, with a registration fee of 6d.,⁷ was prepaid as postage. At this rate the postage of the 200 letters on each folio was £40, that on the eighteen pellicles of sixteen folios each, carried by one pigeon, £11,520. Each despatch was repeated until its arrival had been acknowledged by balloon post; consequently many were sent off twenty and some even more than thirty times. The second step was to establish a regular system of postal balloons, fifty-one being employed for letter service and six for telegraphic service. To M. Durnouf belongs very much of the honour of making the balloon service successful. On the basis of experiments carried out by him a decree of 26th September 1870 regulated the new postal system. Out of sixty-four several ascents, each costing on the average about £200, fifty-seven achieved their purpose, notwithstanding the building by Krupp of twenty guns, supplied with telescopic apparatus, expressly for the destruction of the postal balloons. Only five were captured, and two others were lost at sea. The aggregate weight of the letters and newspapers thus aerially mailed by the French post-office amounted to about eight tons and a half, including upwards of 3,000,000 letters; and, besides the aeronauts, ninety-one passengers were conveyed. The heroism displayed by French balloon postmen was equalled by that of many of the ordinary letter-carriers in the conveyance of letters through the catacombs and quarries of Paris and its suburbs, and, under various disguises, often through the midst of the Prussian army. Several lost their lives in the discharge of their duty, in some cases saving their despatches by the sacrifice. No less than eighty-five faced the extremity of danger.⁸ During the war the Marseilles route for the Anglo-Indian mails was, of course, abandoned. They were sent through Belgium and Germany, by the Brenner Pass to Brindisi, and thence by Italian packets to Alexandria. The French route was resumed in 1872.⁹

Before dealing with the latest statistics of the French postal system, it may be of interest to cite from *L'Union Postale* of Bern statistics (ii. 87 sq.) a brief comparison of the mail matter within the limits of Paris with that of the state at large in the year 1874 (Table XIX.).

	Paris.	France.
1. Ordinary chargeable letters.....	95,791,000	348,808,000
2. Registered chargeable letters	1,730,000	6,786,000
3. Franked letters	8,985,000	56,584,000
4. Newspapers, books, mercantile patterns..	242,618,000	368,782,000
5. Money orders	647,400	4,793,680
Grand total of mailed articles.....	349,716,400	780,703,680 ¹⁰

The reader will observe on glancing from this table to Table

of the stock exchange for conveying early intelligence of the state of the money markets in Paris, &c., the entire journey being broken up into short relays, so that transmission of messages might be secured even during unfavourable weather.

At the present time all the important fortresses in France and Germany have their staff of voyageur or homing pigeons that are well trained for 50 to 100 miles, so that they could be relied on for holding communication with the fortress in case it should be surrounded by hostile troops. The utility of these birds in conveying messages from the sea in case of war has not yet been recognized in Britain.

⁶ The despatches carried by the pigeons were in the first instance photographed on a reduced scale on thin sheets of paper, the original writing being preserved, but after the ascent of the twenty-fifth balloon leaving the city an improved system was organized. The communications, whether public despatches or private letters, were printed in ordinary type, and micro-photographed on to thin films of collodion. Each pellicle measured less than 2 inches by 1, and the reproduction of sixteen folio pages of type contained above 3000 private letters. These pellicles were so light that 50,000 despatches, weighing less than 1 gramme, were regarded as the weight for one pigeon. In order to ensure their safety during transit the films were rolled up tightly and placed in a small quill which was attached longitudinally to one of the tail feathers of the bird. On their arrival in Paris they were flattened out and thrown by means of the electric lantern on to a screen, copied by clerks, and despatched to their destination. This method was afterwards improved upon, sensitive paper being substituted for the screen, so that the letters were printed at once and distributed.

⁸ Boissay, "La Poste et la Télégraphie pendant le Siège de Paris," in *Journal des Économistes*, ser. 3, xxii. 117-129 and 273-282. Compare *Postal Gazette*, i. 7 (1883).

⁹ *Sixteenth Report of the Postmaster-General*, p. 8.

¹⁰ *Statistique générale du Service postal* (Bern, 1882-83), *passim*.

XVIII. that in 1874 the ordinary correspondence of France had not recovered its former extent, as it stood in 1868, although a large relative increase is shown in the number of registered letters during 1874 as compared with those of 1868. Taken as a whole, the postal traffic did not fully recover itself until 1878; and even then, although the mailed articles exceeded those of the year immediately preceding by 124,310,199, the gross revenue accruing from letters, newspapers, and parcels showed a diminution of £788,150 as compared with the gross revenue of 1877. Thenceforward the progress is rapid. The chief postal laws now in force are of 6th May 1827, 4th June 1859, 25th January 1873, 3d May 1876, 6th April 1878, 5th February 1879, and 9th April 1881.

The comparative postal statistics for all France during the years 1881, 1882, and 1883 stand thus:—

TABLE XX.—Number of Letters and Post-Cards.

	1881.	1882.	1883.	Tunis and Algiers 1883.
Inland letters	535,541,373	544,103,583	563,524,119	8,550,266
Inland post-cards	29,589,094	30,710,500	31,394,427	69,038
" reply post-cards	37,326	48,480	50,000	8,492
Foreign letters sent	34,308,085	35,377,325	36,777,164	331,283
Foreign post-cards sent ..	1,216,048	1,300,030	1,462,615	10,755
" reply post-cards	30,005	41,184	53,323	308
Total	600,783,731	611,701,082	633,261,848	8,965,172

In 1882 the gross revenue of the entire French postal service was £6,170,146, the total expenditure £5,338,273, and the nett revenue £831,873. In 1883 the gross revenue amounted to £6,429,101, the expenditure to £5,678,851, and the nett revenue to £750,250. In 1881 the number of post-offices throughout France was 6158 plus 53,182 letter-boxes, making the total number of postal receptacles 59,340. In 1884 the number of post-offices proper had increased to 6565.² The aggregate of the postal and telegraphic staff was 49,121 persons in 1881, 50,268 in 1882, and 52,636 in 1883.³ The relative number of letters (including post-cards) to each inhabitant was 16 in 1881 as compared with 27 to each inhabitant in the United States, and with 38 to each in the United Kingdom. In 1882 the proportion was 16½, as compared with 40½ in Great Britain, in 1883 16½, and 41½ respectively. Were it possible to deduct in each case the useless, the merely undesired advertising communications, France would contrast with Britain, and still more with America, far less disadvantageously than, on the mere face of the figures, it seems to do.

The savings banks system of France, so far as it is connected with the postal service, dates only from 1875, and began then (at first) simply by the use of post-offices as agencies and feeders for the pre-existing banks. Prior to the postal connexion the aggregate of the deposits stood at £22,920,000. In 1877 it reached £32,000,000. Postal savings banks, strictly so called, began only during the year 1881. At the close of 1882 they had 210,712 depositors, with an aggregate deposit of £1,872,988 sterling; and on 31st December 1883 375,838 depositors, with an annual deposit of £3,097,765. A convention lately made between France and Belgium enables depositors in either country to transfer their accounts to the other free of charge.⁴ M. Auguste de Malarce has greatly distinguished himself in the promotion of savings banks of all kinds, and most especially in urging the formation of penny banks and school banks. These, however, are not directly connected with the postal service.

The union of the telegraph with the post-office dates only from 1878. Prior to the amalgamation the number of telegraph offices was 4561; in 1883 it was already increased to 6448. At the former date (1878) the lineal extent of the telegraphs was 57,090 kilometres (35,453 miles); it is now (1885) upwards of 87,000 (54,027 miles). The postal administration having begun its new work by obtaining a credit for further extensions and for plant, amounting to nearly £100,000, the tariff was reduced (21st March 1878) to one half-penny for each word, with a minimum charge of 5d.⁵ In April 1884 France had 5535 subscribers to postal telephonic exchanges (against about 4000 in all Germany at the same date, according to the *Revue des Postes*), working under post-office licences of five years' duration, and paying (as in Great Britain) a royalty of 10 per cent. The postal telephonic system began in 1879. Up to the close of 1883 the royalties had produced £17,324. At Rheims, Troyes, Roubaix, Tourcoing, and St Quentin the post-office has its own exchanges. The aggregate number of inland postal money orders issued in France in 1881 was 14,626,117. In 1882 the number of inland orders increased to 15,791,774 (value £19,655,117), in 1883 to 16,808,627 (value £20,770,078). As compared with the population, the figures for 1883 show an average of 45½ to every

100 inhabitants, the corresponding figure for England being 70½, for the United States 17½, and for Italy 14½. The French parcel post forwarded in 1883 11,494,072 inland parcels, and 944,795 parcels abroad. A word must be added upon a special feature of the French post-office. Many years ago it began to collect books upon postal subjects; but up to 1878 it had less than 900 volumes, and less than 200 visits to consult them were made in a year. In 1884 there were about 8000 volumes—postal, telegraphic, statistical—and the annual visits for consulting them averaged 2500. These books are made accessible to the general public as well as to the postal staff, five rooms being set apart for the books, periodicals, and readers.

On the whole, it may be said that the recent record of the French postal service is a very honourable record, giving good augury of further improvements to come. Nor is it one of the least honourable items in that record to observe that, when the minister proposed to the chamber of deputies⁶ in 1877 an increased vote of £18,200 for the better remuneration of the rural letter-carriers, the chamber voted £69,600 instead.

AUSTRIA-HUNGARY, GERMANY, AND ITALY.

1. *Austria-Hungary.*—The Austrian postal system is amongst Austria's oldest on record. Vienna, too, possessed a local letter post and Hungary a parcel post, on the plan of prepayment, as early as May 1772, at which date no city in Germany possessed the like. Curiously enough, this local post was established by a Frenchman (M. Hardy) and managed by a Dutchman (Schooten).⁷ Thirteen years after its organization it became merged in the imperial post. The separate postal organizations of the empire (Austria) and of the kingdom (Hungary) date from 1867. In Austria the post-office and the telegraph-office are placed under the control of the minister of commerce, in Hungary under that of the minister of public works. In Austria the department has twenty-one travelling post-offices; in Hungary it has ten such.⁸ Within the limits of the whole Austrian empire the lineal extent of the postal telegraph lines was 20,875 English miles in 1877, and in 1883 32,380 miles. The total number of telegraph stations was 3958. The aggregate number of telegraphic messages in 1877 (Austria-Hungary) was 5,358,544, in 1883 9,974,993. The aggregate of mailed articles in Austria⁹ was 257,352,270 in 1877, and in 1878 358,427,000. Deducting from these figures the number of newspapers, book-packets, and parcels, there remains for letters and cards, jointly, an aggregate of 233,801,870 in 1877, and of 232,867,000 in 1878. In 1880 the letters and cards were 245,660,700, in 1881 255,618,100. In Hungary¹⁰ the aggregate of letters and post-cards was 61,064,856 in 1877, in 1878 59,612,000, in 1880 78,080,804, in 1881 82,592,040. The gross revenue from posts and telegraphs stood thus in 1882 (according to the financial estimates for that year): Austria £2,307,800, Hungary £2,128,065, total £4,435,865, of which sum the postal revenue proper (i.e., letter and parcel services) supplied about two and a half millions. In 1883 the gross revenue of Austria was £2,002,073; that of Hungary was £790,839; in the same year the respective expenditures were £1,647,373 and £605,185. In November 1881 a collecting service for bills and invoices was organized. In January 1883 the unit of weight for inland letters was increased from half an ounce to two-thirds of an ounce, the rate being 1d.; and in June of the same year the collection service above-named was made international between Austria-Hungary and the German empire, on the basis of the country of origin retaining all fees, and the country of payment remitting all sums collected by money orders at the usual rate of commission.¹¹ In 1882 and 1883 the chief postal statistics of both divisions of the empire were as follows¹² (Table XXI.):—

	Austria.		Hungary.	
	1882.	1883.	1882.	1883.
Inland letters	190,737,600	203,865,000	69,894,508	72,522,385
Inland post-cards	43,826,800	48,613,700	16,478,170	18,037,372
Foreign letters sent	31,084,900	33,337,300	1,406,574	1,580,094
Foreign post-cards sent ..	4,113,100	4,530,400	153,206	149,742
Totals	269,762,400	290,373,000	87,982,548	92,290,048

Ger-
many.

2. *German Empire.*—The Prussian postal system—now developed (mainly by the ability and energy of Dr Stephan, to whom the organization of the International Postal Union is so largely indebted) into the admirably organized post and telegraph office of the empire—began with the Great Elector, and with the establishment in 1646 of a Government post from Cleves to Memel. Frederick II. largely extended it, and by his successor the laws relating to it were consolidated. In Strasburg a messenger code existed as early as 1443. A postal service was organized at Nuremberg in 1570. In 1803 the rights in the indemnity-lands (*Entschädigungsländer*) of the counts of Taxis as hereditary imperial postmasters were abolished. The first mail steam-packet was built in 1821; the first transmission of mails by railway was in 1847; the beginning of the postal administration of the telegraphs was in 1849; and, by the treaty of postal union with Austria, not only was the basis of the existing system of the posts and telegraphs of Germany fully laid but the germ was virtually set of that International Postal Union which is now become so widely fruitful. That pregnant treaty was made for ten years on 6th April 1850, and was immediately accepted by Bavaria. It came into full operation on the 1st July following, and then included Saxony, Mecklenburg-Strelitz, and Holstein. Other German states followed; and the treaty was renewed in August 1860.

Between 1850 and 1860 the number of post-offices in Prussia increased by 20½ per cent., that of letters conveyed by 115 per cent. The postal staff during that term increased from 9029 to 15,471. In 1860 the aggregate number of letters was 135,377,086, that of ordinary parcels 13,765,836, that of registered parcels, with value declared (£178,937,360), 10,807,293.² In 1872 the post-offices of the empire, exclusive of those in Bavaria and Würtemberg (each of which countries retains in postal and telegraphic matters its own organization), numbered 5784, in 1883 11,646. Adding the number of letter-boxes, the total of postal receptacles in those years respectively was 33,362 and 65,175.³ The aggregate postal staff was 49,945 persons in 1872, in 1883 74,898.⁴ These figures include large numbers of persons who are connected with the transit of travellers, as well as with that of letters, parcels, and telegraphic messages. In 1872 the aggregate number of letters, cards, book-packets, and newspapers conveyed was 718,233,000, in 1883 1,468,315,000, or, with the addition of Bavaria and Würtemberg, 1,649,845,000.

For Berlin itself a private letter and parcel post was established by the commercial guild of the grocers and druggists in September 1800, and continued to work under their rule until 1806, when it was abolished. A regular delivery by letter-carriers, attached to the state postal organization, existed in Berlin as early as 1712.⁵ In 1876 the Berlin office employed a special staff of 3705 persons, which in 1883 had increased to 6120. It delivered in 1883 postal articles amounting to 199,500,000 in number. It received an annual income for postage of £796,517 in 1883.

The nett revenue accruing from the whole of the imperial postal and telegraphic service in 1874 was only £349,301 sterling;⁶ in 1881 it was £1,060,310 sterling, in 1882 £1,066,860, and in 1883 £1,172,343. The lineal extent of telegraphic lines in the whole of Germany was 74,313 kilometres (46,148 miles) at the close of 1882 as compared with 72,577 kilometres (45,070 miles) in the preceding year. There were 10,803 telegraphic offices (10,308 in preceding year). The aggregate number of messages transmitted in 1883 was 15,300,816 as against 12,721,290 in 1879. Collectively, the total number of money orders issued by the postal service throughout the German empire in 1882 was 52,537,440, showing an annual average a little exceeding one to each inhabitant; in 1883 53,935,556 money orders, worth a total of £161,622,221, were issued. In 1883 the aggregate number of ordinary inland parcels forwarded by the German parcel post was 79,245,700, that of registered parcels with declared value was 5,410,800, the aggregate declared value being £201,469,460. The parcels sent abroad were—ordinary 3,231,970, registered with declaration of value 262,620.

3. *Italy.*—The history of the Italian post-office is in many Italy respects one of special interest. But the limits of this article admit only of a very brief statement of results. Its origin may be traced virtually to Venice and to the establishment of the "Corrieri di Venezia" early in the 16th century. As early as 1818 the Sardinian post-office issued stamped letter-paper. The total number of letters, newspapers, and book-packets conveyed in 1862 was but 111,733,319. Ten years later there was an aggregate of 232,242,677, and in 1882 one of 333,242,148. The comparative growth of postal traffic in letters and post-cards may be shown thus: in 1869 the aggregate number was 37,613,348, in 1870 89,430,261, in 1880 189,207,627, in 1881 194,587,021, in 1882 204,644,355,⁷ in 1883 216,944,382.

The growth of postal savings banks in Italy is on the whole satisfactory, as will be seen by a glance at the following table (XXII.) :—

	No. of Banks.	No. of Accounts (31st Dec.)	Amount of Deposits (31st Dec.)
1876	1989	57,354	£97,786
1879	3259	238,869	1,049,391
1881	3406	471,094	2,679,876
1882	3488	592,018	3,398,049
1883	3584	805,988	4,485,185

In the year 1881 the accounts opened were 143,410 and 249,741 in 1883; those closed were 12,161 in 1881 and 35,771 in 1883. The average of each deposit increased (omitting fractions) from £1, 4s. 3d. in 1876 to £3, 16s. 1d. in 1881, and decreased to £3, 4s. 8d. in 1883. The average sum standing to the credit of each depositor was £5, 12s. 11d. in 1881 and in 1883 £5, 11s. 3d. The number of accounts opened in 1883 was 249,741 as against 144,485 opened in 1882. This rapid increase, and the corresponding diminution in the average amount of each deposit and of the average sum standing to the credit of each depositor, are due to the regulation of 18th February 1883, which came into operation on 1st May following, and by which post-office savings banks were authorized to accept as deposits cards bearing sufficient ten-centime postage stamps to make up the sum of one lira (93d.). Between 1st May and 31st December 193,763 such cards were deposited. The financial results of the post-office savings banks service for 1883 show a nett gain of £29,768; the total gain from 1876 to 1883 was £90,345. It is the purpose of the postal administration to make by degrees the number of the postal savings banks identical with that of the post-offices.⁸ That administration is now (1885) a dependency upon the ministry of public works. There were issued in 1883 for Italy itself 4,207,544 money orders, valued at £21,706,968, and for countries abroad 17,087, valued at £164,174.

The Italian parcel post despatched in the first three months of 1882 489,687 articles, in the corresponding period of 1883 869,280; it received respectively 486,814 (1882) and 978,559 (1883).⁹ The number of parcels, both inland and foreign, conveyed in 1882 was 2,877,201. In 1883 3,747,182 inland and 180,828 foreign parcels were despatched by parcel post. The nett postal revenue in 1882 was £197,257 (against £152,676 in 1881), to which sum the parcel post contributed £27,078.¹⁰ The nett postal revenue in 1883 was £213,537. The parcel post of Italy dates only from 1881 (October), since which time it has carried more than nine millions of parcels, which it registers, paying for loss or damage during transit. But the service is so excellently organized that the administration has hitherto (1885) had to pay but a very insignificant sum as compensation.

POSTAL CONGRESSES AND INTERNATIONAL POSTAL UNION AT BERN.

Substantially, the first step towards an effectual postal Conference was taken at Paris in June 1863, when delegates came of from France, Great Britain, Austria, Prussia, Italy, Spain, Belgium, Holland, Portugal, Switzerland, Denmark, the Hanseatic towns, the United States of America, and Costa Rica met in congress, under the presidency of M. Vandal, the then postmaster-general of France. The conference recommended (1) an optional prepayment of foreign letters, with a reduction of the differential charge between paid and unpaid; (2) a readjustment of the regulations concerning the international weighing and taxing of letters; (3) a

reduction of the transit tariff;¹ (4) an improved regulation as to the choice of routes of transit for letters addressed to remote parts of the world; and (5) great improvements in the international money-order system, and in the postal transmission of articles of special value.² Thus a basis was practically laid for the treaty of Bern of 1874. What was achieved in 1874 and extended in 1878 had also been largely promoted by the proceedings and example of several local conferences on postal affairs held at various dates in Germany. Certain intermediate international conferences, more or less largely constituted, also helped to prepare the way for the great results of 1874. Though here necessarily limited to brief notices of the treaty of Bern and of the congress at Paris (four years later), a word or two must be afforded to a curious anticipation by an enterprising Swiss of a social reform destined to be realized at a distance of almost two centuries. Amongst the many political schemes which the dread of the advance of France towards a predominating sway in Europe gave rise in the 17th century was that of Beatus Fischer, who strove zealously to seat at Bern a postal union—representing Austria, the empire, the electorate of Brandenburg, Great Britain, the Netherlands, Italy, Spain, and Switzerland—which should organize and administer a great network of postal routes, independently of France.³ But France was still too strong, and the incidental difficulties too great. The attempt, however, led to minor postal reforms in various places.

Treaty
of Bern.

At Bern in 1874 postal delegates of twenty-two states assembled, representing an aggregate population of 350 millions. An eminent Frenchman had given a great impulse to the initiatory movement in 1863; a Belgian (M. Vincent) and a Prussian (Dr Stephan) were the principal leaders of its development in 1874.⁴ Both had already rendered distinguished service to their respective countries. A half-ounce unit of weight for ordinary letters; a uniform charge, wholly irrespective of distance, of 2½d. for a letter from any one country within the Union to any other; uniform rates for newspapers (1d. for 4 oz.) and for book-parcels, law-papers, mercantile samples (1d. for every 2 oz.); a transit rate greatly reduced; a regulation (very fruitful in good results) that "each post-office shall retain its own collections, and that payments due for transit shall be estimated only from accounts taken twice in each year," were among the chief improvements effected. M. Vincent (17th September 1874)⁵ suggested the creation of an international board; and the proposal met with the zealous support of Dr Stephan, of Dr William Günther (whose death in December 1882 was a great loss to the post-office of Germany), and of other leaders of the conference. The office so established is supported by contributions, graduated roughly—not merely according to extent of postal traffic but in part according to national rank—from the several administrations. There are six classes of such contributions. Each country in the first class contributes 25 parts of the total expense, each of the second class 20 parts, of the third 15, of the fourth 10, of the fifth 5, and of the sixth 3 parts. It is covenanted that the total

expense shall not exceed £3000 a year. No rule was laid down as to the composition of the board. But the persons entrusted wisely determined that "it should be international in composition as in attributions." All its proceedings are reported in its official organ, *L'Union Postale*, which is trilingual (German, French, English) and appears monthly. Dr Stephan did not err by over-enthusiasm when he said at the close of the proceedings, "You enter upon one of the most important fields of action in the intercourse of nations; . . . you are promoting an eminent work for their peace and their prosperity." The work so successfully begun at Bern was extended at Paris, when from representing twenty-two states the Union came to represent thirty-three, and the 350 millions of (in a certain sense) its "constituents" had grown to 653 millions.

The work before the convention at Paris in June 1878 consisted mainly in the application of four years' experience, in the postal administrations of the constituent states, to the improvement of details. It made improved regulations with respect to transit between countries within the Union and those which still remained outside of it. It guaranteed rights of transit throughout the entire Union. It extended stipulations, made at Bern, to postal exchanges between members of the Union and extraneous countries, in cases wherein the postal service of two at least of the contracting countries were employed. It provided that expenses of transit should be borne by the country of origin. In some cases it slightly enhanced the unit of charge whilst considerably extending the unit of weight. It made valuable improvements in the regulations concerning compensations for loss during transit. Finally, it made provision for a postal congress to revise and to improve all pending rules and matters at least once in every five years.⁶ The last congress was held at Lisbon in February 1885. One of the matters which claimed its attention calls imperatively for some notice here. Whilst the growing action of the Postal Union tends constantly to simplification and identity of postal systems, there still exists great diversity of national practice and of national law on the important point of the ownership of a letter whilst in transit. In Great Britain it lies, for the time being, in the queen, as represented by her postmaster-general and her secretary of state. Neither sender nor addressee can claim to interfere with a letter whilst in the post-office. Only the warrant of a secretary of state can stay its delivery. In Her Majesty's Indian empire, however, the sender has virtually a property in the letter until delivery, and may (under regulations) recall it. So is it in Belgium, in Austria and Hungary, in Portugal, in Russia, and in the Scandinavian states, whilst in Canada the letter belongs to its addressee as soon as it is posted. In the Netherlands there is no precise law, but the sender may claim return prior to actual postal despatch; the case is virtually similar in France. In Italy, in Spain, and in Greece the addressee (as in Canada) has an absolute property in the letter when once posted.⁷ A very recent decision of the French council of state extends the French provision,⁸ practically, in favour of the sender up to actual delivery, leaving it to the postal administration to regulate the forms.

Convention at
Paris, 1878.

Congress at
Lisbon, 1885.

Subjoined is a tabular view (Table XXIII.) of postal statistics of the principal countries comprised within the Postal Union for the year 1883.

¹ All the envoys, the Italian envoy excepted, advocated such a tariff as should leave some surplus, by way of reserve fund, for improvements in the services. And in 1863 adherence to a distance-scale, albeit a liberal one, obtained favour universally.

² Various contemporary reports in periodicals; Schmid, "Der deutsche Briefporto-Tarif," &c. in *Jahrbücher*, ii. 187-205.

³ The details are given in *L'Union Postale* (of August 1883), viii. 190.

⁴ Full and able reports of the proceedings will be found in the preliminary numbers of *L'Union Postale*, October to December 1875, and additional particulars in later numbers. A good summary is given by M. Bonnaud, "Le Congrès Postal," &c., in *Journal des Economistes*, ser. 4, ii. 419 sq.

Portugal	18,247,577	34	4	2,467	126,321	10,908 [deficit]
Roumania	9,491,214	261	2	1,410	163,245	50,080
Russia	124,555,076	1829	1	15,865	2,508,323	230,600 [deficit]
Spain	101,111,070	74	6	7,112	685,706	383,269
Sweden	37,500,044	90	8	3,905	337,352	39,468
Switzerland	71,930,625	5	25	5,936	679,476	49,833
United States	88	..	69,020	9,610,393	443,569

The crowning improvement in postal matters, that of an international transit entirely free, is merely a question of time. It is the logical, the necessary complement of the work initiated at Paris in 1863, organized at Bern in 1874, revised and methodized again at Paris in 1878. One postal territory, one code of postal regulations, one uniform postal tariff, free conveyance between nation and nation, will be the outcome of this important movement.

Comparing the postal traffic of the various quarters of the globe for the year 1882 we find that out of a total of 8,280,000,000 articles mailed European countries claimed nearly two-thirds, while America had considerably more than one-fourth. The total was distributed as follows:—

Europe	5,624,000,000	Australia.....	73,000,000
America	2,366,000,000	Africa	12,000,000
Asia	205,000,000

POSTAGE STAMPS.

For all practical purposes the history of postage stamps begins in the United Kingdom, and with the great reform of its postal system in 1839-40. A post-paid envelope was in common use in Paris in the year 1653. Stamped postal letter-paper (*carta postale bollata*) was issued to the public by the Government of the Sardinian states in November 1818 (above, p. 583), and stamped postal envelopes were issued by the same Government from 1820 until 1836.⁴ Stamped wrappers for newspapers were made experimentally in London by Mr Charles Whiting, under the name of "go-frees," in 1830. Four years later (June 1834), and in ignorance of what Mr Whiting had already done, Mr Charles Knight, the well-known publisher, in a letter addressed to Lord Althorp,

then chancellor of the exchequer, recommended similar wrappers for adoption. Finally, and in its results most important of all, the adhesive stamp was made experimentally by Mr James Chalmers in his printing-office at Dundee in August 1834.⁵ These experimental stamps were printed from ordinary type, and were made adhesive by a wash of gum. Their inventor had already won local distinction in matters of postal reform by his strenuous and successful efforts, made as early as the year 1822, for the acceleration of the Scottish mails from London. Those efforts resulted in a saving of forty-eight hours on the double mail journey, and were highly appreciated in Scotland. There is evidence that from 1822 onwards his attention was much directed towards postal questions, and that he held correspondence with the postal reformers of his day, both in and out of parliament. It is also plain that he was far more intent upon aiding public improvements than upon winning credit for them. He made adhesive stamps in 1834, and showed them to his neighbours, but took no step for publicly recommending their adoption by the post-office until long after such a recommendation had been published—although very hesitatingly—by the author of the now famous pamphlet, entitled *Post-Office Reform*.⁶ Mr Hill brought the adhesive stamp under the notice of the commissioners of post-office inquiry on 13th February 1837. Mr Chalmers made no public mention of his stamp of 1834 until November 1837.

Only a fortnight before his examination by the above-named commissioners Mr Hill, in his letter to Lord Montague (then Mr Spring Rice and chancellor of the exchequer), seemed to have no thought of the adhesive stamp. He recommended to the treasury that "stamped covers and sheets of paper be supplied to the public from the stamp-office, or post-office, . . . and sold at such a price as to include the postage. . . . Covers at various prices would be required for packets of various weights. Each should have the weight it is entitled to carry legally printed with the stamp. . . . Should experience warrant the Government in making the use of stamped covers universal,⁷ most important advantages would be secured. The post-office would be relieved altogether from the collection of the revenue."⁸ Then, upon suggestion, it would seem, of some possible difficulty that might arise from the occasional bringing of unstamped letters to a post-office by persons unable to write, he added: "Perhaps this difficulty might be obviated by using a bit of paper just large enough to bear the stamp, and covered at the back with a glutinous wash." It may perhaps be inferred that this alternative had been suggested from without. In reviewing the subject, long afterwards, in his *History of Penny Postage*, Sir R. Hill says: "The post-office opinions as to the use of stamps for . . . prepayment were, on the whole, favourable." In a paper of 1839, entitled *On the Collection of Postage by means of Stamps*, the author continued to look upon "stamped covers or envelopes as the means which the public would most commonly employ; still believing that the adhesive stamp would be reserved for exceptional

⁵ Patrick Chalmers, *Sir Rowland Hill and James Chalmers, Inventor of the Adhesive Stamp* (London, 1882), *passim*. See also the same writer's pamphlet, entitled *The Position of Sir Rowland Hill made plain* (1882), and his *The Adhesive Stamp: a Fresh Chapter in the History of Post-Office Reform* (1881). Compare Mr Pearson Hill's tract, *A Paper on Postage Stamps*, in reply to Mr Chalmers, reprinted from the *Philatelic Record* of November 1881. Mr Hill has therein shown conclusively the priority of publication by Sir Rowland Hill. He has also given proof of Mr James Chalmers's express acknowledgment of that priority. But he has not weakened the evidence of the priority of invention by Mr Chalmers.

⁶ *Ninth Report of Commissioners of Post-Office Inquiry*, 1837, pp. 32, 33, reprinted in Sir R. Hill's "History of Penny Postage" (*Life*, &c., ii. 270).

Manu-
facture of
stamps.

cases."¹ Mulready's well-remembered allegorical cover came into use on 1st May 1840, together with the first form of the stamped letter-paper, and the adhesive labels.² They all met at first, but only for a few days, with a large sale. That of the first day yielded £2500. Soon afterwards the public rejection of the "Mulready envelope," writes Rowland Hill, "was so complete as to necessitate the destruction of nearly all the vast number prepared for issue." Whilst, on the other hand, the presses of the stamp-office were producing more than half a million of [adhesive] labels, by working both night and day, they yet failed to meet the demand."³ It was only after many weeks, and after the introduction of a series of mechanical improvements and new processes, due to the skill and ingenuity, in part of Mr Edwin Hill of the stamp-office, in part of Mr Perkins, an engraver, that the demand could be effectually answered. To find an obliterating ink which worked effectually, without damaging the letters, was also a special difficulty.

In the production of the stamps both cheapness and security against forgery had to be combined. "The queen's head was first engraved on a single matrix, the effigy being encompassed with lines too fine for any . . . but the most delicate machinery to engrave. The matrix, being subsequently hardened, was employed to produce impressions on a soft steel roller of sufficient circumference to receive twelve, and this, being hardened in turn, was used under very heavy pressure to produce and repeat its counterpart on a steel plate,"⁴ capable of working off, at each impression, 240 stamps. Engravers, printers, chemists, and artificers of several kinds had to combine their efforts before the desired results could be secured. Long afterwards (June 1856) a question was raised in the House of Commons as to an alleged preference of one manufacturing firm over all its virtual competitors without preliminary inquiry or actual competition. The operation, it was replied, was confided to Messrs De La Rue & Co., because they "had the best means of accomplishing it (*i.e.*, the production of the adhesive stamp) within the time required. No public notice calling for tenders for printing and gumming was given to the trade, nor is there any trade to which such notice could have been given, the operation being the making of the stamps, as well as the printing and gumming, and that operation being to a great extent experimental."⁵ The total cost of the manufacture of each million of stamps was £30, 0s. 11d. (*viz.*, paper, £5, 14s. 5d.; printing and gumming, £22, 1s. 9d.; perforating,⁶ £1, 8s. 1d.; salaries, 16s. 8d.). To this is to be added a sum of £45, 2s. 4d. for poundage and commission upon the sale, making in all £75, 3s. 3d., the whole of which forms a deduction from the produce of sale. In the event about three thousand millions of stamps were produced from the original matrix. At the end of fifteen years a second matrix was obtained, after the deepening of the lines by hand, from the first. From 1st May 1840 up to the end of the year 1884 more than thirty-one thousand three hundred millions of postage stamps had been printed,

varying in value from £5 to a halfpenny. The details are as follows (Table XXIV.):—

Adhesive stamps at £5	84,000

Total number.....	31,301,885,334

The first contract for the ordinary stamped envelope, stamped with the embossed queen's head, was entered into with Messrs Dickinson & Longman on 22d May 1840. The average cost of each million of this envelope was £376; of which sum £359, 6s. was repaid by the produce of its sale, over and above the value of the stamp, leaving a nett deduction from the aggregate value of £16, 14s. upon each million sold.⁷ In November 1850 a second contract was entered into with Messrs De La Rue & Co., afterwards contractors for the adhesive stamp. From 1847 to 1856 inclusive the aggregate number of envelopes manufactured and sold was 186,124,000. Under both these contracts the outside of the envelope was impressed with a coloured embossed device in the place of a seal.⁸ And this small device—the cost of which was infinitesimal—whilst it obviously improved the appearance of the envelope, added still more to its security. Of late years the device has been omitted, and the security of letters impaired for a very contemptible saving.

The little canton of Zurich was the first foreign state to adopt postage stamps, in 1843. The stamps reached America in the same year, being introduced by the Government of Brazil. That of the United States did not adopt them until 1847; but a tentative issue was made by the post-office of New York in 1845. An adhesive stamp was also issued at St Louis in the same year, and in Rhode Island in the next. In Europe the Swiss cantons of Geneva (1844) and of Basel (1845) soon followed the example set by Zurich.⁹ In the Russian empire the use of postage stamps became general in 1848 (after preliminary issues at St Petersburg and in Finland in 1845). France issued them in 1849.¹⁰ The same year witnessed their

⁷ This great difference of the deduction from the postal revenue accruing from the nett produce of stamped envelopes of only £16, 14s. upon each million sold, as against £75, 3s. upon each million of the labels, may well have weighed much with Sir Rowland Hill in his long preference for stamped covers to adhesive labels. If the 23,415 millions of adhesives sold up to 1879 could have been sold in the form of envelopes the gain to the revenue would have been more than £1,358,070. Besides, the security of the cover is greater.

⁸ *Return*, &c., as above (Sessional Paper of 1856, No. 392, p. 8).

⁹ On the whole, within the course of seven years the postage stamp was adopted in three Swiss cantons, throughout the United States, in Russia, and in Brazil. So curiously inexact is the statement which appears in Mr Lewin's volume—one in many respects of eminent ability—entitled *Her Majesty's Mails*, p. 261: "For eight long years the English people may be said to have enjoyed a complete monopoly in postage stamps." It is still more curious to observe in Sir Rowland Hill's own "History of Penny Postage" (*Life*, &c., ii. 13) this passage: "It is remarkable . . . that the first countries to adopt the improvement—Spain and Russia—should be two so far from taking a general lead in civilization."

¹⁰ The date of the law authorizing the introduction is 30th August 1848. It became operative on 1st January 1849.

¹ "History of Penny Postage" (*Life*, i. 345, 346).

² "Considerable diversion was created in the city to-day [1st May 1840] by the appearance of the new penny-post devices for envelopes, half-sheet letters, and bits of sticking-plaster for dabbing on to letters. . . . [The elephants on the Mulready cover] are symbolic of the lightness and rapidity with which Mr Rowland Hill's penny-post is to be carried on. . . . Withal the citizens are rude enough to believe that these graphic embellishments will not go down at the price of 1s. 8d. per dozen for the envelopes, . . . and of 1s. 1d. per dozen for the . . . sticking-plaster." This good-humoured banter is from the money article of an eminent daily paper.

⁶ This item only after the year 1853.

introduction into Tuscany, Belgium, and Bavaria, and also into New South Wales. Austria, Prussia, Saxony, Spain, Italy, followed in 1850. The use of postage stamps seems to have extended to the Sandwich Islands (1851?) a year before it reached the Dutch Netherlands (1852). Within twenty-five years of the first issue of a postage stamp in London, the known varieties, issued in all parts of the world, amounted to 1391. Of these 841 were of European origin, 333 were American, 59 Asiatic, 55 African. The varieties of stamp issued in the several countries of Oceania were 103. Of the whole 1391 stamps no less than 811 were already obsolete in 1865, leaving 580 still in currency.

It was not until 1853 that the admirable improvement of perforating the stamp-sheets was introduced by the purchase for £4000 (pursuant to the recommendation of a select committee of the House of Commons of 1852) of a perforating machine invented by Mr Henry Archer. Other improvements of value have also been made in the obliterating process. The defacement mark now serves to show the official consecutive numbers of the town in which each particular letter was posted. For England that number appears within circular lines; for Scotland, between parallel lines; for Ireland, it appears diamond-wise. The general post-office mark also denotes the hour of posting. The metropolitan district marks indicate the office number within oval lines under the initials of each district. Paper for the embossed stamps of all the recognized values is received by the Board of Inland Revenue from all persons who offer it, under favourable regulations.

The collection and sale of specimen postage stamps as a branch of commerce has already attained dimensions little anticipated by those who watched the origin of the new pursuit, as a sort of toy for children, some quarter of a century ago. Before stamp-collection became conspicuous commercially, it came to have a recognized educational value, in its degree, as an amusing aid to the early knowledge of geography, more especially in the political aspect.

When the legislation of August 1848 directed the introduction of postage stamps into France the first endeavour of the postal administration was to make a contract for their manufacture in England. But the terms proposed were thought to be too high. A contract was then made with M. Hulot of the Paris mint, and the die approved of was engraved by M. Barre, also of that establishment. M. Hulot became "director of the manufacture of postage stamps," and under the early contracts was allowed, in lieu of salary, one franc (10d.) on each thousand stamps for the first two hundred millions, 9d. per thousand for the next two hundred millions, and 8d. per thousand for all above. In 1869 these terms were reduced to 6d. per thousand upon the first five hundred millions, and 5d. upon all above.¹ The cost of mere manufacture was slightly below that of the stamps of the United Kingdom, each million being estimated to cost about £25, 10s., of which sum paper, printing, and gumming absorbed somewhat more than £20.²

During the war, in November 1870, a contract was entered into between the Provisional Government and a M. Delebecque and others for the manufacture of postage stamps at Bordeaux. The contractor bound himself to deliver, after a day determined, 4000 sheets of stamps daily, each containing 300 stamps, at the price of 8d. for each sheet. The stamps were to be of the several values of 8d., 4d., 3d., 2d., 1d., ½d., and of one, two, three, and four centimes respectively, in such proportions as the post-office should direct. The first plate which was sent to the press was made from a matrix drawn with the pen; afterwards lithographic processes were employed. The post-office suspended the contract by notice in March 1871, but was immediately obliged by the communal insurrection to license its continuance, and the manufacture was resumed at Bordeaux until June. On the whole, 125,387,075 postage stamps were produced from the presses at Bordeaux.³

The first postage stamp used in Germany was issued in the kingdom of Bavaria in 1849. It is of quite inartistic character, though originating in a state so famous for its cultivation of the plastic arts. The earliest type shows with the name of the country only the postal tariff. None of the many subsequent varieties displays the royal effigy; even the embossed royal arms were not used until

1866. Stamps made specially for the use of the army bear the figure sometimes of a Bavarian trooper, sometimes of an infantryman or artilleryman. The earliest Prussian stamp is of November 1850, and bears the effigy—laureated—of the King, in filigree, to which in 1861 succeeded the Prussian eagle. The duchy of Anhalt and several petty principalities placed themselves under its wing by adopting almost from the outset the Prussian stamp. Three weeks after its first appearance in Prussia, Hanover (December 1850) issued a stamp bearing the name of the kingdom with the royal arms. The first stamp having the royal effigy is an envelope of 1857. The effigy appears first upon adhesive stamps in 1859. The earliest Saxon type (1850) shows merely the postal tariff, but the second, of the same year, bears the king's head. The first Baden stamp resembles that of Saxony. The head of the grand-duke appears upon an envelope of October 1858. From 1860 the adhesives bear the arms of the duchy. Within the Thurn and Taxis district stamps were first used in 1852, and they continued until 1866. The earliest stamp of Schleswig-Holstein is that of an insurrectional Government patronized by Prussia and bears the national arms. The insignia of Denmark take their place in 1852 and continue until 1864. In that year separate stamps appear for Schleswig and for Holstein, to be succeeded for a short time by a common one in 1865.

In January 1868 the postage stamps of Prussia, Hanover, Saxony, Oldenburg, of the two Mecklenburgs, of Brunswick, of Schleswig-Holstein, and of the free cities of Bremen, Hamburg, and Lübeck virtually disappear and are replaced by the new stamp of the North German Confederation. For a while the postage envelopes of such of those states as had issued any continued to appear, but with the significant super-addition of the confederation stamp. That, in its turn, after a currency of nearly four years, made room (15th December 1871) for the imperial stamp of the new Germany. The grand-duke of Baden presently adopted it. Only Bavaria and Württemberg retain their special postage stamps and their separate administration. Certain tariff stamps, however, for merely fiscal purposes continue to be used in Saxony, Saxe-Coburg-Gotha, Brunswick, Oldenburg, Hesse, Mecklenburg-Schwerin, Schaumburg-Lippe, Schwarzburg-Sondershausen, and in the city of Bremen.⁴

This brief review of philatelic phenomena in Germany—the limits of this article make it impossible to give similar details for the rest of Europe—may suffice to show that the pretension of stamp-collectors to illustrate, in degree, the course and currents of political geography has its justification in fact.

The earliest postage stamps of Austria-Hungary date from 1850, in Austria and display the imperial arms. It is only in 1858 that the emperor's triad takes their place. In 1863 and 1864 the armorial eagle Hungary reappears, followed again and continuously, as regards adhesive stamps, by the imperial effigy. The stamped wrappers for newspapers and books bear sometimes a figure of Mercury, sometimes the double-headed eagle. Stamped envelopes were first issued in 1861; they bear, indifferently, the imperial effigy or the armorial eagle. The imperial stamps are adopted in the principality of Liechtenstein. The special stamps for Hungary bear date from 1868. The postal card is of Austrian origin, and was first issued in August 1869. Taking all kinds of postal stamps together, the aggregate number of types (39) and of varieties (123) issued throughout the empire from 1850 amounted in 1883 to 162.⁵

In the Russian empire the province of Finland takes the initiative. As early as 1845 its lion within a crowned escutcheon appears upon a postal envelope. Its adhesive stamps (1856) date a few months earlier than the earliest formalized issue for the empire generally (1857). These Finnish stamps are of similar type to the envelopes, but they continue to bear the arms of the province only until 1860. The Russian stamps bear the imperial eagle and the imperial crown; but none of them bears the head of the emperor. For a short time (1858-1864) unhappy Poland has the appearance—it is little more—of a certain differentiation in the stamps issued at Warsaw from those of the empire at large. But early in 1865 these slight peculiarities disappear, along with the local postal administration of Warsaw. All the Polish stamps are now obsolete, and have been superseded by those of the Russian empire.⁶ Many other local posts, however, survive in all parts of the empire; and their stamps have peculiarities which are eminently curious. Some bear the arms, as in the case of Finland, of a province or of a great town. Others, and the greater part, bear symbolic and curious emblems: at Kherson, a wheat-sheaf, a scythe, and a rake; at Elizabethgrad, an open book, sheaves, a scythe, and a plume of feathers interlaced; at Tamboff, a beehive; at Bogorodsk, Saint George on horseback. The varieties of Russian local stamps are so great, and some of them so scarce, as to cause to the ardent

Defacement
marks.

collector many a heartache. M. Koprowski has of late come to his solace by devoting a volume to their history. Stamp-collecting has for some years past possessed a literature large enough to fill a respectable bookcase; it bids fair ere long to need a large library for its storage. Of Russian stamps, general and local together, the total number of types exceeded 135 up to the year 1875.

The table (XXV.) which follows will give the reader the chronological sequence of postage-stamps in all parts of the world.

Year.	Countries.	Year.	Countries.
1840	United Kingdom.	1852	Roman States, Parma, Modena, Brunswick, Thurn and Taxis post-district, Netherlands, Luxemburg, Isle of Réunion.
1843	Zurich, Brazil.	1853	Portugal, Cape of Good Hope, Tasmania.
1844	Geneva.	1854	Norway, British India, Philippines, West Australia.
1845	Basel, St Petersburg (experimental), Finland (envelopes), New York ¹ (tentatively), St Louis.	1855	Sweden, Bremen, Cuba, Porto Rico, South Australia, New Zealand.
1846	Rhode Island.	1856	Mecklenburg-Schwerin, Finland (adhesives), Uruguay.
1847	United States, Mauritius (?), ²	1857	Lübeck (?), ³ Ionian Isles, Roumania, Russia (adhesive stamps), Mexico, New Brunswick, Newfoundland, Ceylon, St Helena, Natal.
1848	Russia (envelopes). ³	1858	Naples, Poland, Moldavia, Nova Scotia, Buenos Ayres, Argentine, Peru. ⁴
1849	France, Belgium, Bavaria, Vaud, Winterthur, Tuscany, ⁴ New South Wales.		
1850	Austrian empire, Italy, Prussia, Saxony, Schleswig-Holstein, Spain, Switzerland, Hanover, Baden (?), British Guiana (?), Victoria (?). ⁵		
1851	Baden, Wurtemberg, Denmark, Oldenburg, Canada, Trinidad, Chili, ⁶ Sind (tentatively), ⁷ Sandwich Islands (?).		

Year.	Countries.	Year.	Countries.
1859	Sicily, Romagna, Hamburg, St Lucia, Bahamas, New Granada, Venezuela.	1866	Servia, Honduras, Virgin Islands, Shanghai, Kashmir, Decan, Sarawak.
1860	Poland, Malta, Jamaica, Prince Edward Island, Dutch West Indies, Liberia, New Caledonia.	1867	Heligoland, St Salvador, Guadalupe, Bolivia, Malacca, South African Republic.
1861	Greece, Bergedorf, British Columbia, St Vincent, Nevis, Sierra Leone, Queensland.	1868	Azores, Madeira, Orange River, Fernando Po.
1862	Roumania, Livonia, San Domingo, Antigua, Nicaragua, Costa Rica, United States of Colombia.	1869	Gambia, St Thomas, Angola.
1863	Turkey, Turk's Islands	1870	St Christopher, Paraguay.
1864	Mecklenburg-Strelitz, Dutch East Indies.	1871	Guatemala, Japan.
1865	Vancouver, Bermuda, Egypt. ¹⁰	1872	Portuguese Indies, Persia, Fiji.
		1873	Iceland, Dutch Guiana, Curaçoa, Cabul.
		1874	Montenegro, Dominica, Lagos (Gold Coast).
		1875	Punjab.

The extent of the commercial traffic which has so rapidly grown stamp-collecting (sufficiently for our purposes) by a record of three facts: (1) the aggregate number of manuals, periodicals, and current catalogues relating thereto, in English, French, and German alone, exceeds seventy; (2) for a collection of postage stamps, made by Sir Daniel Cooper (of Australia) between 1862 and 1878, £3000 sterling was given in the last-named year by M. Philippe de Ferrari; (3) the Galliera collection at Paris is said, upon credible authority, to have cost, up to 1883, in acquisition and arrangement together no less a sum than £57,600 (1,440,000 francs). Next to these two collections ranks that of M. A. de Rothschild.¹¹ (E. ED.)

POTASSIUM METALS. Under this heading we treat of potassium, rubidium, and caesium; SODIUM and LITHIUM, being less closely allied to potassium, have special articles devoted to them.

Potassium.—The three metals under consideration are all very widely diffused throughout nature; but only potassium is at all abundant, and therefore we begin with it. The richest natural store is in the ocean, which, according to Boguslawski's calculation (in his *Océanographie*) of its total volume and the present writer's analysis of sea water, contains potassium equal to 1141 times 10^{12} tons of sulphate, K_2SO_4 . This inexhaustible store, however, is not much drawn upon at present; the "salt-gardens" on the coast of France have lost their industrial importance as potash-producers, if not otherwise, since the rich deposits at Stassfurt in Germany have come to be so largely worked. These deposits, in addition to common salt, include the following minerals:—sylvine, KCl ; carnallite, $KCl \cdot MgCl_2 \cdot 6H_2O$ (transparent deliquescent crystals, often red with diffused oxide of iron); kainite, $K_2SO_4 \cdot MgSO_4 \cdot MgCl_2 \cdot 6H_2O$ (hard crystalline masses, permanent in the air); kieserite (a hydrated sulphate of magnesia which is only very slowly dissolved by water); besides boracite, anhydrite ($CaSO_4$), and other minor components lying outside the subject of this article. The potassium minerals named are not confined to Stassfurt; far larger quantities of sylvine and kainite are met with in the salt-mines of Kalusz in the eastern Carpathian Mountains, but they have not yet come to be worked so extensively. The Stassfurt potassiferous minerals owe their industrial importance to their solubility in water and consequent ready amenability to chemical operations. In point of absolute mass they are insignificant compared with the abundance and variety of potassiferous silicates, which occur everywhere in the earth's crust; orthoclase (potash felspar) and potash mica may be quoted as prominent examples. Such potassiferous silicates

are found in almost all rocks, if not as normal at least as subsidiary components; and their disintegration furnishes, directly or indirectly, the soluble potassium salts which are found in all fertile soils. These salts are sucked up by the roots of plants, and by taking part in the process of nutrition are partly converted into oxalate, tartrate, and other organic salts, which, when the plants are burned, assume the form of carbonate, K_2CO_3 . It is a remarkable fact that, although in a given soil the soda may predominate largely over the potash salts, the plants growing in the soil take up the latter by preference: in the ashes of most land plants the potash (calculated as K_2O) forms upwards of 90 per cent. of the total alkali (K_2O or Na_2O).¹² The proposition holds, in its general sense, for sea plants likewise. In ocean water the ratio of soda (Na_2O) to potash (K_2O) is 100 : 3.23 (Dittmar); in kelp it is, on the average, 100 : 5.26 (Richardson). Ashes particularly rich in potash are those of burning nettles, wormwood (*Artemisia Absinthium*), tansy (*Tanacetum vulgare*), fumitory (*Fumaria officinalis*), tobacco. In fact the ashes of herbs generally are richer in potash than those of the trunks and branches of trees; yet, for obvious reasons, the latter are of greater industrial importance as sources of carbonate of potash.

Carbonate of Potash (K_2CO_3) in former times used to be made exclusively from wood-ashes, and even now the industry survives in Canada, Russia, Hungary, and other countries, where wood is used as the general fuel. In some places—for instance, in certain districts of Hungary—wood is burned expressly for the purpose; as a rule, however, the ashes produced in households form the raw material. The ashes are lixiviated with water, which dissolves all the carbonate of potash along with more or less of chloride, sulphate, and a little silicate, while the earthy phosphates and carbonates and other insoluble matters remain as a residue. The clarified solution is evaporated to dryness in iron basins and the residue calcined to burn away particles of charcoal and half-burned organic matter. In former times this calcination used to be effected in iron pots, whence the name "potashes" was given to the product; at present it is generally conducted in reverberatory furnaces on soles of cast-iron. The calcined product goes into commerce as crude potashes. The

⁹ Rothschild's date is 1857.

¹⁰ Gray (6th ed., p. 258). Both Rothschild and Earle give the date as 1866.

¹¹ See *Stamp-Collector's Magazine*, 1878.

¹² Compare the interesting paper by C. Bischoff in the *Journ. f. Pract. Chem.*, vol. xlvii. p. 193 (1849).

composition of this substance is very variable,—the percentage of real K_2CO_3 varying from 40 to 80 per cent. The following analysis of an American "potashes" is quoted as an example.

Carbonate of potash	...71.4	Water 4.5
" soda 2.3	Insoluble matter 2.7
Sulphate of potash14.4		
Chloride of potassium	... 3.6		98.9

Crude potashes is used for the manufacture of glass, and after being causticized for the making of soft soap. For many other purposes it is too impure and must be refined, which is done by treating the crude product with the minimum of cold water required to dissolve the carbonate, removing the undissolved part (which consists chiefly of sulphate), and evaporating the clear liquor to dryness in an iron pan. The purified carbonate (which still contains most of the chloride of the raw material and other impurities) is known as "pearl ashes."

Large quantities of carbonate used to be manufactured from the aqueous residue left in the distillation of beetroot spirit, *i.e.*, indirectly from beetroot molasses. The liquors are evaporated to dryness and the residue is ignited to obtain a very impure carbonate, which is purified by methods founded on the different solubilities of the several components. Such potashes, however, is exceptionally rich in soda: Grandeau found in crude ashes from 16 to 21 per cent. of potash and from 23 to 50 of soda carbonate. This industry would have expired by this time were it not that the beetroot spirit residues are worked for trimethylamine (see METHYL, vol. xvi. p. 196), and the carbonate thus obtained incidentally. Most of the carbonate of potash which now occurs in commerce is made from Stassfurt chloride by means of an adaptation of the "Leblanc process" for the conversion of common salt into soda ash (see SODIUM).

Chemically pure carbonate of potash is best prepared by the ignition of pure bicarbonate (see below) in iron or (better) in silver or platinum vessels, or else by the calcination of pure bitartrate (see TARTARIC ACID). The latter operation furnishes an intimate mixture of the carbonate with charcoal, from which the carbonate is extracted by lixiviation with water and filtration. The filtrate is evaporated to dryness (in iron or platinum) and the residue fully dehydrated by gentle ignition. The salt is thus obtained as a white porous mass, fusible at a red heat ($838^\circ C.$, Carnelley) into a colourless liquid, which freezes into a white opaque mass. The dry salt is very hygroscopic; it deliquesces into an oily solution ("oleum tartari") in ordinary air. 100 parts of water dissolve—

at $0^\circ C.$	$20^\circ C.$	$185^\circ C.$ (boiling point of saturated solution)
83	94	205

parts. Carbonate of potash, being insoluble in strong alcohol (and many other liquid organic compounds), is much used for the dehydration of the corresponding aqueous preparations. From its very concentrated solution in hot water the salt crystallizes on cooling with a certain proportion of water; but these crystals are little known even to chemists. Pure carbonate of potash is being constantly used in the laboratory, as a basic substance generally, for the disintegration of silicates, and as a precipitant. The industrial preparation serves for the making of flint-glass, of potash soap (soft soap), and of caustic potash. It is also used in medicine, where its old name of "sal tartari" is not yet quite obsolete.

Bicarbonate of Potash ($K_2OCO_2 + H_2OCO_2 = 2KHCO_3$) is obtained when carbonic acid is passed through a cold solution of the ordinary carbonate as long as it is absorbed. If silicate is present, it likewise is converted into bicarbonate with elimination of silica, which must be filtered

off. The filtrate is evaporated at a temperature not exceeding 60° or at most $70^\circ C.$; after sufficient concentration it deposits on cooling anhydrous crystals of the salt, while the chloride of potassium, which may be present as an impurity, remains mostly in the mother-liquor; the rest is easily removed by repeated recrystallization. If an absolutely pure preparation is wanted, it is best to follow Wöhler and start with the "black flux" produced by the ignition of pure bitartrate. The flux is moistened with water and exposed to a current of carbonic acid, which, on account of the condensing action of the charcoal, is absorbed with great avidity. The rest explains itself. Bicarbonate of potash forms large monoclinic prisms, permanent in the air. 100 parts of water dissolve—

at 0°	10°	20°	60°	70°
19.61	23.23	26.91	41.35	45.24

parts of salt. At higher temperatures than 70° the solution loses carbonic acid quickly. The solution is far less violently alkaline to the taste and test-papers than that of the normal carbonate. Hence it is preferred in medicine as an anti-acid. When the dry salt is treated it breaks up below redness into normal carbonate, carbonic acid, and water.

Caustic Potash (Hydrate of Potassium), KHO .—It has been known for a long time that a solution of carbonate of potash becomes more intensely alkaline, acts more strongly on the epidermis, and dissolves fats more promptly after it has been treated with slaked lime. It used to be supposed that the latent fire in the quick-lime went into the "mild" alkali and made it "caustic," until Black, about the middle of last century, showed that the chemical difference between the two preparations is that the mild is a compound of carbonic acid and the caustic one of water with the same base (potash),—the causticizing action of the lime consisting in this, that it withdraws the carbonic acid from the alkali and substitutes its own water. Add to this that the exchange takes place only in the presence of a sufficient proportion of water, and that it is undone if the mixture is allowed to get concentrated by evaporation beyond a certain (uncertain) point, and you have a full theory of the process. A good concentration is twelve parts of water for one of carbonate of potash; the lime is best employed in the shape of a semi-fluid paste, made by slaking quick-lime with three parts of water poured on at a time. The alkali solution is heated to boiling in a cast-iron vessel (industrially by means of steam-pipes) and the lime paste added in instalments until a sample of the filtered mixture no longer effervesces on addition of an excess of acid. The mixture is then allowed to settle in the iron vessel, access of air being prevented as much as practicable, and the clear liquor is drawn off by means of a syphon. The remaining mud of carbonate and hydrate of lime is washed, by decantation, with small instalments of hot water to recover at least part of the alkali diffused throughout it, but this process must not be continued too long or else some of the lime passes into solution. The united liquors are boiled down in an iron vessel until the desired degree of concentration is reached. In obedience to an old tradition, the concentration is habitually continued until the specific gravity of the cold ley is 1.333, which is a rather inconveniently high degree of strength for most purposes, but in the case of the ordinary commercial article offers this advantage, that any sulphate of potash which may be present as an impurity crystallizes out completely on standing (Liebig). If solid caustic potash is wanted, the ley (after removal of the deposit of sulphate, &c.) is transferred to a silver dish, and the evaporation continued until, instead of steam, the heavy vapour of KHO itself is seen to go off. The residual oily liquid is then poured out into

a polished iron tray, or into an iron mould to produce the customary form of "sticks," and allowed to cool. The solidified preparation must be at once bottled up, because it attracts the moisture and carbonic acid of the air with great avidity and deliquesces. According to the present writer's experience (*Journ. Soc. Chem. Ind.*, May 1884), nickel basins are far better adapted than iron basins for the concentration of potash ley. The latter begin to oxidize before the ley has come up to the traditional strength, while nickel is not attacked so long as the percentage of real KHO is short of 60. For the fusion of the dry hydrate nickel vessels cannot be used; in fact, even silver is perceptibly attacked as soon as *all* the excess of water is away; absolutely pure KHO can be produced only in *gold* vessels. Regarding the action of potash on platinum, see PLATINUM (*supra*, p. 191). Glass and (to a less extent) porcelain are attacked by caustic potash ley, slowly in the cold, more readily on boiling.

Frozen caustic potash forms an opaque, white, stone-like mass of dense granular fracture; specific gravity = 2.1. It fuses considerably below and is perceptibly volatile at a red heat. It is extremely soluble in even cold water, and in any proportion of water on boiling. The solution is intensely "alkaline" to test-papers. It readily dissolves the epidermis of the skin and many other kinds of animal tissue,—hence the well-known application of the "sticks" in surgery. A dilute potash ley readily emulsionizes fats, and on boiling "saponifies" them with formation of a soap and of glycerin. Caustic potash is the very type of an energetic (mono-acid) basic hydrate (see CHEMISTRY, vol. v. pp. 486, 488).

According to Tünnermann's and Schiff's determinations, as calculated by Gerlach, the relation in pure potash ley between specific gravity at 15° C. and percentage strength is as follows:—

Percentages of KHO or K ₂ O.	Specific Gravity, if percentage refers to		Percentages of KHO or K ₂ O.	Specific Gravity, if percentage refers to	
	K ₂ O.	KHO.		K ₂ O.	KHO.
0	1.000	1.000	25	1.285	1.230
1	1.010	1.009	30	1.355	1.288
10	1.099	1.088	40	1.504	1.411
15	1.154	1.128	50	1.660	1.539
20	1.215	1.177	60	1.810	1.667

All commercial caustic potash is contaminated with excess of water (over and above that in the KHO) and with carbonate and chloride of potassium; sulphate, as a rule, is absent. Absolutely pure potash has perhaps never been seen; a preparation sufficing for most purposes of the analyst is obtained by digesting the commercial article in strong (85 per cent. by weight) *pure* alcohol. The hydrate KHO dissolves in the alcohol of the solvent; the chloride and the carbonate unite with the water and form a lower layer or magma, from which the alcoholic solution of the KHO is decanted off, to be evaporated to dryness and fused in silver vessels ("potasse à l'alcool").

The metal (potassium) has been known to exist since Lavoisier, but was first obtained as a substance by Humphry Davy in 1807. He prepared it from the hydrate by electrolysis. Gay-Lussac and Thénard subsequently found that this substance can be reduced to the metallic state more easily by passing its vapour over white hot metallic iron; but even their method as a mode of preparation was soon superseded by Brunner's, who, to the surprise of his contemporaries, produced the metal by simply distilling its carbonate with charcoal—applying an old-established principle of ordinary metallurgy. Brunner's process is used to the present day for the production of the metal.

One of those cylindrical, neckless, wrought-iron bottles which serve for the storing of quicksilver is made into a retort by taking out the screw-plug at the centre of one of the round ends and

substituting for it a short, ground-in, iron outlet pipe. This retort is charged with a black flux made from a mixture of pure and crude bitartrate so adjusted that the flux contains as nearly as possible the proportion of free carbon demanded by the equation $K_2CO_3 + 2C = 2K + 3CO$. It is then suspended horizontally within a powerful wind-furnace, constructed for coke as fuel. At first a mixture of coke and charcoal is applied, to produce the right temperature for chasing away the moisture and enabling one to, so to say, varnish over the retort with borax and thus protect it against the subsequent intense heat. After these preliminaries coke alone is used and the fire urged on to, and maintained at, its maximum pitch, when potassium vapour soon begins to make its appearance. The condensation of this vapour, however, demands special methods, because even the cold metal would quickly oxidize in the air and act most violently on liquid water. Brunner used to condense the vapour by passing it into a small copper vessel charged with rock-oil (see PARAFFIN, vol. xviii. p. 237), in which liquid the condensed metal sinks to the bottom and thus escapes the air. Donné and Maresca dispense with rock-oil altogether; they receive the vapour in a dry condenser made of two flat rectangular trays of wrought iron which fit closely upon each other, enclosing a space such as might be used as a mould for casting a thin cake of any ordinary metal. This condenser has a short neck into which the outlet pipe of the retort fits; and the pipe must be as short as possible, because it is essential (Donné and Maresca) that the hot vapour pass abruptly from its original high to a low temperature, to evade a certain range of medium temperatures at which the metal combines with carbonic oxide into a black solid, which may obstruct the outlet pipe. The formation of this bye-product cannot be altogether avoided; hence a long borer is inserted into the condenser from the first to enable one to clear the throat of the retort at a moment's notice. The condenser is kept as far as possible cold by the constant application to it of damp cloths. As soon as the distillation is finished the (still hot) condenser is plunged into a bucketful of rock-oil, to cool it down, the mould opened (under the oil), and the now solid metal taken out. The crude metal is always contaminated with some of the black solid and other mechanical impurities. To remove these the best method is to redistil it from out of a small iron retort and condense the vapour in rock-oil according to Brunner's original plan. The purified metal is soft enough to be moulded (under rock-oil) into globular pieces, which are preserved in bottles filled to the top with the protecting liquid. But even this does not prevent gradual oxidation; bright metallic potassium can be maintained in this condition only by preserving it in a sealed-up glass tube within a vacuum or in an atmosphere of hydrogen or some other inert gas. The black solid above referred to is a most dangerous substance. When exposed to the air it turns red and then explodes either spontaneously or on the slightest provocation by friction or pressure. Even if kept under rock-oil it gradually becomes explosive. The distillation of potassium, in fact, is a dangerous operation, which had better be left in the hands of specialists.

Pure potassium is a bluish-white metal; but on exposure to ordinary air it at once draws a film of oxide, and on prolonged exposure deliquesces into a solution of hydrate and carbonate. At temperatures below 0° C. it is pretty hard and brittle; at the ordinary temperature it is so soft that it can be kneaded between the fingers and cut with a blunt knife; specific gravity = 0.865. It fuses at 62°·5 C. (Bunsen), and at 720° to 730° C. (Carnelley and Williams), i.e., considerably below its boiling point, begins to distil with formation of an intensely green vapour. When heated in air it fuses and then takes fire and burns into a mixture of oxides. Most remarkable, and characteristic for the group it represents, is its action on water. A pellet of potassium when thrown on water at once bursts out into a violet flame and the burning metal fizzes about on the surface, its extremely high temperature precluding absolute contact with the liquid, except at the very end, when the last remnant, through loss of temperature, is wetted by the water and bursts with explosive violence. What really goes on chemically is that the metal decomposes the water thus, $K + H_2O = KHO + H$, and that the hydrogen catches fire, the violet colour of the flame being due to the potassium vapour diffused throughout it. Similar to that on water is its action on alcohol: the alcohol is converted into ethylate, while hydrogen escapes, $K + C_2H_5 \cdot OH = C_2H_5 \cdot OK + H$, this time without inflammation. So strong is the basilius character of the element that, in opposition to it, even ammonia behaves like an

acid. When the oxide-free metal is heated gently within the dry gas it is gradually transformed into a blue liquid, which on cooling freezes into a yellowish-brown or flesh-coloured solid. This body is known as "potassamide," KNH_2 . When heated by itself to redness the amide is decomposed into ammonia and nitride of potassium, $3\text{NH}_2\text{K} = \text{NK}_3 + 2\text{NH}_3$. The nitride is an almost black solid. Both it and the amide decompose water readily with formation of ammonia and caustic potash. Potassium at temperatures from 200° to 400° C. "occludes" hydrogen gas, as palladium does (see "Palladium," under PLATINUM, *supra*, p. 193). The highest degree of saturation corresponds approximately to the formula K_2H for the "alloy," or to about 126 volumes of gas (measured cold) for one volume of metal. In a vacuum or in sufficiently dilute hydrogen the compound from 200° upwards loses hydrogen, until the tension of the free gas has arrived at the maximum value characteristic of that temperature (Troost and Hautefeuille).

Potassium Oxides, singularly, can be produced only from the metal, and another remarkable fact is that the one with which all chemical students imagine they are so familiar—namely, "anhydrous potash," K_2O —is little more than a fiction. According to Vernon Harcourt, when the metal is heated cautiously, first in dry air and then in dry oxygen, it is transformed into a white mass (K_2O_2 ?), which, however, at once takes up more oxygen with formations ultimately of a yellow powdery tetroxide (K_2O_4), fusible at a red heat without decomposition. At a white heat it loses oxygen and leaves a residue of lower oxides (K_2O ?). When heated in hydrogen it is reduced to ordinary potash, KHO . When dissolved in excess of dilute acid it yields a mixed solution of the respective potash salt and peroxide of hydrogen, with abundant evolution of oxygen gas.

Potassium Salts.—There is only one series of these known, namely, the salts produced by the union of potash (KHO) with acids.

Chloride, KCl .—This salt (commercial name, "muriate of potash") is at present being produced in immense quantities at Stassfurt from the so-called "Abraumsalze." For the purpose of the manufacturer of muriate these are assorted into a raw material containing approximately in 100 parts—55-65 of carnallite (representing 16 parts of chloride of potassium); 20-25 of common salt; 15-20 of kieserite, a peculiar, very slowly soluble sulphate of magnesia, $\text{MgSO}_4 \cdot \text{H}_2\text{O}$; 2-4 of tachydrate ($\text{CaCl}_2 \cdot 2\text{MgCl}_2 + 12\text{H}_2\text{O}$); and minor components. This mixture is now wrought mainly in two ways. (1) The salt is dissolved in water with the help of steam, and the solution is cooled down to from 60° to 70° , when a quantity of impure common salt crystallizes out, which is removed. The decanted ley deposits on cooling and standing a 70 per cent. muriate of potash, which is purified, if desired, by washing it by displacement with cold water. Common salt principally goes into solution, and the percentage may thus be brought up to from 80 to 95. The mother-liquor from the 70 per cent. muriate is evaporated down further, the common salt which separates out in the heat removed as it appears, and the sufficiently concentrated liquor allowed to crystallize, when almost pure carnallite separates out, which is easily decomposed into its components (see *infra*). (2) Ziervogel and Tuchen's method. The crude salt is ground up and then heated in concentrated solution of chloride of magnesium with mechanical agitation. The carnallite principally dissolves and crystallizes out relatively pure on cooling. The mother-liquor is used for a subsequent extraction of fresh raw salt. The carnallite produced is dissolved in hot water and the solution allowed to cool, when it deposits a coarse granular muriate of potash containing up to 99 per cent. of the pure substance. The undissolved residue produced in either process consists chiefly of kieserite and common salt. It is worked up either for Epsom salt and common salt, or for sulphate of soda and chloride of magnesium. The potassiferous bye-products are utilized for the manufacture of manures.

Chemically pure chloride of potassium is most conveniently prepared from pure perchlorate (see *infra*) by dioxygenating it in a platinum basin at the lowest temperature and then fusing the residue in a well-covered platinum crucible. The fused product solidifies on cooling into a colourless glass. Chloride of potassium dissolves in water and crystallizes from the solution in anhydrous cubes. 100 parts of water dissolve—

at 0°	10°	20°	50°	100° C.
29.2	32.0	34.7	42.8	56.6

parts of the salt. When a sufficiency of hydrochloric-acid gas is passed into the solution the salt is completely precipitated as a fine powder. If the original solution contained chloride of magnesium or calcium or sulphate of potash, all impurities remain in the mother-liquor (the SO_3 as KHSO_4), and can be removed by

washing the precipitate with strong hydrochloric acid. Chloride of potassium fuses at 738° C. (Carnelley), and at a red heat volatilizes rather abundantly.

Chlorate, KClO_3 .—This industrially important salt was discovered in 1786 by Berthollet, who correctly designated it as "peroxidized muriate." Chlorine gas is largely absorbed by cold caustic-potash ley with formation of chloride and hypochlorite, $2\text{KHO} + \text{Cl}_2 = \text{KCl} + \text{KClO} + \text{H}_2\text{O}$. When the mixed solution is boiled it suffers, strictly speaking, a complicated decomposition, which, however, in the main comes to the same as if the hypochlorite broke up into chloride and chlorate, $3\text{KClO} = 2\text{KCl} + \text{KClO}_3$. Hence chlorate of potash is easily produced by passing chlorine into hot caustic-potash ley so as at once to realize the change, $6\text{KHO} + 3\text{Cl}_2 = 3\text{H}_2\text{O} + 5\text{KCl} + \text{KClO}_3$; and this method used to be followed industrially until Liebig pointed out that five-sixths of the potash can be saved by first substituting milk of lime, $\text{Ca}(\text{OH})_2 = 2\text{CaOH}$, for the potash ley and from the mixed solution of lime-salts precipitating, so to say, the chloric acid as potash salt by adding 1KCl for every 1CaClO_3 present, concentrating by evaporation, and allowing the KClO_3 to crystallize out. This is the present industrial process. For the technical details we must refer to the handbooks of chemistry. Suffice it to say that in practice about 1.08 times KCl are used for every 1CaClO_3 , and that the salt produced is almost chemically pure after one recrystallization. By repeated recrystallization every trace of impurities is easily removed. The crystals are colourless transparent monoclinic plates, which, unless formed very slowly, are very thin, so as often to exhibit the Newton's colours. 100 parts of water dissolve—

at 0°	15°	50°	104°S (on boiling)
3.3	6	19	60

parts of the salt (Gay-Lussac). The salt is almost insoluble in strong alcohol. It is permanent in the air. It fuses at 359° C. (Carnelley), and at about 178° above the temperature of its formation the liquid gives off oxygen with evolution of heat, and formation ultimately of chloride (and oxygen). The salt accordingly, in opposition to any combustible matter with which it may be mixed, behaves at the same time as a store of highly-condensed loosely-combined oxygen and of potential heat. Hence its manifold applications in artillery and pyrotechnics are easily understood. To give one example of the readiness with which it acts as a burning agent: a mixture of it and sulphur when struck with a hammer explodes loudly, the mechanical blow sufficing to produce locally the temperature necessary for starting the reaction. When the salt was still a novelty it was tried as a substitute for the nitre in gunpowder. Such powder, however, proved too good to be safe. More recently a mixture of 49 parts of the chlorate, 23 of sugar, and 23 of prussiate of potash was recommended by Pohl as a preferable substitute for gunpowder, but this powder has never come into actual use anywhere. We must not forget to point out that mixtures of chlorate of potash and combustible substances must on no account be made in a mortar; this would be sure to lead to dangerous explosions. The several ingredients must be powdered separately and only then be mixed together on a sheet of paper or on a table, all unnecessary pressure or friction being carefully avoided.

The decomposition of chlorate of potash by heat is greatly facilitated by admixture of even small proportions of certain solid oxides, e.g., oxide of copper, of iron, or of manganese. The oxygen, in the case of binoxide of manganese, for instance, comes off below the fusing point of the salt. Hence a salt contaminated with even a small proportion of heavy metallic chlorate cannot (in general) be fused without decomposition. The writer observed this anomaly with a commercial chlorate which happened to contain about one half per cent. of chlorate of zinc. The aqueous solution of the salt is neutral and bears prolonged boiling without decomposition. On acidification with dilute sulphuric acid it assumes the reactions of a solution of chloric acid, i.e., of a powerful but readily controllable oxidant. In this capacity it is used in calico-printing as a "discharge." In the same industry it serves for making the chlorate of soda needed for the production of aniline black. In the chemical laboratory it is in constant requisition as a source of oxygen and as an oxidizing agent. In the hands of Marignac it served for the determination of the important ratio $\text{KCl} : \text{SO}_3$.

Perchlorate, KClO_4 .—The decomposition of chlorate of potash by heat, if catalytic agents like MnO_2 , &c., are absent, proceeds by two stages. In the first the salt breaks up thus, $2\text{KClO}_3 = \text{KCl} + \text{O}_2 + \text{KClO}_4$; in the second the perchlorate at a higher temperature is decomposed into chloride and oxygen. The termination of the first stage is marked by a slackening in the evolution of the oxygen and by the residual salt (which, at the beginning, is a thin fluid) becoming pasty. From the mixture $\text{KCl} + \text{KClO}_4$ the chloride is extracted by lixiviation with successive instalments of cold water. The residual perchlorate is very easily purified by recrystallization (compare pure chloride of potassium, *supra*). Perchlorate of potash dissolves in 88 parts of water of 10°C , and in far less of boiling water. It is absolutely insoluble in absolute alcohol. It begins to give off its oxygen at about 400° C., which is below its fusing point.

The salt has been recommended as a substitute for chlorate in pyrotechnic mixtures, because it contains more oxygen, and yet, on account of its greater stability, is a less dangerous ingredient.

Bromide, KBr.—This salt is formed when bromine is dissolved in caustic-potash ley. The reaction is quite analogous to that going on in the case of chlorine; only the hypobromite (KBrO) first produced is far less stable than hypochlorite, and vanishes after short heating. The addition of bromine is continued until the liquid is permanently yellow and retains its colour after short heating. The solution is then evaporated to dryness and the bromate decomposed by cautious heating. A small portion of the bromate breaks up into $\text{K}_2\text{O} + \text{Br}_2 + 5\text{O}$; hence the residual bromide is contaminated with a little free alkali; but this is easily set right by neutralizing its solution with hydrobromic acid. The salt crystallizes in colourless transparent cubes, easily soluble in water. It is used in medicine for quieting the nerves,—to cure sleeplessness, for instance; also (internally) as a local anæsthetic preparatory to operations on the larynx or the eye. The dose of the pure (KI free) salt for adults can safely be raised to 2 grammes (about 30 grains). It is also used in photography.

Iodide, KI.—Of the very numerous methods which have been recommended for the preparation of this important salt the simplest (and probably the best) is to dissolve in a caustic-potash ley (which is dilute enough to hold the rather difficultly soluble iodate KIO_3 in solution) enough iodine to produce a permanent yellow colour (the iodine passes at once into $5\text{KI} + \text{KIO}_3$; the hypo body KIO has no existence practically) and to deoxidize the iodate, which is done most conveniently by adding a sufficiency of powdered charcoal to the solution, evaporating to dryness in an iron vessel, and heating the residue. The oxygen goes off as CO_2 at a lower temperature than that which would be needed for its expulsion as oxygen gas. The residue is dissolved, and the solution filtered and evaporated to crystallization. The salt comes out in colourless transparent cubes, very easily soluble in even cold water. The commercial salt forms opaque milk-white crystals, which, as a matter of habit, are preferred to the clear salt, although they are produced by causing the salt to crystallize from a strongly alkaline solution and by drying the crystals (finally) in a stream of hot air, and although through the former operation they are at least liable to contain carbonate. Iodide of potassium acts far more powerfully on the human system than bromide, and therefore is administered in smaller doses. It is used against skin-diseases, and also for eliminating the mercury which settles in the system after long-continued administration of mercurial medicines. It is also used, far more largely than the bromide, in photography. See PHOTOGRAPHY, *passim*.

Sulphate (K_2SO_4) used to be extracted from kainite, but the process is now given up because the salt can be produced cheaply enough from the muriate by decomposing it with its exact equivalent of oil of vitriol and calcining the residue. To purify the crude product it is dissolved in hot water and the solution filtered and allowed to cool, when the bulk of the dissolved salt crystallizes out with characteristic promptitude. The very beautiful (anhydrous) crystals have as a rule the habitus of a double six-sided pyramid, but really belong to the rhombic system. They are transparent, very hard, and absolutely permanent in the air. They have a bitter salty taste. 100 parts of water dissolve—

at 0°	12°	100° C.
8.36	10	26

parts of the salt. Sulphate of potash fuses at a strong red heat, and at this temperature volatilizes, for an alkaline salt, rather slowly. The chloride, weight for weight, volatilizes at ten times the rate (Bunsen). Sulphate of potash used to be employed in medicine, but is now obsolete. The crude salt is used occasionally in the manufacture of glass.

Bisulphate (KHSO_4) is readily produced by fusing thirteen parts of the powdered normal salt with eight parts of oil of vitriol. It dissolves in three parts of water of 0° C. The solution behaves pretty much as if its two congeners, K_2SO_4 and H_2SO_4 , were present side by side of each other uncombined. An excess of alcohol, in fact, precipitates normal sulphate (with little bisulphate) and free acid remains in solution. Similar is the behaviour of the fused dry salt at a dull red heat; it acts on silicates, titanates, &c., as if it were sulphuric acid raised beyond its natural boiling point. Hence its frequent application in analysis as a disintegrating agent.

For the following potash salts we refer to the articles named:—**Chromates**, see CHROMIUM; **Cyanide and Ferrocyanide**, PRUSSIC ACID; **Chloroplatinate**, PLATINUM (*supra*, p. 192); **Nitrate**, NITROGEN (vol. xvii. p. 518); **Phosphates**, PHOSPHORUS (vol. xviii. pp. 818-19); **Oxalates**, OXALIC ACID; **Sulphides and Sulphites**, SULPHUR; **Silicates**, GLASS (vol. x. p. 655 *sq.*) and SILICA; **Tartrates**, TARTARIC ACID. For potash salts not named, see the handbooks of chemistry.

Rubidium and Cæsium.—When Bunsen and Kirchhoff in 1860 applied their method of spectrum analysis to the alkali salts which they had extracted analytically from Dürkheim mineral water, they obtained a spectrum which,

in addition to the lines characteristic for sodium, potassium, and lithium, exhibited two blue lines which were foreign to any other spectrum they had ever seen. They accordingly concluded that these lines must be owing to the presence of a new alkali metal, which they called "cæsium." Bunsen at once resumed the preparation of the mixed alkaline salt with 44,000 litres of Dürkheim water, with the view of isolating the cæsium in the form of a pure salt; and he was more than successful—for the new alkali salt, after elimination of all the ordinary alkali metals, proved to be a mixture of the salts of two new alkali metals, which he succeeded in separating from each other. For one he retained the name already chosen; the other he called "rubidium," on account of the presence in his spectrum of certain characteristic red lines. Since Bunsen's time these two metals have been discovered in a great many native potassiferous materials—minerals, mineral waters, plant ashes, &c.—but in all cases they form only a small fraction of the alkali, the cæsium in general amounting to only a fraction of even the rubidium. One solitary exception to both rules is afforded by a rare mineral called "pollux," which is found only on the island of Elba. Plattner analysed this mineral in 1846 and recognized it as a compound silicate of alumina, oxide of iron, soda, potash, and water; but his quantitative analysis came up to only 92.75 per cent., and he could not account for the 7.25 per cent. of loss. After Bunsen's discovery Pisani analysed the mineral again, and he found that it contained no potash at all, but, instead of it, a large percentage (34.1) of cæsia. Recalculating Plattner's analysis on the assumption that the presumed chloroplatinate of potassium was really chloroplatinate of cæsium, he found that the corrected numbers did add up to near 100 and agreed with his own. Rubidium, singularly, is absent from this mineral.

That both rubidium and cæsium are contained in sea water might well be taken for granted; but it is worth while to state that Schmidt of Dorpat actually proved the presence of rubidium, and even determined it quantitatively.

For the preparation of rubidium compounds one of the best materials is a mixture of alkaline salts, which falls as a bye-product in the industrial preparation of carbonate of lithia from lepidolite. A supply of this salt mixture which Bunsen worked up contained 20 per cent. of chloride of rubidium, 33 of chloride of potassium, and 36 of common salt, but very little cæsium; his supply came from the Saxon or Bohemian mineral. The lepidolite of Hebron, Maine, United States, on the other hand, is rich in cæsium. Another practically available source for cæsium is the mother-liquor salt of Nauheim in Germany. It yielded to Böttcher 1 per cent. of its weight of the chloroplatinate PtCl_6Cs_2 .

Bunsen's method for the extraction of the two rare potassium metals from a given mixture of alkaline salts is founded upon the different solubility of the several alkaline chloroplatinates. According to him 100 parts of water dissolve—

	Potassium	Rubidium	Cæsium
at 0° C.	0.74	0.13	0.024
" 20° C.	1.12	0.14	0.070
" 100° C.	5.13	0.63	0.977

parts of the several salts. The chloroplatinates of sodium and lithium are easily soluble even in cold water, so that chloride of platinum does not precipitate these two metals at all. Hence, supposing we boil a given mixture of chloroplatinates of potassium and (say) rubidium with a quantity of water insufficient to dissolve the whole, part of both salts will dissolve; but the residual chloroplatinate will be richer in rubidium than the dissolved part. And supposing, on the other hand, we add to a mixed solution of the two chlorides a quantity of chloroplatinic-acid solution insufficient to bring down the whole of both metals, the rubidium will accumulate in the precipitate and the potassium in the solution. It is also easily understood that, if the amount of reagent added falls short even of that which would be needed by the rubidium if present alone, a very nearly pure PtCl_6Rb_2 may be expected to come down. Any dry chloroplatinate is easily reduced to a mixture of metallic platinum and alkaline chloride by the simple operation of heating in hydrogen to about 300° C. The chloride can be dissolved out, and thus again made amenable to fractional precipitation by

platinum solution, and the platinum be reconverted into reagent by means of aqua regia. Hence the process is not so expensive as it might at first sight appear.

Redtenbacher has worked out an analogous process to Bunsen's, founded upon the different solubility of the three alums— $\text{Al}_2\text{R}(\text{SO}_4)_2 + 12\text{H}_2\text{O}$. At 17°C . 100 parts of water dissolve of the alum of

Potassium	Rubidium	Cæsium
13.5	2.27	0.62

parts. Sodium and lithium alum are very easily soluble in water, and remain dissolved in the first mother-liquor when the mixed alum of K, Rb, and Cs crystallizes out. These three alums are parted by repeated crystallization, and the rare alkalis recovered from their respective alums by precipitation with chloride of platinum.

The separation of rubidium and cæsium offers great difficulties. According to Godeffroy an approximate separation may be effected by dissolving the mixed chlorides in strong hydrochloric acid, and adding a solution of terchloride of antimony in the same menstruum; the cæsium (chiefly) comes down as $\text{SbCl}_3 + 6\text{CsCl}$; the bulk of the rubidium remains dissolved. The two rare alkali metals are so closely similar to potassium that it will suffice to give a tabular statement of the principal points of difference. By way of introduction, however, we may state that rubidium metal was prepared by Bunsen from the black flux obtained by igniting the bitartrate, by Brunner's method for potassium. Metallic cæsium, it seems, cannot be thus obtained; but in 1883 Setterberg made it by the electrolysis of a fused mixture of the cyanides of cæsium and barium.

Analysis.—In this section we treat of the detection and determination of alkali metals generally. If the given substance is a solid, a good preliminary test is to heat about one centigramme of it at one end of a fine platinum wire in the flame-mantle of a Bunsen lamp, or in a blow-pipe flame just at the end of the inner cone. Most alkali salts are sufficiently volatile to impart to the flame the colour characteristic of the respective metallic vapour. Certain native silicates and certain other compounds do not volatilize, but these can be rendered amenable to the test by mixing them with sulphate of lime and then applying the flame, whereupon alkaline sulphate is formed which volatilizes. The flame-colours are—

Potassium, Rubidium, Cæsium.	Sodium.	Lithium.
Violet.	Yellow.	Red.

These flame-reactions are very delicate but not conclusive, because in the case of mixtures several colours may be radiated out at the same time, and one may eclipse all the rest—this holds, for instance, for things containing sodium, whose flame-colour is more intense than that of any other metal—or a mixed colour may be produced which the eye is incompetent to analyse. The spectrum apparatus here comes in usefully; and by means of it it is in general possible to see the lines characteristic of the several metals in presence of, or at least after, one another, because as a rule the several metals are present as compounds of different volatility.

For a thorough analysis it is necessary to begin by bringing the substance into aqueous or acid solution, and next to eliminate all that is *not* alkali metal by suitable methods. A certain set of heavy metals can be precipitated as sulphides by means of sulphuretted hydrogen in the presence of acid, all the rest of these by means of sulphide of ammonium from an alkaline solution. From the filtrate, barium, strontium, and calcium are easily precipitated by means of carbonate of ammonia on boiling, so that, if the filtrate from these carbonates is evaporated to dryness and the residue kept at a dull red heat long enough to drive away the ammonia salts, nothing can be left but salts of alkali metals and magnesium. This residue is dissolved in a small quantity of water, and any residual basic salt of magnesium filtered off. The filtrate is then ready to be tested for alkali metals as follows: if *magnesia be absent*, potassium or rubidium (not cæsium) can be detected by addition (to a neutral or feebly acetic solution) of a saturated solution of bitartrate of soda. Potassium and rubidium come down as crystalline bitartrates. The reaction may take some time to become manifest, but can be accelerated by vigorous stirring. In a separate quantity of the solution lithium may be searched for by means of carbonate of soda or trisodic phosphate as explained under LITHIUM

(vol. xiv. p. 697). For soda we have no characteristic precipitant. In any case the spectrum apparatus should be used for controlling and, if necessary, supplementing the wet-way tests. The case of *magnesia being present* need not be specially considered, because the qualitative method will easily be deduced from what is said in the following paragraph.

Quantitative Determinations.—An exhaustive treatment of this subject would be out of place here. We confine ourselves to two cases. (1) A mixture of alkaline chlorides only. In this case the potassium (including Rb and Cs) is best separated out by adding a quantity of chloroplatinic acid solution sufficient to convert *all the metals* into chloroplatinates, to evaporate to dryness over a water-bath, and from the residue to extract the lithium and sodium salts by lixiviation with alcohol of 70 per cent. (by weight). The residual chloroplatinate is collected on a filter, dried at 110°C ., and, if Rb and Cs are absent, weighed as chloroplatinate of potassium, PtCl_5K_2 ($\text{PtCl}_5\text{K}_2 \times 0.3071 = 2\text{KCl}$). The chloride of sodium is determined by difference—if lithium be absent. The case of its presence cannot be here considered. (2) A mixture of alkalis combined with sulphuric acid, or such volatile acids as can be expelled by sulphuric. In this case it is best to begin by converting the whole into neutral sulphates, and then to apply the method of Finkener, which, amongst other advantages, offers the one that it does *not* demand the absence of *magnesia*. The mixed sulphate is dissolved in water and the solution mixed with a little more than the volume of chloroplatinic acid ("platinum solution") demanded by the potassium (Rb and Cs). The mixture is placed in a water bath and, if necessary, diluted with sufficient water to bring the whole of the precipitated chloroplatinate into hot solution. The solution is then evaporated very nearly to dryness (on the water bath, with continuous stirring towards the end to avoid formation of crusts), allowed to cool, and the residue mixed, first with twenty times its volume of absolute alcohol, then with ten volumes of absolute ether. The mixture is allowed to stand in a well-covered vessel for some hours, to enable the precipitate to settle completely. The precipitate contains all the potassium as chloroplatinate, and most of the sodium and magnesium, and also part of the lithium in the sulphate form. It is washed with ether-alcohol (to complete filtrate A), and then lixiviated as quickly as possible with cold concentrated solution of sal-ammoniac, which dissolves away the sulphates (filtrate B). The residual chloroplatinate is dried within the filter in a porcelain crucible, which is next heated so as to char the paper at the lowest temperature. The residue is then ignited gently in hydrogen, and from the resulting residue the chloride of potassium is extracted by water, to be determined as chloroplatinate, as shown in (1), or otherwise. From the undissolved residue the charcoal is burned away and the residual platinum weighed to check the potassium determination. After removal of the ether and alcohol from filtrate A by distillation, the two filtrates A and B are mixed, evaporated to dryness, the ammonia salts chased away by heating, and the residue is reduced (at about 300°C .) in hydrogen to bring the platinum into the form of metal, from which the *magnesia* and alkali salts are easily dissolved away by means of water or dilute acid. The whole of the salts are then made into neutral sulphate, which is weighed and then dissolved in a known weight of water. The lithium and the magnesium are determined in aliquot parts of the solution and calculated as sulphates. The soda is found by difference. A case intermediate between (1) and (2) often presents itself in practice. We refer to the commercial muriate from Stassfurt. In such an impure muriate the potassium can be determined promptly and accurately by adding to the very concentrated solution of the substance a large excess of a very concentrated solution of chloroplatinic acid,—"*excess*" meaning more platinum than necessary to make all the metals into chloroplatinates. The precipitate is allowed to settle, collected on a small filter, and washed, first with successive instalments of a platinum solution (containing 5 per cent. of metal), then with ordinary alcohol; it is next dried, and weighed as above (Tatlock's method slightly modified). In exact analyses the small quantity of potassium which passes into the filtrate is recovered—ultimately by Finkener's method—and allowed for.

(W. D.)

POTATO. The potato (*Solanum tuberosum*) is too well known to need detailed description. It owes its value to the peculiar habit of developing underground slender leafless shoots or branches which differ in character and office from the true roots, and which gradually swell at the free end and thus produce the tubers with which we are so familiar. The nature of these tubers is further rendered evident by the presence of "eyes" or leaf-buds, which in due time lengthen into shoots and form the haulm or stems of the plant. Such buds are not, under ordinary circumstances, formed on roots. What the determining cause of the formation of the tubers may be

is not known; the object evidently is to secure a method of propagation independently of the seed. Starch and other matters are stored up in the tubers, as in the perisperm of a seed, and in due season are rendered available for the nutrition of the young shoots when they begin to grow. The young shoots, in fact, derive their nourishment from the parent tuber until by the production of roots and leaves they are enabled to shift for themselves. When grown under natural circumstances (without being earthed up, as is usually done by the cultivator) the tubers are relatively small and close to the surface of the soil, or even lie upon it. In the latter case they become green and have an acrid taste, which would probably render them objectionable to predatory animals or insects, and which certainly renders them unpalatable to human beings, and, in consideration of the known poisonous qualities of many *Solanaceæ*, might probably cause them to be unwholesome. Hence the recommendation to keep the tubers in cellars or pits, not exposed to the light, for the green colouring matter is, in this case, developed in the tubers independently of the direct action of light on the leaves. Among the six hundred species of *Solanum* less than a dozen have this property of forming tubers, but similar growths are formed at the ends of the shoots of the common bramble, of the *Convolvulus sepium*, of the *Helianthus tuberosus*, the so-called Jerusalem artichoke, of *Sagittaria*, and other plants. Tubers are also sometimes formed on aerial branches, as in some Aroids, Begonias, &c. The production of small green tubers on the haulm, in the axils of the leaves of the potato, is not very unfrequent, and affords an interesting proof of the true morphological nature of the underground shoots and tubers. The so-called fir-cone potatoes, which are elongated and provided with scales at more or less regular intervals, show also very clearly that the tuber is only a thickened branch with "eyes" set in regular order, as in an ordinary shoot. The potato tuber consists mainly of a mass of cells filled with starch and encircled by a thin corky rind. A few vessels and woody fibres traverse the tubers.

The chief value of the potato as an article of diet consists in the starch it contains, and to a less extent in the potash and other salts. The quantity of nitrogen in its composition is small, and hence it should not be relied on to constitute the staple article of diet, unless in admixture with milk or some other substance containing nitrogen. Letheby gives the following as the average composition of the potato—

Nitrogenous matters	2.1	Saline matter	0.7
Starch, &c.	18.8	Water	75.0
Sugar	3.2		
Fat	0.2		100.0

—a result which approximates closely to the average of nineteen analyses cited in *How Crops Grow* from Grouven. In some analyses, however, the starch is put as low as 13.30, and the nitrogenous matter as 0.92 (Dehérain, *Cours de Chimie Agricole*, p. 159). Boussingault gives 25.2 per cent. of starch and 3 per cent. of nitrogenous matter. Warrington states that the proportion of nitrogenous to non-nitrogenous matter in the digestible part of potatoes is as 1 to 10.6. The composition of the tubers evidently varies according to season, soils, manuring, the variety grown, &c., but the figures cited will give a sufficiently accurate idea of it. The "ash" contains on the average of thirty-one analyses as much as 59.8 per cent. of potash, and 19.1 per cent. of phosphoric acid, the other ingredients being in very minute proportion. Where, as in some parts of northern Germany, the potato is grown for the purpose of manufacturing spirit great attention is necessarily paid to the quantitative analysis of

the starchy and saccharine matters, which are found to vary much in particular varieties, irrespective of the conditions under which they are grown.

The origin and history of the potato are better known than in the case of many long-cultivated plants. It is to the Spaniards that we owe this valuable esculent, "optimum benigni Numinis donum, dapes grata diviti, pauperi panis," as it has been called by an eminent botanist. The Spaniards met with it in the neighbourhood of Quito, where it was cultivated by the natives. In the *Cronica de Peru* of Pedro Cieça, published at Seville in 1553, as well as in other Spanish books of about the same date, the potato is mentioned under the name "battata" or "papa." Hieronymus Cardan, a monk, is supposed to have been the first to introduce it from Peru into Spain, from which country it passed into Italy and thence into Belgium. Carl Sprengel, cited by Professor Edward Morren in his biographical sketch entitled *Charles de l'Escluse, sa Vie et ses Œuvres*, and to which we are indebted for some of the historical details given below, states that the potato was introduced from Santa Fé into England by John Hawkins in 1563 (*Garten Zeitung*, 1805, p. 346). If this be so, it is a question whether the English and not the Spaniards are not entitled to the credit of the first introduction; but, according to Sir Joseph Banks, the plant brought by Drake and Hawkins was not our potato but the SWEET POTATO (see below).

In 1587 or 1588 De l'Escluse, better known under the Latinized appellation of "Clusius," received the plant from Philippe de Sivry, lord of Waldheim and governor of Mons, who in his turn received it from some member of the suite of the papal legate. At the discovery of America, we are told by Humboldt, the plant was cultivated in all the temperate parts of the continent from Chili to New Granada, but not in Mexico. Nearly a hundred years afterwards, in 1585 or 1586, potato tubers were brought from North Carolina and Virginia to Ireland on the return of the colonists sent out by Sir Walter Raleigh, and were first cultivated on Sir Walter's estate near Cork. The tubers introduced under the auspices of Raleigh were thus imported a few years later than those mentioned by Clusius in 1588, which must have been in cultivation in Italy and Spain for some years prior to that time. Be this as it may, the earliest representation of the plant is to be found in Gerard's *Herbal*, published in 1597. The plant is mentioned under the name *Papus orbiculatus* in the first edition of the *Catalogus* of the same author, published in 1596, and again in the second edition, which was dedicated to Sir Walter Raleigh (1599). It is, however, in the *Herbal* that we find the first description of the potato, accompanied by a woodcut sufficiently correct to leave no doubt whatever as to the identity of the plant. In this work (p. 781) it is called "*Battata Virginiana sive Virginianorum, et Pappus, Potatoes of Virginia.*" Gerard says—

"The roote is thicke, fat and tuberous; not much differing either in shape, colour or taste from the common Potatoes, saving that the rootes hereof are not so great nor long; some of them as round as a ball, some ouall or egge-fashion, some longer and others shorter; which knobbie rootes are fastened unto the stalks with an infinite number of threddie strings. . . . It groweth naturally in America where it was first discovered, as reporteth C. Clusius, since which time I have received rootes hereof from Virginia otherwise called Norembeaga which growe and prosper in my garden, as in their owne native cuntry."

The "common Potatoes" of which Gerard speaks are the tubers of *Convolvulus batatas*, the Sweet Potato, which nowadays would not in Great Britain be spoken of as common. Evidently the author attached great importance to the potato, for in the frontispiece to his volume he is represented with the flower and foliage of the plant in his hand. In his opinion it was, like the common potato,

"a foode as also a meate for pleasure equall in goodnesse and wholesomenesse unto the same, being either rosted in the embers, or boiled and eaten with oile, vinegar and pepper, or dressed any other way by the hand of some cunning in cookerie." A second edition of the *Herbal* was published in 1636 by Thomas Johnson, with a different illustration from that given in the first edition, and one which in some respects, as in showing the true nature of the tuber, is superior to the first. The phenomenon of growing out or "super-tuberation" is shown in this cut.

Previous to this (in 1629) Parkinson, the friend and associate of Johnson, had published his *Paradisus*, in which (p. 517) he gives an indifferent figure of the potato under the name of *Papas seu Battatas Virginianorum*, and adds details as to the method of cooking the tubers which seem to indicate that they were still luxuries rather than necessities. Chabræus, who wrote in 1666, tells us that the Peruvians made bread from the tubers, which they called "chunno." He further tells us that by the natives "*Virginieæ insulæ*" the plant was called "openauk," and that it is now known in European gardens, but he makes no mention of its use as an esculent vegetable, and, indeed, includes it among "plantæ malignæ et venenatæ." Heriot (De Bry's *Collection of Voyages*), in his report on Virginia, describes a plant under the same name "with roots as large as a walnut and others much larger; they grow in damp soil, many hanging together as if fixed on ropes; they are good food either boiled or roasted." The plant (which is not a native of Virginia) was probably introduced there in consequence of the intercourse of the early settlers with the Spaniards, who derived the plant from Peru or other parts of South America, and perhaps provisioned their ships with its tubers. In any case the cultivation of the potato in England made but little progress, even though it was strongly urged by the Royal Society in 1663; and not much more than a century has elapsed since its cultivation on a large scale became general.

The source of the potato being known, it is a matter of interest to determine the particular species from which the cultivated forms have descended and the exact part of the great American continent in which it is indigenous. As to the first point, botanists are agreed that the only species in general cultivation in Great Britain is the one which Bauhin, in his *Phytopanax*, p. 89 (1596), called *Solanum tuberosum esculentum*, a name adopted by Linnæus (omitting the last epithet), and employed by all botanical writers. This species is native in Chili, but it is very doubtful if it is truly wild farther north. Mr Baker (*Journal of the Linnean Society*, vol. xx., 1884, p. 489) has reviewed the tuber-bearing species of *Solanum* from a systematic point of view as well as from that of geographical distribution. Out of twenty so-called species he considers six to be really distinct, while the others are merely synonymous or trifling variations. The six admitted tuber-bearing species are *S. tuberosum*, *S. Maglia*, *S. Commersoni*, *S. cardiophyllum*, *S. Jamesii*, and *S. oxycarpum*.

S. tuberosum is, according to Mr Baker, a native not only of the Andes of Chili but also of those of Peru, Bolivia, Ecuador, and Colombia, also of the mountains of Costa Rica, Mexico, and the south-western United States. It seems most probable, however, that some at least of the plants mentioned in the northern part of the American continent have no claim to be considered absolutely wild, but are the descendants of cultivated forms. *S. Maglia* is a native of the Chilian coast as far south as the Chonos Archipelago, and was cultivated in the garden of the Horticultural Society at Chiswick in 1822, being considered by Sabine, in his paper on the native country of the wild potato, to be the true *S. tuberosum* and the origin of the cultivated forms. This species was also found by Darwin in Chili, and was considered by him, as by Sabine before him, to be the wild potato. It is remarkable, says Darwin, that the same plant should be found in the sterile mountains of central Chili, where a drop of rain does not fall for more than six months, and within the damp forests of these

southern (Chonos) islands. The explanation, according to Baker, is that the plant of the dry mountains is *S. tuberosum*, that of the coast is *S. Maglia*. It must, however, be stated that, although Mr Baker refers to the plants figured by Sabine (*Trans. Hort. Soc. Lond.*, vol. v. p. 249) as being without doubt *S. Maglia*, A. de Candolle (*Origine des Plantes cultivées*, p. 40) is equally emphatic in the opinion, "ce qui saute aux yeux," that the plant grown from Chilian tubers and figured in the plate before cited is *S. tuberosum*. *S. Commersoni* occurs in Uruguay, Buenos Ayres, and the Argentine Republic, in rocky situations at a low level. Under the name of *S. Ohrondis* it has lately been introduced into western France, where it is not only hardy but produces abundance of tubers, which are palatable, but have a slightly acid taste. The tubers give promise of improvement under cultivation. *S. cardiophyllum*, described by Lindley in the *Journal of the Horticultural Society*, is a native of the mountains of central Mexico at elevations of 8000 to 9000 feet. *S. Jamesii* is a well-defined species occurring in the mountains of Colorado, New Mexico, and Arizona, and also in Mexico. In a wild state the tubers are not larger than marbles, but as the plant is now in cultivation in England it may be expected to improve in this particular. *S. oxycarpum* is stated by Mr Baker to be a little known but very distinct tuberous species from central Mexico.¹

Mr Baker looks upon the forms enumerated not only with the eye of a systematic botanist but with the tendencies of one whose object is to assign varying forms to one common type from which they have, or may probably have, arisen. But from a practical point of view the forms in question require careful analysis rather than synthesis. Their morphological peculiarities and chemical constitution deserve attentive consideration as to their degree of constancy, and more particularly as to any relation that may be traced between them and the climatic circumstances under which they grow naturally, and their power of resistance to the attacks of disease. A review of the localities in which the presence of *S. tuberosum* and its tuber-bearing allies has been ascertained shows that, broadly, these varieties may be divided into mountainous and littoral. In either case they would not be subjected, at least in their growing season, to the same extremes of heat, cold, and drought as plants growing on inland plains. Again, those forms growing at a high elevation would probably start into growth later in the season than those near the coast. The significance of these facts from a cultural point of view is twofold: for, while a late variety is desirable for culture in Great Britain, as ensuring more or less immunity from spring frost, which would injure the early sorts, it is, on the other hand, undesirable, because late varieties are more liable to be attacked by the potato disease, which as a rule makes its appearance at or about the time when the earliest varieties are ready for lifting, but before the late varieties are matured, and consequently while they are still exposed to the destructive influences of the fungus.

¹ Although these six are the only species admitted as such by Mr Baker, it is well to note some of the forms or varieties, because, although they may not be entitled to specific rank, which after all is a matter of opinion, they may yet be of importance in the future. First of all may be mentioned the *S. tuberosum* of Lindley, differing from the common *S. tuberosum* in not producing tubers. This was found in Chili, and is probably not specifically distinct, although exceptional, for it is by no means very unusual to find even cultivated plants produce no tubers. *S. Fernandezianum* is, according to Baker, a form of *S. tuberosum*, but if so its habitat in the mountain woods of Juan Fernandez is climatically different from that in the dry mountains of central Chili, where, as we have seen, the true *S. tuberosum* grows. *S. oites* was found recently by M. André on the summit of Quindiu in Colombia, at a height of 11,483 feet, in a rigorous climate, only about 3300 feet below the perpetual snows of Tolima. It produces tubers of the size of a nut. *S. Andreanum*, found by M. André at Cauca, at an elevation of 6234 feet, was considered by the traveller to be the true *S. tuberosum*, but this view is not shared by Mr Baker, who named it after the discoverer. Its tubers, if it produces any, have not been seen. *S. immitis* is probably only a slight variety of *S. tuberosum*, as are also the Venezuelan *S. colombianum*, *S. verrucosum*, *S. demissum*, and *S. utile*. *S. Fendleri*, a native of the mountains of New Mexico and Arizona, was considered by Asa Gray to be likewise a form of *S. tuberosum*.

In cultivation¹ the potato varies very greatly not only as to the season of its growth but also as to productiveness, the vigour and luxuriance of its foliage, the presence or relative absence of hairs, the form of the leaves, the size and colour of the flowers, &c. It is probable that a more careful investigation of these peculiarities, and especially of those connected with the microscopical anatomy of the leaves, would give serviceable indications of the varieties most or least susceptible to the disease,—a point at present hardly if at all attended to. As to the tubers, they vary greatly in size, form, and colour; gardeners divide them into rounded forms and long forms or “kidneys”; “lapstones” are more or less flattened; and “pebble” varieties are long potatoes broader at one end than at the other. The colour of the rind, yellowish, brown, or purple, furnishes distinctions, as does the yellow or white colour of the flesh. The colour of the eyes and their prominence or depression are relatively very constant characteristics. These variations have originated chiefly by cross-breeding, but not invariably so, as some varieties rarely, if ever, produce flowers in Britain, and yet “sports” have been observed in their tubers and have become the parents of new varieties. Various methods have been proposed for the prevention or arrest of the ravages of the fungus which causes the “potato disease” (see below). In addition to different modes of cultivation, attempts have been made to secure varieties less liable than others to disease, and, although no great measure of success has been attained, still the matter is not without promise, seeing how the early varieties, as before stated, escape the full virulence of the malady. Other attempts have been made to infuse a hardier constitution by hybridizing the potato with hardy species such as *S. Dulcamara* and *S. nigrum*. Hybrids were accordingly raised by Mr Maule, but they all suffered from the disease as much as the parents, and it is to be feared that the hybrids raised between the common potatoes and some of the six species mentioned by Mr Baker may suffer a like fate. This, however, remains to be proved. Mr Maule, disappointed with his hybridization experiments, then tried the effect of grafting. With this view he grafted *S. nigrum* on to a shoot of the potato. New tubers were formed, the foliage being wholly that of *S. nigrum*. In another experiment he grafted the potato on to *S. Dulcamara*. In one case tubers were produced on the graft (the potato), out none on the *Dulcamara* stock, either above or below ground, while in another case tubers were actually produced on the underground portions of *S. Dulcamara*. Mr Maule's experiments were most ingenious, but the theory he gave in his *The Potato, what is it?* (Bristol, 1876) will not commend itself to physiologists, and there is no evidence to show whether the grafts he obtained were attacked by the parasite or even whether they had a chance of being so. Mr Maule's experiments, especially the one last mentioned, afford confirmation of the possibility of graft hybridization being effected. Various experimenters, especially Mr Fenn, have asserted that by engrafting an eye of one variety into the tuber of another, not only will adhesion take place but the new tubers will present great variety of character; and this indeed seems to be the case from the numerous specimens shown by Mr Fenn at the Royal Horticultural Society, but it can hardly be considered as established that the variations in question were the result of any commingling of the essences of the two varieties. The wound may simply have set up that variation in the buds the occasional existence of which has been already noted. The last-cited experiment of Mr Maule's, however, is much more conclusive. Mr A. Dean also (*Gardeners' Chronicle*, 2d September 1876, p. 304)

¹ See HORTICULTURE, vol. xii. p. 286.

succeeded in grafting the potato on to the tomato, with the result that, although no tubers were found on the root of the tomato, numerous tubers were produced on the sides of the branches of the potato. Another experiment may be here mentioned as throwing light on the formation of tubers, one wherein Mr Burbidge observed the production of tubers at the portion of an ordinary cutting of *S. Comersoni* inserted in the soil. In this case no tubers were formed above ground. (M. T. M.)

POTATO DISEASE.

There are few agricultural subjects of greater importance than the culture of the potato and the losses entailed by potato disease. The number of acres in Great Britain alone under cultivation for potatoes is generally more than half a million (543,455 in 1883, 562,344 in 1884); the average weight of the produce per acre may be taken at five tons, the average price about £5 per ton, so that the commercial value of each year's crop commonly ranges between £13,000,000 and £15,000,000. It is not unusual in bad seasons for a single grower to lose from £1000 to £1500 through disease; for the market grower sometimes not only loses the entire produce, or nearly so, but loses also the value of the seed, the guano, the farm-yard manure, the rent, and the labour. Growers sometimes lose £30 per acre in one season, for, exclusive of the diseased produce, £10 may be put down to guano and dung, £4, 10s. to rent, tithes, and taxes, £6, 10s. for seed, and £2 for digging; added to this there are ploughing, harrowing, overlooking, earthing up, sacks, carriage to and fro, and many minor expenses. The losses range in amount according to the virulence and general extent of the disease. In extreme cases every tuber is lost, as the produce will not even pay the cost of lifting. The year of the great potato famine in Britain was 1845, but the Rev. M. J. Berkeley, in his famous essay on the potato murrain published by the Royal Horticultural Society of England in 1846, stated that a very serious disease of the potato named the “curl” had at that time been known in Britain for more than half a century. We now know that the “curl” is a condition of the true potato murrain. As a rule, although there are a few exceptions, the disease occurs wherever the potato is grown. It is known in South America, in the home of the potato plant.

The disease of potatoes is caused by the growth of a fungus named *Peronospora infestans*, Mont., within the tissues of the host plant, and this fungus has the peculiar property of piercing and breaking up the cellular tissues, and setting up putrescence in the course of its growth. The parasite, which has a somewhat restricted range of host plants, chiefly invades the potato, *Solanum tuberosum*, L.; the bittersweet, *S. Dulcamara*, L.; *S. demissum*, Lind.; and *S. cardiophyllum*, Lind. It is also very destructive to the tomato, *Lycopersicum esculentum*, Mill., and to all or nearly all the other species of *Lycopersicum*. At times it attacks petunias and even Scrophulariaceous plants, as *Anthocersis* and *Schizanthus*. A second species of *Peronospora* is known on Solanaceous plants, viz., *P. Hyoscyami*, D. By., a parasite of the common henbane.

In England the disease is generally first seen during the last ten days of July; its extension is greatly favoured by the warm and showery weather peculiar to that period of the year, and according as the warm and humid weather of autumn is late or early the murrain varies a little in its time of appearance. To the unaided eye the disease is seen as purplish brown or blackish blotches of various sizes, at first on the tips and edges of the leaves, and ultimately upon the leaf-stalks and the larger stems. On gathering the foliage for examination, especially in humid weather, these dark blotches are seen to be putrid,

and when the disease takes a bad form the dying leaves give out a highly offensive odour. The fungus, which is chiefly within the leaves and stems, seldom emerges through the firm upper surface of the leaf; it commonly appears as a white bloom or mildew on the circumference of the disease-patches on the under surface. It grows within the tissues from central spots towards an ever-extending circumference, carrying putrescence in its course. As the patches extend in size by the growth of the fungus they at length become confluent, and so the leaves are destroyed and an end is put to one of the chief vital functions of the host plant. On the destruction of the leaves the fungus either descends the stem by the interior or the spores are washed by the rain to the tubers in the ground. In either case the tubers are reached by the fungus or its spores, and so become diseased. The fungus which undoubtedly causes the mischief is very small in size, and under the microscope appears slightly whitish or colourless. The highest powers are required to see all parts of the parasite.

The accompanying illustration, drawn from nature, shows the habit and structure of the fungus, *Peronospora infestans*, Mont. The letters A B show a vertical section through a fragment of a

Peronospora infestans, Mont.—Fungus of Potato Disease.

potato leaf, enlarged 100 diameters; A is the upper surface line, and B the lower; the lower surface of the leaf is shown at the top, the better to exhibit the nature of the fungus growths. Between A and B the loose cellular tissue of which the leaf is partly built up is seen in section, and at C the vertical palisade cells which give firmness to the upper surface of the leaf. Amongst the minute spherical cells within the substance of the leaf numerous transparent threads are shown; these are the mycelial threads or spawn of the fungus; wherever they touch the leaf-cells they pierce or break down the tissue, and so set up decomposition, as indicated by the darker shading. The lower surface of the potato leaf is furnished with numerous organs of transpiration or stomata, which are narrow orifices opening into the leaf and from which moisture is transpired in the form of fine vapour. Out of these small openings the fungus threads emerge, as shown at D, D, D. When the threads reach the air they branch in a tree-like manner, and each branch carries one or more ovate reproductive bodies termed "spores" or "conidia," bodies roughly comparable with seeds, as shown at E, E, E. Sometimes other reproductive bodies roughly comparable with the anthers and pistils of flowering plants are borne inside the leaf, stem, or tuber, as at F; the larger body of these is female, and is termed an "oogonium," and the smaller, which at length pierces the oogonium, is male, and is termed an

"antheridium." When the spores or conidia are magnified 400 diameters they are seen as at F, and the contained protoplasm often breaks up into a definite number of parts, as at G. When a spore like F germinates it protrudes an ameba-like mass of protoplasm, as shown at H, which is capable of reproducing the potato fungus at once; and when a differentiated conidium as at G germinates it expels about eight minute mobile bodies called "zoospores," each zoospore being furnished with two extremely attenuated vibrating hairs termed "cilia," as shown at J. These zoospores swim about in any film of moisture, and on going to rest take a spherical form, germinate, and produce threads of mycelium as at K; the mycelium from the germinating conidia or zoospores soon finds its way into the tissues of the potato leaf by the organs of transpiration, and the process of growth already described is repeated over and over again till the entire potato leaf, or indeed the whole plant, is reduced to putridity.

The oogonium and antheridium as seen at F are further enlarged to 400 diameters at L; it will here be seen that the smaller male organ or antheridium has projected a fine beak through the walls of the oogonium or female organism; through this beak some of the protoplasm from the antheridium passes into and mingles with the protoplasm of the oogonium; this is the act of fertilization, and an oospore or resting spore (M, N), a body roughly comparable with a seed, is the result. After fertilization the oospores quickly drop from their supporting threads and become free like most ripe fruits. As the potato fungus causes the potato to become putrid the mature oospores or resting spores are necessarily confined to the portions of the potato plant which have been destroyed by the fungus, *i.e.*, either to the decayed leaves or stems or to the diseased tubers; they are brown in colour and generally more or less spinulose or warted. They will not germinate till after a rest of nine, ten, or twelve months, or in some instances even two years. They germinate by protruding threads, which speedily bear spores or conidia as at E, or more rarely zoospores as at J. The resting spores were seen by Dr Rayer and Dr Montague in 1845, and named (in ignorance of their true nature) *Artotrogus hydnosporus*. The Rev. M. J. Berkeley shortly afterwards identified them as the resting spores of the potato fungus; but they were not seen by any one between the years 1845 and 1875, when in the latter year they were discovered in great abundance and artificially produced from the potato fungus by the writer of this article. At first believed to be rare, they are now known to be amongst the commonest of vegetable productions. The potato fungus is easily made to produce resting spores, and their germination after a year's rest is an observation of no special difficulty. At one time these resting spores were confused by some botanists with a little fugitive transparent fungus, bearing oogonia not half the size of the oogonia of *Peronospora infestans*, and named *Pythium vexans*, D. By.; the latter plant perfects itself in twenty-four hours or at most a day or two, instead of taking a year or more as do the resting spores of the fungus of the potato disease. *Pythium vexans* has no connexion whatever with the fungus or the potato disease.

The germinating conidia of the potato fungus, as at E, are not only able to pierce the leaves and stems of the potato plant, and so gain an entry to its interior through the epidermis, but they are also able to pierce the bark of the tuber, especially in young examples. It is therefore obvious that, if the tubers are exposed to the air where they are liable to become slightly cracked by the sun, wind, hail, and rain, and injured by small animals and insects, the spores from the leaves will drop on to the tubers, quickly germinate upon the slightly-injured places, and cause the potatoes to become diseased. Earthing up therefore prevents these injuries, but where practised to an immoderate extent it materially reduces the produce of tubers. The labour entailed in repeated earthing up is also considered a serious objection to its general adoption.

All diseased potato material should be gathered together and either deeply buried or burnt, as the hibernating germs of the disease (oospores) rest in the decaying potato refuse, and the mycelium itself sometimes hibernates.

See Berkeley's essay, "On the Potato Disease," in *Journal of the Royal Horticultural Society*, vol. i., 1846; Professor A. de Bary, "On the Nature of the Potato Fungus," in *Journal of Royal Agricultural Society*, vol. xii., 1876; Earl Cathcart, "The Cultivated Potato," in *Journal of Roy. Agr. Soc.*, 1884; J. G. Baker, "The Tuber-bearing Species of *Solanum*," in *Journal of the Linnean Society*, vol. xx., 1884; and Worthington G. Smith, *Diseases of Field and Garden Crops* (1884). In the latter work a full bibliography is given. (W. G. SM.)

POTATO, SWEET. This plant (the *Convolvulus batatas*, or *Ipomoea batatas* of some authors) is generally cultivated in the West Indies and most tropical countries for the sake of its tuberous root, which is an article of diet greatly in request. It is a climbing perennial with cordate, entire, or palmately-lobed leaves borne on slender twining stems. The flowers are borne on long stalks in loose clusters or cymes, and have a white or rosy funnel-shaped corolla like that of the common bindweed of English hedges. The edible portion is the root, which dilates into

large club-shaped masses filled with starch. It is ill suited to the climate of the United Kingdom, but in tropical countries it is as valuable as the potato is in higher latitudes. The plant is not known in a truly wild state, nor has its origin been ascertained. A. de Candolle concludes that it is in all probability of American origin, though dispersed in Japan, China, the South Sea Islands, Australia, &c. Its migrations are only explained by him on geological grounds of an entirely hypothetical character. It is mentioned by Gerard as the "potato," or "potatus," or "potades" in contradistinction to the "potatoes" of Virginia (*Solanum tuberosum*). He grew it in his garden, but the climate was not warm enough to allow it to flower, and in winter it perished and rotted. But as the appellation "common" is applied to them the roots must have been introduced commonly. Gerard tells us he bought those that he planted at "the Exchange in London," and he gives an interesting account of the uses to which they were put, the manner in which they were prepared as "sweetmeats," and the invigorating properties assigned to them. The allusions in the *Merry Wives of Windsor* and other of Shakespeare's plays in all probability refer to this plant, and not to what we now call the "potato."

POTATO BEETLE or **COLORADO BEETLE**. See **COLEOPTERA** (*Doryphora decemlineata*), vol. vi. p. 134.

POTEMKIN, **GREGORY ALEXANDROVICH** (1739-1791), Russian soldier and statesman, was born in 1739 in the village of Domnovo, in the government of Smolensk. His father was a poor nobleman of Polish extraction, but the family had been settled for some time in Russia. Owing to the slender means of his parents, Potemkin's first plan seems to have been to devote himself to the church; but he did not show much inclination for this profession, and eventually embraced the calling of a soldier. His fortunes rose from the time when he assisted the empress Catherine in her conspiracy against her husband on the memorable 10th of July 1762. On this occasion, when Catherine rode through the ranks, Potemkin, perceiving that she had no plume in her hat, offered her his own. Soon afterwards he became one of the leading favourites and his rise was rapid. We first find him serving under Marshal Roumantzoff against the Turks, but, after having spent some time in the camp, he returned to St Petersburg, where he became more influential than ever. From 1778 till his death the foreign policy of Russia was almost entirely in his hands. By his agency the Crimea was annexed in 1783, the khan being induced to put himself under Russian protection. In January 1787 the empress set out with Potemkin to survey her new conquests. The description of this journey and of the fantastic luxury which accompanied it has been often given, and need not be recapitulated here. At Kherson Catherine was met by the emperor Joseph, who had travelled from Austria for that purpose. She there passed under a triumphal arch, on which was inscribed, in Greek letters, "The way to Byzantium." The empress went as far south as Bakhchisarai and Stari Krim, at which point she turned back, reaching St Petersburg on the 22d of July. Soon afterwards war was declared against Turkey and the siege of Otchakoff commenced in July 1788. Here Potemkin acted as commander-in-chief, with 150,000 men at his disposal, but it is difficult to say if he had any talent as a soldier, as many able men, among others Souwaroff, served under him, and he was able to appropriate the fruits of their labour and ability. According to some he showed military genius, according to others he was entirely destitute of it. He is said to have introduced some very useful changes in the dress and discipline of the Russian armies. Otchakoff was taken in December 1788, with terrible slaughter on both sides, and was followed by the victories of Souwaroff at Bender and Ismail,

the latter of which was taken in 1790, when Souwaroff sent his celebrated couplet to Catherine:

"Slava Bogu! Slava Vam!
Krepost vsiata i ya tam!"¹

In March 1791 Potemkin made his triumphal entry into St Petersburg. The description of the banquet which he gave in honour of the empress at his Taurian palace rivals any scene of Oriental magnificence. But his constitution was now breaking; his body at a comparatively early age was worn out by his labours and excesses. Yet he refused to have recourse to medicine, lived upon salt meat and raw turnips, and drank strong wines and spirits. In the latter part of the year 1791 he went to the south of Russia, the scene of his former triumphs, and lay ill for some time at Jassy, whence he attempted to move to Otchakoff, but after travelling a few versts he could no longer endure the motion of the carriage. He accordingly was lifted out and a carpet was spread for him at the foot of a tree, upon which he soon expired in the arms of his niece, Countess Branicka, on the 15th of October 1791. His body was interred at Kherson, but, from inquiries made on the spot by the traveller Edward Clarke at the commencement of the present century, it seems to have been disinterred and thrown into a ditch by order of the emperor Paul, who hated him.

During his lifetime Potemkin did not escape the censure of his countrymen, in proof of which may be cited the attacks of Derzhavin and Radistcheff. Strange stories are told of his extravagance and whimsicality, among others that he had in his library several volumes of bank notes bound together. He seems to have "sickened of a vague disease" in the midst of all his splendour. His wealth was boundless, as, besides his personal property, he had large landed estates and many thousands of serfs. He was arrogant and capricious, a thorough despot, and a man of grossly licentious life. That he was possessed of some ability cannot be doubted, but, taking him all in all, we must say that the prominence of a man of such character has left a deep stain upon the annals of Russia.

POTENZA, a city of Italy, the chief town of Potenza (Basilicata), lies in the heart of the country, on an isolated hill in the valley of the Basento or Busento (Casuentus or Masuentum), 69 miles by rail east of Salerno and 51 west-north-west of Metapontum, where the Basento reaches the Gulf of Taranto and the railway joins the line between Taranto and Reggio. It is much exposed to stormy winds, and has in general a far more northern climate than its astronomical position (40° 40' N. lat.) implies. Along with Marsico Nuovo the city forms an episcopal diocese dependent on Acerenza, and under the Bourbon Government it was considered a fortified place of the fourth class. The buildings of chief note are the cathedral, the seminary, and the hospital of San Carlo (1869). The population was 18,295 in 1871 and 16,968 in 1881 (commune, 20,281).

The hill on which Potenza now stands was originally occupied only by the citadel of the ancient Potentia, which spread out in the valley below, and must have been, to judge by its numerous inscriptions, a flourishing municipium during the Roman empire. The old town was destroyed by Frederick II., and again by earthquake in 1273; the erection of the new town on the hill probably dates from this latter event. By the Angevines Potenza was made a domain of the San Severino family; in the beginning of the 15th century it was held by Francesco Sforza, and in 1435 it passed to the Guevara family; the Loffredi, who succeeded by marriage, continued in possession till the abolition of the great fiefs. In 1694 there was a severe earthquake; and the more terrible earthquake which on 16th and 17th December 1857 passed through southern Italy, and in the Basilicata alone killed 32,475 persons, proved particularly disastrous at Potenza, laying the greater part of the city in ruins.

POTI, a seaport town of Trans-Caucasia in the government of Kutais (Mingrelia), lies at the mouth of the Rhion (Phasis) on the coast of the Black Sea, 193 miles west-north-west of Tiflis, with which it is connected by a railway

¹ Glory to God! glory to you!
The fortress is taken and I am there.

opened (except the tunnel of Suram) in 1872. The white walls of the fortress may be seen at a great distance contrasting with the green trees which surround them, and the lighthouse, 117 feet high, is visible 17 miles. Situated in a low and marshy delta not more than $2\frac{1}{2}$ feet above the level of the river, Poti is extremely unhealthy, fever and ague prevailing in summer and autumn. Ever since the Russians obtained possession of the place they have laboured to improve the town and port, but with comparatively limited success. The houses are built of wood and supported on piles. After Batoum was transferred to Russia in 1878 it was thought that Poti would be abandoned as a port, but the Commission of Inquiry appointed in 1883 decided in its favour. Works estimated to cost 2,365,000 roubles and to be finished in four years were accordingly undertaken. The population of the town is given as 3112 in the Russian *Calendar* for 1882.

Poti represents the ancient Phasis, a commercial colony of the people of Miletus. The present fortress was built in 1578 by Amurath III. at the time of the war with Persia. In 1640 it was destroyed by the Imeritians, but it was again restored and enlarged, the ancient ruins in the neighbourhood yielding the necessary material. The town was a great market for the trade in slaves. It was captured by the Russians in 1812, and again in 1829.

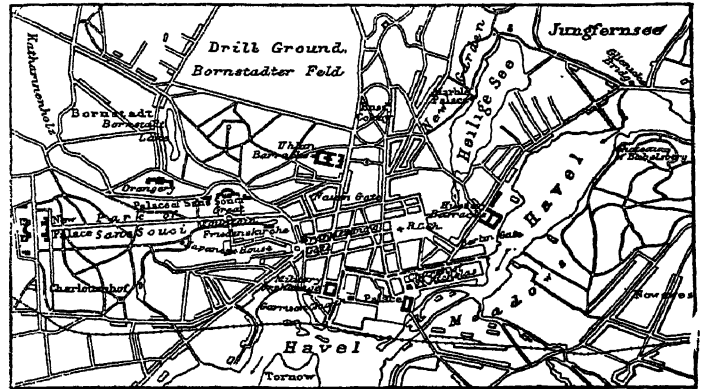

POTOMAC, a river of the United States, which joins Chesapeake Bay by a considerable estuary after a course of about 400 miles. The northern branch of the upper river rises in the Alleghanies, West Virginia, the southern in the Shenandoah Mountains. Affluents are received from Pennsylvania, Maryland, Virginia, and West Virginia,—the most important of all being the Shenandoah, which joins it at Harper's Ferry, below which the united stream breaks through the line of the Blue Ridge. Ships ascend for a short distance above Washington (the capital of the United States), or a total distance from the sea of 125 miles.

POTOSI (not to be confounded with San Luis Potosi, the state and state capital in Mexico) is a town of Bolivia, at the head of the department of Potosi, in $19^{\circ} 36'$ S. lat. and $65^{\circ} 46'$ W. long. It stands in a bleak and barren country not far from the sources of the Pilcomaya, and thus belongs to the great basin of the La Plata system. Situated at the height of about 13,280 feet above the sea, it is one of the highest inhabited places in the world, and the Cerro de Potosi,¹ at the foot of which it stands, reaches a height of 16,150 feet. The wealth of silver ore drawn from it up to 1846 is stated at upwards of £300,000,000 sterling; and, though the works had for a time to be discontinued as heavier machinery and greater capital were required, the store is far from being exhausted. The city is still the seat of the national mint. It consists of nine streets about 30 feet broad, running north and south and crossed at right angles by others of varying breadth. The houses (two-storied in the heart of the town, but only of one story in the outskirts) are built of adobe and white-washed. Besides the cathedral (restored in 1858) there are a large number of churches, several convents, and other public buildings; but the city as a whole has that dilapidated and melancholy appearance which is the result of a greatly diminished population. In 1611 its inhabitants are said to have numbered 160,000; at present they are probably not more than 11,000, though Hugo Reck about 1867 gave 22,850 and Ondarza in 1882 repeated exactly the same figures.

The foundation of the town dates from 1547, two years after the first discovery of silver ore on Cerro de Potosi. In 1825 a monument to Bolivar was erected in the public square. The history of Potosi from its origin till 1702 will be found in Don Vicente Ballivian y Rojas's *Bolivian Archives*.

POTSDAM, the seat of government for the Prussian province of Brandenburg, and the summer residence of the emperor of Germany, lies 16 miles to the south-west of

Berlin, on the river Havel, which here expands into a series of small lakes. The town is handsomely built, though with a monotonous regularity that betrays its artificial origin, and is situated amid the prettiest scenery of the Mark of Brandenburg, consisting of an oasis of wood and hill and lake in the centre of a sandy and unattractive plain. Except during the summer months, when its streets are enlivened by endless streams of excursionists from Berlin, Potsdam usually presents a somewhat dull and deserted scene, relieved only by the soldiers of

Potsdam.

its extensive garrison. The greater part of the town lies on the right bank of the Havel and is connected with the Teltow suburb on the opposite bank by a long bridge. At the north end of this bridge rises the royal palace, a large quadrangular building of the 17th century, with a colonnade, chiefly interesting for the numerous relics it contains of Frederick the Great, who made it his favourite residence. It also contains reminiscences of Voltaire, who also resided here for several years. The principal churches are the Nicolaikirche, a handsome edifice with a dome; the garrison church, containing the remains of Frederick the Great and his father; and the Friedenskirche or church of peace, erected by Frederick William IV. as a "positive and Christian counterpart to the worldly negative of Sans Souci." Among other conspicuous buildings are the large barracks, orphanages, and other military establishments; the town-house; the district courts; the theatre; and the Brandenburg gate, in the style of a Roman triumphal arch. The Lustgarten, Wilhelmsplatz, and Plantage are open spaces laid out as pleasure-grounds and adorned with statues and busts. In spite of its somewhat sleepy appearance, Potsdam is the seat of a varied if not very extensive industry, of which sugar, cotton and woollen goods, chocolate, and tobacco are the chief products. Market-gardening affords occupation to many of the inhabitants, and the cultivation of winter violets is important enough to be mentioned as a specialty. The Havel is well stocked with fish. In 1880 Potsdam contained 48,447 inhabitants, mainly Protestant. The garrison consists of about 7000 men.

Potsdam is almost entirely surrounded by a fringe of royal palaces, parks, and pleasure-grounds, which fairly substantiate its claim to the title of a "German Versailles." Immediately to the west is the park of Sans Souci, laid out by Frederick the Great, and largely extended by Frederick William IV. It is in the formal French style of the period, and is profusely embellished with primly-cut hedges and alleys, terraces, fountains, statuary, and artificial ruins. Adjacent to the palace is the famous windmill (now royal property) which its owner refused to sell to the king, meeting threatened violence by an appeal to the judges of Berlin; the whole story, however, is now doubted. A little farther on is the so-called Orangery,

¹ For a description of this mountain, see BOLIVIA (vol. iv. p. 13).

an extensive edifice in the Italian style, containing numerous pictures and other works of art. The park also includes the Charlottenhof, a reproduction of a Pompeian villa. At the west end of the park stands the New Palace, a huge brick edifice 375 feet in length, erected by Frederick the Great at enormous expense in 1763-69, and now occupied by the crown prince of Germany. It contains other reminiscences of Frederick and Voltaire, a few pictures by ancient masters, a theatre, and a large hall gorgeously decorated with shells and minerals. The spacious buildings at the back are devoted to the "Lehrbataillon," a battalion of infantry composed of draughts from different regiments trained here to ensure uniformity of drill throughout the army. To the north of Potsdam lies a small Russian village, established in 1826 to accommodate the Russian singers attached to the Prussian guards. A little to the east of it is the New Garden, containing the Marble Palace. The list of Potsdam palaces may be closed with two situated on the left bank of the Havel—one at Glienicke and the other on the hill of Babelsberg. The latter, a picturesque building in the English Gothic style, in the midst of a park also in the English taste, is the summer residence of the present emperor of Germany.

Potsdam was originally a Slavonic fishing-village named Potsdumipi, and is first mentioned in a document of 993. It did not, however, attain any importance until the Great Elector established a park and palace here about 1660; and even at the close of his reign it only contained 3000 inhabitants. Frederick William I. (1688-1740) greatly enlarged Potsdam, and his stiff military tastes are reflected in the monotonous uniformity of the streets. Frederick the Great willingly continued his father's work, and is the real creator of the modern splendour of the town, of which his memory may be said to form the predominant interest. His successors have each contributed his quota towards the embellishment and extension of the town.

POTTER, JOHN (c. 1674-1747), archbishop of Canterbury, was the son of a linen-draper at Wakefield, Yorkshire, and was born about 1674. At the age of fourteen he entered University College, Oxford, and in 1693 he published, at the suggestion of the master of his college, various readings and notes on Plutarch's *De audiendis poetis* and Basil's *Oratio ad juvenes*. In 1694 he became a fellow of Lincoln College, and in 1697 his edition of Lycophrone appeared. It was followed by his *Archæologia Græca* (2 vols. 8vo, 1697-99), once a very popular work. A reprint of his Lycophrone in 1702 was dedicated to

Grævius, and the *Antiquities* was afterwards published in Latin in the *Thesaurus* of Gronovius. In 1704 he became chaplain to Archbishop Tenison, and shortly afterwards was made chaplain-in-ordinary to Queen Anne. From 1708 he was regius professor of divinity and canon of Christ Church, Oxford; and from 1715 he was bishop of Oxford. In the latter year appeared his edition of Clemens Alexandrinus (frequently reprinted and still valued). In 1707 he published a *Discourse on Church Government*, and he took a prominent part in the controversy with Hoadly, bishop of Bangor, being complimented by that author as the antagonist of whom he was most afraid. In January 1737 Potter was unexpectedly appointed to succeed Wake in the see of Canterbury. His primacy was in no way remarkable, but had the effect of checking the movement for revision of the formularies and confessions of the church and of the subscription to them. He died on 10th October 1747. His *Theological Works*, consisting of sermons, charges, divinity lectures, and the *Discourse on Church Government*, were published in 3 vols. 8vo, in 1753.

POTTER, PAUL (1625-1654), animal painter, was born at Enkhuizen, Holland, in 1625. He was instructed in art by his father, Peter Potter, a landscape and figure painter of some merit, and by the time he had attained his fifteenth year his productions were already much esteemed. At the age of twenty he settled at The Hague, and there married in 1650. He was patronized by Maurice, prince of Orange, for whom he painted the life-size picture of the Young Bull, now one of the most celebrated works in the gallery of The Hague. In 1652 he was induced by Burgomaster Tulk of Amsterdam to remove to that city. The constitution of the painter seems to have been feeble, and his health suffered from the unremitting diligence with which he pursued his art. He died in 1654 at the early age of twenty-nine.

His paintings are generally on a small scale; his animals are designed with a careful accuracy which bears witness to the artist's close and constant study from nature; while the landscape backgrounds are introduced with spirit and appropriateness. His colour is clear and transparent, his execution firm and finished without being laboured. He executed a series of some twenty etchings, mainly of animals, which are simple and direct in method and handling. Here, as in painting, his precocity was remarkable; his large plate of the Herdsman, produced when he was only eighteen, and that of the Shepherd, which dates from the following year, show him at his best as an accomplished master of the point.

P O T T E R Y A N D P O R C E L A I N

Plate V. **T**HE word "pottery" (Fr. *poterie*) in its widest sense includes all objects made of clay, moulded into form while in a moist plastic state, and then hardened by fire. Clay, the most widely spread and abundant of all mineral substances, consists essentially of a hydrated silicate of alumina (see vol. x. p. 237), admixed, however, in almost all cases with various impurities. Thus it usually contains a considerable proportion of free silica, lime, and oxides of iron, its colour chiefly depending on the last ingredient. The white kaolin clays (see KAOLIN) used in the manufacture of porcelain are the purest; they consist of silicate of alumina, with 5 to 7 per cent. of potash, and only traces of lime, iron, and magnesia.

The making of pottery depends on the chemical change that takes place when clay is heated in the fire; the hydrated silicate of alumina becomes anhydrous, and, though the baked vessel can absorb mechanically a large quantity of water, the chemical state, and with it the hardness of the vessel, remains unaltered. A well-baked piece of clay is the most durable of all manufactured substances. In preparing clay for the potter it is above all things necessary that it should be worked and beaten, with suffi-

cient water to make it plastic, into a perfectly homogeneous mass. Any inequalities cause an irregular expansion during the firing, and the pot cracks or flies to pieces. In early times the clay was prepared by being kneaded by the hands or trampled by the feet (see Isa. xli. 25); modern manufacturers prepare it on a larger scale by grinding it between mill-stones, and mixing it in a fluid state with an additional quantity of silica, lime, and other substances.

During the process of firing all clays shrink in volume, partly through the loss of water and partly on account of increase of density. What are called "fat" clays—those, that is to say, which are very plastic and unctuous—shrink very much, losing from one-third to one-fourth of their bulk; they are also very liable to crack or twist during the firing. "Lean" clays—those that have a large percentage of free silica—shrink but little, and keep their form unaltered under the heat of the kiln; they are not, however, so easy to mould into the required shape, and thus a certain compromise is frequently required. Lean and fat clays are mixed together, or silica (sand or ground and calcined flints) is added to a fat clay in sufficient quantity to enable it to stand the firing. The same result may be attained

AMPHORA COMPLETE.

AMPHORA FROM CAMIRUS, RHODES. (THETIS AND PELEUS.)

by the addition of broken pots, crushed or ground, an expedient practised during the earliest stages of the development of the art of pottery.

Classification.

Classification.—Many attempts have been made to classify pottery and porcelain according to their mode of manufacture. The classification of M. Brongniart (*Traité des Arts Céramiques*, Paris, 1854) has been followed by most later writers. With some modifications it is as follows:—

- | | |
|--|---|
| 1. Soft pottery, easily fusible. | (a) <i>Biscuit.</i> —Simple baked clay, porous and without gloss. Example, a common modern flower-pot. |
| | (b) <i>Glossy.</i> —Fine clay covered with an almost imperceptible vitreous glaze. Example, most Greek vases. |
| | (c) <i>Glazed.</i> —Clay covered with a perceptible coating of glass. Example, common white earthenware plates. |
| | (d) <i>Enamelled.</i> —Clay covered with a vitreous coating made opaque by white oxide of tin. Example, Italian majolica. |
| 2. Stoneware, very hard and infusible. | (a) Very silicious clay covered with a lead vitreous glaze. Example, old grey Flemish ware. |
| | (b) Silicious clay covered with a salt glaze. Example, a modern brown ginger-beer bottle. |
| 3. Porcelain, white, semi-transparent, and only fused at a high temperature. | (a) <i>Hard Porcelain.</i> —Natural kaolinic clay covered with a felspar glaze. Example, porcelain of China and Japan. |
| | (b) <i>Soft Porcelain.</i> —Artificial paste covered with a lead vitreous glaze. Example, early Sèvres porcelain. |

This classification is necessarily imperfect, some pottery coming under two heads, as, for instance, much of the Italian majolica, which is both enamelled and glazed. For this reason in the following article pottery will be treated according to its age and country, not according to its method of manufacture. Porcelain differs from pottery in being whiter, harder, less fusible, and (most essential difference) in being slightly translucent. The paste of which it is formed is a purer silicate of alumina than the clay of which pottery is made. It will therefore be described under separate heads (p. 633 *sq.*, *infra*).

Technical terms.

For the sake of clearness it will be well to define the sense in which technical words relating to pottery are used in this article. *Body* or *paste* is the clay of which the main bulk of a pot is made. *Slip* is clay finely ground and mixed with water to the consistency of cream. It is usually applied over the whole surface of a vessel in order to give it a finer face or a different colour from that of the body of the pot. It is also sometimes applied partially, forming ornaments in relief, as in the case of some Roman ware and the coarse 17th-century pottery of Staffordshire described below. *Glaze* is a thin coating of glass, evenly fused over the surface of a clay vessel to make it harder, and also to render it impervious to water. Clay simply baked without a vitreous coating is called *biscuit*; its surface is dull, and it is more or less porous. The simplest and oldest form of glaze is a pure silicate of soda; the addition of oxide of lead makes the glaze more fusible, but less hard and durable. For decorative purposes glazes may be coloured by various metallic oxides without losing their transparency. *Enamel* is a glaze with the addition of some substance to render it opaque. Binoxide of tin has the peculiar property that when even a small quantity is added to a transparent glass it renders it opaque and white without otherwise altering its character. Great confusion has been caused in various works on pottery by a careless use of the terms "glaze" and "enamel"; they are both of the nature of glass, but the best distinction to make is to apply the word "enamel" to a vitreous coating that is *opaque*, and the word "glaze" to one that is *transparent*; both may be coloured. The method of applying

vitreous coatings to clay, whether enamel or glaze, is this. The materials are ground fine and mixed with water to the consistency of cream. The pot is dipped in the mixture, or the fluid is applied with a brush; it is then set to dry, and finally fired in the kiln, which must be heated sufficiently to fuse the component parts of the glaze or enamel into one smooth vitreous coating, while on the other hand it must not be hot enough to soften or melt the clay body of the vessel. The use of oxide of lead enables a glaze to be applied to a clay body which would not stand the high temperature necessary to combine and fuse a pure silico-alkaline glaze. In order to prevent the glaze or enamel from blistering or cracking off there must be a certain similarity of substance between the clay body and the vitreous coating. A fine silicious glaze or enamel will not adhere to a soft fat clay unless the proportion of silica in the latter is increased either by admixture of a harder, more silicious clay, or by the addition of pure silica either in the form of sand or of ground flint.

The Potter's Wheel.—All pottery, except the rudest and Potter's most primitive sorts, is moulded or "thrown" by the aid wheel.

of a very simple contrivance, a small round table fixed on a revolving pivot. Fig. 1, from a tomb-painting at Thebes, shows its simplest form.

The potter at intervals gives a spin to the table, which continues to revolve for some time without a fresh impulse. This form of wheel, used by the Egyptians (as is shown by existing fragments of pottery) about 4000 B.C., is still employed without any alteration by the potters of many parts of India. A later improvement introduced in Egypt under the Ptolemies was to have another larger circular table, fixed lower down on the same axis, which the potter set in movement with his feet, and thus was able to keep up a regular speed and leave his hands free for the manipulation of the clay (see fig. 2). No process in any handicraft is more beautiful than that of a potter moulding a vessel on the wheel.

FIG. 1.—Potter moulding a vessel on the wheel, from a painting in a tomb at Thebes about 1800 B.C. Compare the wheel on the left in fig. 55.

The ease with which the plastic clay answers to the touch of the hand, and rises or falls, taking a whole succession of symmetrical shapes, and seeming, as it were, instinct with the life and thought of the potter, makes this art beautiful and striking beyond all others, in which the desired form can only be attained by comparatively slow and laborious methods. Ancient poetry is full of allusions to this. Homer (*Il.*, xviii. 600) compares the rhythm of a dance to the measured spin of a potter's wheel; and the rapid ease with which a clay vessel is made and remade in a new form is described by Jeremiah (xviii. 3-4) in one of his most forcible similes (compare Horace, *A. P.*, 21-22). Among the Egyptians of the Ptolemaic period the potter was used as a type of the Creator. Nouf or Knoum, the divine spirit, and Pthah, the creator of the mundane egg, are symbolized by human figures moulding clay on the potter's wheel.¹ The wheel and egg are shown above in fig. 2.

FIG. 2.—Potter's wheel of the time of the Ptolemies, moved by the foot, from a wall-relief at Philæ. Compare fig. 55, the wheel on the right.

Among the Egyptians of the Ptolemaic period the potter was used as a type of the Creator. Nouf or Knoum, the divine spirit, and Pthah, the creator of the mundane egg, are symbolized by human figures moulding clay on the potter's wheel.¹ The wheel and egg are shown above in fig. 2.

Kilns.

Kilns for firing Pottery.—The earliest form of kiln, as represented in Egyptian wall-paintings, is a tall circular chamber of brick, with a perforated floor near the bottom. The fuel was introduced from an opening on one side, and raked in under the brick floor. The pottery to be baked was piled up in the upper part of the chamber. Fig. 3, from a potter's votive tablet from Corinth, shows an early Greek form of kiln, with a place for the fuel on one side, and a door in the side of the upper chamber through which the pottery could be put in and withdrawn. The Corinthian kiln differs from the Egyptian kiln in being domed over, but it is the same in principle. Even at the present day kilns shaped almost exactly like this early Greek one are still largely used.

FIG. 3.—Early Greek pottery-kiln, about 700-600 B.C., from a painted votive tablet found at Corinth, now in the Louvre. The section shows the probable construction of the kiln.

SECTION I.—PREHISTORIC.

Pre-historic.

The art of making pottery is one of the most extreme antiquity; with the exception of the cave-dwellers of the Drift or Palæolithic period it was practised by all known prehistoric races from the Neolithic age downwards. The sepulchral barrows of Britain and other European countries have supplied vast stores of this earliest kind of pottery. It is mostly formed of coarse clay, generally brown in colour, though sometimes grey or reddish; some few specimens are fine in texture and have a slightly glossy surface. The clay, while moist, has been kneaded with some care, and is often mixed with a proportion of gravel, coarse sand, quartz crystals, or pounded pottery. The more carefully made specimens, chiefly those of the bronze and iron ages, are frequently covered with a smooth slip, made of the same clay as the body, but finely pounded and thoroughly mixed. All are alike "hand-made," without any assistance from the potter's wheel; some of the smaller ones are scooped out of a solid ball of clay, while in some cases great skill has been shown in the building up, by the unaided hand, of the thin walls of larger vessels, some of which are so round and neatly formed as to appear at first sight to be wheel-made. This, however, is never the case with the pottery of the three great prehistoric periods.

The shapes found in the sepulchral barrows of Britain, France, Scandinavia, and other countries are usually classified thus—(1) cinerary urns, (2) food vessels, (3) drinking-cups, and (4) the so-called "incense cups" (see fig. 4).

(1) Cinerary urns, usually found full of burned bones, are the largest, varying from 12 to 18 inches in height. They are mostly less ornamented and less carefully made than the smaller vessels. Most have their decoration confined to a band round the upper part of the pot, or often only a projecting flange lapped round the whole rim. A few have small handles, formed of pierced knobs of clay, and sometimes projecting rolls of clay looped, as it were, all round the urn. (2) Food-vessels vary considerably in size and form. Some are shaped like a tea-cup, with a handle on one side; others

are like small cinerary urns, either quite plain or with pierced knob-handles and bands of ornaments incised or impressed. (3) Drink-

FIG. 4.—Various forms of prehistoric pottery.

ing-cups, mostly from 6 to 8 inches high, vary but little in form, and are usually completely covered with ornament. They are often made with considerable care and skill, and are not ungraceful in shape. The names given to the preceding three classes possibly express their real use, but the name of the fourth class, "incense cups," is purely imaginary. Under this head are comprised a number of small vessels of very varied shape, some with their sides pierced through with square or lozenge-shaped openings, while others, almost globular in shape, have several pierced knob-handles, as if for suspension. Some are quite plain, and others are covered with ornament. Their use is unknown; one possible suggestion is that they were intended to carry fire from some sacred source to light the funeral pyre. Canon Greenwell, probably the best authority on this subject, believes, contrary to the opinion of many antiquaries, that none of the above classes of barrow-pottery were intended for domestic use, but that they were made solely to be buried with the dead. He considers that a fifth class of pottery, chiefly in the form of bowls, which has occasionally been found, not in barrows but in dwellings, is the only kind that was actually used for domestic purposes by prehistoric man (see Greenwell, *British Barrows*, 1877).

The ornament which is often lavishly applied on prehistoric pottery is of especial interest. It frequently consists of lines of small dots impressed from a notched piece of wood or metal, arranged in various patterns—crosses, chevrons, or zigzags. All the patterns were stamped into the body of the pot before it was hardened by fire. The lines were frequently made by pressing a twisted thong of skin against the moist clay, so that a sort of spiral, sunk line was produced. Other bands of ornament were made by wooden stamps; the end of a hollow round stick was used to form a row of small circles, or a round stick was used sideways to produce semicircular depressions. In some cases the incised lines or dots have been filled up with a white slip of pipeclay. Considerable taste and invention are shown by many of these combined ornaments, and a certain richness of decorative effect is produced on some of the best drinking-cups; but one thing is to be noted: all the main lines are straight, no wavy lines or circles appearing, except in very rare instances—a fact which points to the very limited artistic development attained by the prehistoric races.

Prehistoric pottery has sometimes been described as "sun-baked," but this is not the case; however imperfectly baked, the pieces have all been permanently hardened by fire, otherwise they would certainly not have lasted to our time. This was done in a very rough and imperfect manner, not in a kiln but in an open fire, so that in some cases the pots have received a superficial black colour from the smoke of the fuel. Great quantities of this pottery have been found in the sepulchral barrows of Great Britain and Ireland; those from the latter country are usually very superior in neatness of execution to the British specimens. The British Museum is specially rich in this class of pottery; chiefly the result of excavations made in British barrows by Canon Greenwell.

For prehistoric pottery, see Greenwell, *British Barrows*, 1877; Lubbock, *Prehistoric Times*, 1865; Boyd Dawkins, *Early Man in Britain*, 1880; D. Wilson, *Prehistoric Man*, 3d ed., 1876, and *Prehistoric Annals of Scotland*, 1851; Keller, *Lake-Dwellings in Switzerland* (tr. by Lee, 1878); Bonstetten, *Revue d'Antiquités Suisses*, 1855-57; Perrin, *Étude Préhistorique*, 1870; Troyon, *Habitations Lacustres*, 1860; Borlase, *Nenia Cornubia*, 1872.

SECTION II.—ANCIENT EGYPTIAN.

But few examples remain which date from the time of the earlier dynasties of Egypt, though from the XVIIIth Dynasty downwards a great quantity of specimens exist. Broken fragments, embedded in the clay bricks of which some of the oldest pyramids are built, supply us with a few imperfect samples whose date can be fixed. The early pottery of Egypt is of many varieties of quality: some is formed of coarse brown clay moulded by hand without the aid of the wheel; other specimens, thin and carefully wheel-made, are of fine red clay, with a slight surface gloss, something like the "Samian" pottery of the Romans. Some fragments of brown clay have been found, covered with a smooth slip made of a creamy white or yellowish clay. The early use of fine coloured enamels, afterwards brought to such perfection in Egypt, is shown by the enamelled clay plaques in black, white, and greenish blue which decorated the doorway of the great step-pyramid at Sakkára. Each plaque has a pierced projection at the back, so that it could be firmly fixed by means of a wood or metal dowel.

Materials.

Egypt is rich in materials for pottery, both glazed and enamelled. The finest of clays is washed down and deposited by the Nile; the sandy deserts supply pure silica; and a great part of the soil is saturated with the alkali necessary for the composition of vitreous enamels and glazes. In spite, however, of this abundance of materials the Egyptians never learned to apply either their enamels or their glazes, both of great beauty, to their larger works in pottery made of the fine Nile clay. The reason probably was that the clay was too fat, and therefore a vitreous coating would have flaked off during the firing, while they had not discovered the simple expedient of mixing with the native clay an addition of sand (silica), which would have enabled both glazes and enamels to form a firm coating over the body of the vessel. The colours used for Egyptian enamels and glazes are very varied, and of great beauty and brilliance. The glazes themselves are pure alkaline silicates, free from lead. The enamels are the same, with the addition of oxide of tin. The metallic oxides used to give the colours are these,—various shades of blue and green, protoxide of copper, or more rarely cobalt; purple and violet, oxide of manganese; yellow, iron or antimoniate of lead; red, sub-oxide of copper or iron; black, magnetic oxide of iron or manganese. The white enamel is simply silicate of soda with oxide of tin. The blues and greens, whether used in transparent glazes or opaque enamels, are often of extreme magnificence of colour, in an endless variety of tints,—turquoise, ultramarine, deep indigo, and all shades of blue passing into green. The most remarkable specimens of Egyptian enamel work are some clay plaques or slabs, about 10 inches high, which were used to decorate the walls of Rameses II.'s palace at Tel al-Yáhúdiya, in the Delta (14th cent. B.C.). These have figures of men and animals executed in many different colours in the most complicated and ingenious manner. They are partly modelled in slight relief, and then covered with coloured enamels; in other parts a sort of mosaic has been made by mixing fine clay and enamels into soft pastes, the design being fitted together and modelled in these coloured pastes while moist. The slab was then fired, and the enamel pastes were at once vitrified and fixed in their places by the heat. A third process applied to these elaborate slabs was to fit into cavities left for them certain small pieces of coloured glass or brilliant enamels, giving the effect of precious stones, which were fused into their places by a second firing. The chief figures on the plaques are processions of captives, about 8 inches high;

Enamelled clay plaques.

the enamel flesh is varied according to the nationality of the prisoners: negroes are black, others white, red, or yellow. Some of the dresses are represented with great richness: various embroidered or textile patterns of the most minute scale are shown by enamel inlay of many colours, and even jewel ornaments are shown by the inserted bits of glass; the dress of some Assyrian captives has patterns of great beauty and richness,—the sacred tree between the guardian beasts, and other figures. Besides these elaborate figure-reliefs an enormous number of smaller pieces of clay inlaid with different-coloured pastes were used to form a sort of mosaic wall-decoration in this wonderful palace, the ruins of which have supplied a perfect museum of all kinds and methods of enamelled work as applied to pottery. The British Museum and the Louvre have the finest specimens of these wall-slabs (see Birch, *Ancient Pottery*, p. 51, 1873).

The term "Egyptian porcelain" has sometimes been given to the small mummy-figures in brilliant blues and greens. This is a misnomer. The little figures, about 3 to 6 inches high, of which immense numbers have been found, mostly dating from about the XXth Dynasty downwards, are simply formed of sand (silica) with a little alkali, and only sufficient clay to cement them together, so that they could retain the form given them by the mould into which they were pressed. The result of analysis is silica 92, alumina 4, and a slight but varying proportion of soda. They are covered with a silicious glaze, brilliantly coloured with copper oxide, and are sometimes painted under the glaze with manganese, a deep purple-violet. A few of these figures, and also small statuettes of deities, have had oxide of tin mixed with the paste; the figure has then been exposed to sufficient heat to fuse the whole into one homogeneous vitreous mass, and thus the statuette has become a solid body of fine blue enamel. A few small objects—such as libation cups, bowls, and chalice-like goblets—were also made of the same sandy paste, covered with blue-green glaze. They are thick and clumsy owing to the very unplastic nature of their paste, which necessitated their being pressed in a mould, not wheel-made. The splendour of their colour, however, makes them objects of great beauty; they usually have a little painting, lightly executed in outline with manganese purple, generally a circle of fishes swimming or designs taken from the lotus-plant (see fig. 5).

FIG. 5.—Egyptian blue-glazed pottery.

During the XVIIIth and XIXth Dynasties and later Wall-pottery was used in many ways for wall-decoration. Bricks or tiles of coarse brown clay were covered with a fine white slip and glazed with brilliant colours. Another method was a sort of inlay, formed by stamping incised patterns into slabs of clay and filling up the sinkings with a semi-fluid clay of some other colour, exactly like the 16th-century Oiron ware. A number of brilliant wall-tiles covered with deep blue glaze, and painted in black outline with figures and hieroglyphs, have been found in many places in Lower Egypt; the painting is very simple and decorative in effect, drawn with much skill and precision of touch.

The Canopic vases are an important class and great quantities have been found in Egyptian tombs. They are generally made of plain brown-red clay, and have a lid in

FIG. 6.—Egyptian Canopic vase.

the shape of a human head. On them hieroglyphs are coarsely painted in black or colours (see fig. 6). They contained parts of the viscera of the corpse. The mummies themselves are frequently decked out with pectoral plates, necklaces, and other ornaments, made of clay covered with blue and other coloured enamels. Some of the pectoral plates are very elaborate works of the same class as the figure-reliefs from Tel al-Yahúdiya, richly decorated with inlay of different-coloured pastes and enamels.

Ptolemaic period.

During the Ptolemaic period a quantity of graceful and well-executed pottery was made in fine red and brown clay, mostly without any painted decoration. Some of the vases are of good form, owing to the influence of Greek taste (see fig. 7); others are coarsely decorated with rude painting in blue, green, red, yellow, and brown, either in simple bands or with lotus and other flower-patterns (see fig. 8). Both the body of the vases and the colours are usually quite devoid of any gloss. The duller colours are various earths, ochre, and white chalk, while the bright blues and greens are produced by mixing powdered enamel of the required colour with light-coloured clay, the depth of the tint depending on the proportion of the clay or chalk.

Certain very gaudy and ugly pots were made to imitate granite and steatite vessels (see fig. 8). They are of brown clay, rudely dabbed and speckled with brown, red, yellow, and grey colours to represent the markings of the stone; others are yellow, with grey streaks—imitations of marble; most have a painted white tablet, on which are hieroglyphs in black. The pigments are very shiny in texture, and appear to be unfired. Among the most delicate and carefully made kinds of Egyptian pottery are the round flat flasks shaped rather like the mediæval "pilgrim-bottle" (see fig. 9). They are sometimes made of blue paste, fine clay coloured with oxide of copper, and are delicately enriched with impressed ornaments, stamped from a mould, in low relief or slightly incised. The ornament is often designed like a gold necklace hung round the bottle; others have tablets with inscriptions. The surface is biscuit; and the flasks range in colour from light turquoise to deep ultramarine, the colour not being superficial but of equal strength all through the paste. Small vases of other forms, made of this same material, also occur, but they are rare.

Literature.—Wilkinson, *Ancient Egyptians* (ed. Birch, 1878); Birch, *Ancient Pottery*, 1878. A large number of works on ancient Egypt have some account of the pottery, but none are specially devoted to the subject. The most valuable contribution to the chronological arrangement of Egyptian pottery is contained in an article by Flinders Petrie, published in the *Archæological Journal* for 1888, vol. xl. p. 269. See also Pierret, *Dictionnaire d'Archéologie Égyptienne*, 1875; De Rougé, *Études Égyptologiques*, 1880; and Mariette, *Monuments du Musée . . . à Boulaq*, 1864.

SECTION III.—ASSYRIAN.

But little remains to us of the pottery of the primitive Accadian races of Babylonia and Assyria. It was all extremely simple and undecorated, partly hand-made and partly wheel-made, mostly graceful and natural in form, owing its beauty chiefly to the simple elegance of its shape and the fine material of which it was made,—the close-grained light yellow and brown clays in which the country between the Tigris and the Euphrates is so rich. The great city of Babylon—"figulis munitam urbem," as Juvenal (x. 171) calls it—was essentially a brick city, and depended for its magnificence to a great extent on such decoration as the potter could supply. Herodotus and Ctesias describe its lofty circuits of brick walls, the two inner walls lined with bricks enamelled in various colours, with figure-subjects, scenes of war and hunting (see BABYLON). The technical methods and enamel pigments used in Assyria and Babylonia were for the most part the same as those used in Egypt; but the Assyrian potters understood the use of oxide of lead as a flux to mix both with glazes and enamels,—an admixture which, though it to some extent injures the durability of the vitreous surface, enables it to be applied with greater ease, and to less silicious clays, without fear of its cracking off or blistering in the kiln.

The ruined palaces of Babylon and Nineveh have supplied great quantities of bricks painted in various colours, some as early as the 12th century B.C. The colours applied are of two distinct classes,—(1) thoroughly *vitrified enamels*, often coarse and bubbly in texture, and applied in considerable body, which are mostly brilliant though harmonious in tint, with a hard vitreous surface; (2) *earth colours*, chiefly ochres in various shades of quiet yellows and browns, owing their colours to different iron oxides and a pure white made of lime. The earth colours are very thinly applied, and have no surface gloss. Paintings executed in this manner were neither so hard nor so durable as those in the vitrified enamels, and were probably used mainly for panels of ceilings and the upper parts of walls, which were out of the reach of ordinary wear or injury. In a few paintings both methods are combined. The bricks themselves are of light brown or yellowish clay, with which a considerable quantity of straw was mixed. This was burned out in the firing, and so cavities were left, making the bricks light and porous. Many of the enamelled bricks are moulded in relief, with simple patterns of leaves, interlacing bands, waves, and the like, and were used to form cornices and running bands above and below the flat friezes or dados painted with human figures. The reliefs are picked out in colours with enamel, white, yellow, deep orange, soft red, brown, green, and blue, the enamel being sometimes nearly one-eighth of an inch thick. A common size for the bricks is 12 to 14 inches long by 6 to 7 wide, and about 4 inches thick. Sometimes two or three courses go to make a single moulded band. The British Museum and the Louvre possess the best specimens of these enamelled architectural features. The finest examples of pictured bricks were found in the great palace at Nimrúd; they appear, judging from the imperfect fragments that remain, to illustrate a victorious expedition by the Assyrians against a foreign nation. The paintings represent long lines of captives, and processions of the conquering Assyrians on foot, on horseback, and in chariots. They are executed on grounds of different colours—dull green, yellow, and blue—and show a strong feeling for harmony of colour and great skill in decorative arrangement; the figures are about 9 inches high. Some complete paintings were executed on one slab or panel. A fine one,

about 9 inches by 12, also found at Nimrúd, and now in the British Museum, has a picture of the Assyrian king under a fringed canopy giving audience to an officer. The king is followed by an attendant eunuch.

Wall-decorations.

In addition to figure-subjects and ornaments, large wall-surfaces were covered with cuneiform inscriptions, having letters about $1\frac{1}{2}$ inches high painted in white and yellow on blue or green grounds; these are executed on large slabs of coarse brown clay, to which a smooth surface, fit for painting, has been given by a thin coating or slip of fine-ground yellowish clay. Large slabs with pendants for ceilings, painted in the same way with very graceful patterns, have been found, all in simple earth colours. Another even more magnificent application of the potter's art to wall-decoration was by the use of coloured enamel pastes, like those described under the pottery of Egypt. These are reliefs modelled by hand, or pressed into clay moulds and then touched up by a modelling tool. The smaller ones, with delicately-executed figures in low relief, are all in paste of one colour—blue—with sufficient enamel added to the clay to give it a brilliant tint, but not sufficient for complete vitrification. Other fragments exist of life-size or even colossal figures, both in the round and in high relief, worked in pastes of many colours in a kind of mosaic fashion, extremely brilliant and striking in effect.

Literary use of pottery.

The most remarkable application of pottery in Assyria and Babylonia was its use for literary records. Tablets, cylinders, and polygonal prisms were impressed with cuneiform characters in the moist clay, and then baked, thus forming the most imperishable of all kinds of MSS. (cp. *BABYLONIA*, vol. iii. p. 191). The large inscribed cylinders and prisms were made hollow, and turned on the potter's wheel. The prisms were first moulded in a circular shape, the sides being afterwards made flat by slicing. All are circular inside, and bear distinct ring-like marks, showing the movement of the wheel as they were scooped out by the potter's thumb.

Vases and vessels.

The vases and domestic vessels of Assyria may be divided into four classes,—(1) plain biscuit clay, undecorated; (2) biscuit clay with painted decorations; (3) fine clay stamped with minute reliefs; (4) clay glazed or enamelled.

(1) By far the greater proportion of the pottery belongs to the first class. It is frequently graceful in shape, is well made and baked, and is of a fine close clay, generally light in colour. Fig. 10

FIG. 10.—Assyrian biscuit pottery.

shows some of the commonest forms. Some specimens have cuneiform inscriptions incised with a pointed tool in the same way as the cylinder letters. The coarser clays are usually covered with a fine whitish slip, and a rather rare variety of the pottery is made throughout of a close-grained almost white clay. One sort of pottery, of which very few specimens have been found, has simple patterns incised on the grey body of the vessel; these patterns were then made conspicuous by being filled in with white clay, a method of inlay like that used in Egypt. (2) Very few examples of the second class are known. Some vases of brown clay, covered with white slip, have rude paintings of human figures, bowmen and other soldiers, executed in brown outline, with rapid and skilful touch. Others have cuneiform inscriptions and geometrical floral patterns painted in silica and lime-white with yellow and brown ochres. They appear to belong to the 9th century B.C. Both the clay body and the earth pigments are quite free from any vitreous gloss in all this class of ware. A few fragments have been found of a coarse brown pottery, decorated with simple

patterns in gold leaf, applied after the ware was fired. (3) A very fine sort of Assyrian pottery, of which examples exist dating from the 10th to the 8th century B.C., is made of a close-grained ivory-white clay, or else a hard greyish black clay; the surface is biscuit, and is ornamented with bands of human figures in relief,—soldiers, captives, royal personages, and others, with representations of cities, all most minutely executed, the figures scarcely an inch high. Other bands have cuneiform inscriptions, also in delicate relief. The bands appear to have been formed by rolling a cylinder die or mould over the surface of the clay while soft and moist. The few specimens of this pottery that have been found are mostly in the form of cylindrical drinking-cups. This method of decoration is one largely used in the earliest variety of Etruscan pottery. (4) Glazed and enamelled pottery (see fig. 11) is more

FIG. 11.—Assyrian glazed and enamelled pottery.

abundant; it consists chiefly of small articles of fine clay, bottles, two-handled jugs, miniature amphoræ, and pilgrim-flasks, very carefully made, and apparently articles of luxury. Some are of white clay, covered with a colourless glaze of silicate of soda, rendered more fusible by the addition of oxide of lead. Partly owing to this addition the glaze is generally in a very decomposed state, often presenting the most brilliant iridescent colours. Other examples are coated in a similar way, except that the transparent glaze is tinted a brilliant blue or green with oxides of copper, very like the blue glaze so much used in Egypt, but usually less hard and bright in colour. A few small specimens have been discovered coated with a white tin enamel. Both the glazed and the enamelled pottery is undecorated by any painting.

At Warka (the Chaldean Erech) a large number of Clay very curious clay coffins were found in cave-tombs stacked closely one upon another. They are made of coarse clay, and bear outside patterns rudely stamped in blunt relief; the whole is covered with a plumbo-silicious green glaze. They are about 7 feet long and very peculiar in form; the body was introduced through an oval opening at the head, over which a similarly glazed clay lid fitted closely. These coffins are probably not earlier than the Sasanian period. Clay coffins of much greater antiquity have been found in Babylonia, but they are of plain biscuit clay.

Literature.—Layard, various works on Nineveh and Babylon; Rich, *Babylon and Persepolis*; Loftus, *Chaldaea and Susiana*, 1857; Oppert, *Expédition Scientifique en Mésopotamie*; Lepsius, *Denkmäler*, part ii. p. 163; Botta, *Monument de Ninive*, 1847-50; Place, *Ninive et l'Assyrie*, 1866-69.

SECTION IV.—PHENICIAN AND OTHER ARCHAIC CLASSES.

The discoveries of recent years have opened out a new Phœnician field in the history of the origin and growth of Hellenic art, especially as relating to pottery. Excavations in Cyprus, Rhodes, Thera (Santorin), the plains of Troy, Mycenæ, Attica, and the coasts of southern Italy have revealed the existence of an abundant class of pottery of great antiquity, a large part of which, in its forms and decoration, appears to have been due, directly or indirectly, to the Phœnicians. The designs are of a curiously complex character. Purely Assyrian motives, such as the sacred tree with its guardian "cherubs," are mingled with figures and ornaments peculiar to Egypt; other characteristics which modify and blend these two styles seem due to the Phœnicians themselves; while, lastly, various local influences are shown in the representations of such plants and animals as were commonest in the special place where the pottery happened to be made. Possibly some of the designs, such as the sacred tree of Assyria, might be traced farther back still, to the distant Asiatic home of the Indo-European races; but any derivation of this kind would, in our present state of knowledge, be purely conjectural.

The islands of Thera, Rhodes, and Cyprus, which were colonized by the Phœnicians at a very early period (see PHOENICIA, vol. xviii. p. 804 *sq.*), have supplied large quantities of archaic pottery, ornamented with characteristically Phœnician patterns and figures. The equally rich finds of pottery from Mycenæ and the Troad, though not free from Phœnician influence, have mostly a more native style of decoration. Though in some few cases the finding of Egyptian objects with dated hieroglyphs suggests a probable age for the pottery they were found with, yet in the main it is impossible to give even an approximate date to this large class of archaic pottery. Its production evidently extended over many centuries, and little or no help towards a chronological classification is given by any clearly-defined stages of artistic development. Some of the earlier specimens may possibly be as old as the 18th century B.C. (scarabs of Amenhotep III. were found with pottery in Rhodes), while later ones, not very different in style, were probably made as late as the 8th century.¹

Forms
and
mate-
rials.

Forms and Materials of Archaic Pottery.—There is a special charm about this early pottery. Graceful as the Greek vases of the best period of art are, there is something rigid and slightly mechanical in their highly-finished beauty, their polished surface, and their shape, accurately produced after some fixed model, from which but little deviation was permitted. Endless varieties of form occur in archaic pottery, changing with the mood and individuality of each potter; full of spirit and life, in their easy grace and the multiplicity of their flowing lines, these simple clay vessels give one—more perhaps than any other works of art—that keen æsthetic pleasure which consists in a retrospective sympathy with the joy that the artist took in his own handiwork. Extreme fertility of invention, as well as the utmost freedom of touch in the manipulation of the revolving mass of clay, are its chief characteristics. Fig. 12 gives some of the many forms.

FIG. 12.—Shapes of archaic pottery.

It is usually thin, light, and well baked, formed either of pale buff, whitish, or straw-coloured clay; or, if a darker clay is used, the surface is generally covered with a fine white slip composed of silica, lime, and a little alumina. This forms a ground for the painting, which is executed in ochre earths, browns, and reds of different shades, the colours of which are due to oxides of iron. Most of the pottery is biscuit, clay ground and painted ornament being

¹ See Schliemann, *Mycenæ* (1877), *Troy* (1875), and *Ilios* (1880); Cesnola, *Cyprus*, 1877; Dumont, *Les Céramiques de la Grèce*, 1881; Salzmänn, *Necropole de Camiros*, 1874-75.

alike free from any gloss; but in some cases silica and an alkali (probably carbonate of soda) have been added to the ochre pigment, which has thus become vitrified in the kiln and acquired a glossy surface. This does not occur among the earlier specimens.

Enamelled Pottery.—In some of the tombs in Ægina Enamel- and Rhodes a quantity of small vases, statuettes, and led vases, other objects have been found, executed under Egyptian &c. influence, with decoration of various coloured enamels. The colours used and the methods of manipulation resemble the enamel work of Egypt so closely as to need no special description. Some fine pilgrim-flasks of blue and green have blundered copies of hieroglyphs and representations of Egyptian deities incised in the moist clay. Less purely Egyptian in style are certain small vases (see fig. 13), coarsely ornamented with bands and chevrons in various enamels—white, blue, green, purple-brown, and yellow. The Louvre and the British Museum have the best specimens of these. Small vases, exactly similar in design and execution to those from Ægina and Rhodes, have been found in the tombs of Vulci and other places in Etruria, probably brought there by Phœnician traders, to whose intercourse with Egypt and knowledge of the Egyptian designs and mechanical processes the existence of the enamelled pottery of Rhodes is probably due. Other specimens have been found in the recently discovered Etruscan necropolis on the Esquiline in Rome.² One curious variety of early pottery is of a fine glossy red like the later Samian ware. Its smooth surface of rich red is due to the application of a thin finely-ground mixture of silica, soda, and some alumina, forming a vitreous enamel to which the opaque red colour was given by a large proportion of oxide of iron (see fig. 14). Some of this red pottery is of extreme anti-

FIG. 13.—Enamelled pottery from tombs in Rhodes, made under Egyptian influence.

FIG. 14.—Prehistoric red pottery from the Troad and Mycenæ.

quity; it is either smooth and undecorated, or has rudely-incised hatchings and zig-zags, scratched down to the clay body of the vessel through the red enamel. Another variety of very early pottery from Mycenæ and the Troad is of a hard black clay, with glossy surface (see fig. 15).

Painted Ornament on Archaic Vases.—This may be divided roughly into four classes. (1) Hatchings, concentric circles, chevrons, and other simple combinations of lines, arranged frequently in designs obviously suggested by matting or textile fabrics, and also various arrangements of spirals, apparently taken from patterns used in metal-work. Some of the designs of this class seem

FIG. 15.—Prehistoric black pottery from the Troad and Mycenæ.

² See *Ann. Inst.*, 1882, p. 2.

common to all races of men in an elementary stage of progress, and occur on the earliest known pottery, that of the Neolithic age (see fig. 16). (2) Representations of

FIG. 16.—Archaic vessels decorated with simple line ornament.

plants (often seaweeds) and marine animals, such as cuttle-fishes, medusæ, and star-fishes, or occasionally aquatic birds. This class of ornament appears to be more native in character—derived, that is, from various objects with

FIG. 17.—Archaic pottery decorated with natural objects—cuttle-fish, aquatic plant, and strips of seaweed.

which the potter was familiar—and not to have been a Phœnician import (see fig. 17). (3) Conventional ornament, a decorative arrangement in bands or scrolls of certain plants, such as the lotus or papyrus and the palm-tree. This class of ornament is distinctly Phœnician, and shows a predominance, sometimes of Assyrian, sometimes of Egyptian influence (see fig. 18).

(4) Very rude and badly-drawn figures of men and animals. They are mostly purely decorative and meaningless, are often merely drawn in outline, and have little or no help from incised lines, which became so important in the next stage of the development of pottery. Some of the figures are strongly Assyrian in character, while others of the rudest execution seem to be native.

It appears at first sight as if there was a distinct chronological order of development in these four classes of ornament—growing from simple line-patterns to the copying of easily represented natural objects, then to the invention of regular geometrical floral patterns, and lastly arriving at the rude depiction of human figures. Various points, however, combine to contradict such a theory of arrangement, such as the combinations in which these vessels have been found, the manner in which the various classes of ornament are mingled on the same vase, and lastly the fact that some elaborate and highly-finished vases, obviously of later date, are decorated solely with the straight-line and hatched patterns of the first of the four classes of ornament. Again, the ornament of the

FIG. 18.—Archaic pottery with flower ornament worked into conventional patterns.

second class, which appears to be native and local, can hardly be so altogether. Pottery found at places so far distant as Rhodes and Mycenæ has in some cases exactly similar painting of this sort, showing that a common artistic influence was at work in both places. The whole subject is a very difficult one, and little that is really definite can be asserted about it with safety—at least as yet.

Fig. 19 gives two vases of great interest. One shows the common decoration with wheel-applied circles, and also the Assyrian

FIG. 19.—Early vases (œnochoæ) with Assyrian sacred tree, or altar between guardian beasts.

altar-like object between two beasts; the other, from Cyprus, has the Assyrian sacred tree, with similar guardian animals. One of the most striking characteristics of archaic pottery of all classes, and especially of the earliest, is the great use made of the potter's wheel in applying the painted ornaments. Very many of the vessels are decorated with a number of encircling bands or lines, or on their sides with a number of concentric circles. These were easily applied, and very true circles were obtained by setting the pot (after it was dried in the sun) for a second time on the wheel, in the required position, either on its side or upright as it was originally turned. A brush held against the revolving vessel marked out the bands or circles. A very interesting votive tablet from Corinth (now in the Louvre), probably 700-600 B.C., shows a potter at work in his shop, applying painted bands in this way. He sets the wheel in motion with one hand, while with the other he holds the brush against the revolving pot. The wheel here shown (see fig. 20) is one of the earliest form, without the lower foot-

FIG. 20.—Votive tablet from Corinth, full size; a potter applying painted bands while the vessel revolves on the wheel.

turned disk.¹ The smaller circles were struck out with compasses, the central point of which has usually left a deep mark. The patterns used on the first class of pottery consist mostly of straight lines, hatched and crossed, arranged in squares, chevrons, triangles, and other simple figures, combined with concentric circles or, more rarely, wavy bands, the whole arranged frequently in very complicated and effective patterns. The second class has frequently varieties of seaweed and many marine creatures, all treated very simply, but drawn with great skill and appreciation of the characteristics of each object and its decorative capabilities. The third class—that of geometrical floral patterns—has but little variety. Some of the lotus patterns are almost identical with those used in Egypt and Assyria, and continued in use for vase decoration down to the most flourishing period of Greek art, though latterly in a stiff and rather lifeless form. The fourth class—that of figure-paintings—is of great interest; the earlier patterns are merely drawn in outline. Fig. 21 shows an œnochoe from Cyprus, now in the British Museum, of rather coarse red clay with yellow slip, on which is pencilled in outline a one-horse chariot driven at full speed by a slave; behind him stands a bowman shooting an arrow; the whole is strikingly Assyrian in style. Another œnochoe, found in Attica, of more primitive style, has a central band

¹ The writer of the article in *Ann. Inst.* (1882) on this painting has missed the chief point of interest, which is that the potter is using his wheel, not to mould the vase, but to apply the bands of colour round it.

covered with a number of warriors with round shields, all alike, most rudely executed; almost exactly similar figure-paintings occur on some of the Mycenæ pottery, and also on a large amphora from Cyprus (now in the British Museum), which has many bands, on which are painted in red ochre lines of men with crested heads (looking like North-American Indians) riding long weasel-shaped horses. Other bands on the same vase have centaurs, foot-soldiers, and various beasts, the latter, especially some stags, rather better drawn. They are painted in coarse dabs, and, except for a few of the eyes, have no incised lines. Smaller ornaments, such as the swastika and simple forms of rosettes, are often used to decorate the backgrounds and fill up spaces, but not to so great an extent as in the succeeding class of pottery.

FIG. 21.—Enochoe with painted bowman in a chariot, Assyrian style.

Among the earlier pottery from Mycenæ and the Troad are several very strange vases in coarse clay rudely modelled to indicate a human form. Some have the upper part formed like a head, very like the Egyptian Canopic vases. A great number of "pithi" (πίθι), enormous vases shaped something like amphoræ, have been discovered in Rhodes, the Troad, and other places, some as much as 7 feet high. Such vessels are often decorated with patterns in relief, chiefly combinations of spirals and the like, some closely resembling the designs on the sculptured architrave from the "Treasury of Atreus" at Mycenæ.

Vases with Bands or Friezes of Animals on Grounds sprinkled with Flowers.—This is a very large and important class, and very numerous specimens have been found widely scattered over the shores of the Mediterranean (see fig. 22). The production of vases of this style appears to have lasted for many centuries; the earlier ones are rudely executed in dull ochre colours on biscuit clay, like most archaic pottery, while the later ones have paintings in brilliant black enamel on a ground of red clay, thinly covered with a true vitreous glaze. This class of vase-painting, though mostly the work of Greek potters, is distinctly Oriental in character, probably Assyro-Phœnician. It is of extreme decorative richness: the surfaces of the vases are well covered, and the designs, though simply treated, are very effective, in many ways far more successful as works of decorative art than the elaborate and exquisitely drawn figure-pictures on later Greek vases. The ground is thickly covered with small decorative patterns; fig. 23 shows those used on more archaic vases. The animals that occur most frequently on the bands are lions, leopards, bulls, goats, deer, with various birds, such as cocks and swans, and also griffins, sphinxes, and sirens. A favourite motive of design is the sacred tree or a sort of column, each with a guardian beast at the sides. This is one of the most interesting of all designs in the history of ornament; it dates from an

FIG. 22.—Vase with bands of animals, Oriental in style. (British Museum.)

extremely early period, was used in ancient Chaldean art, and was handed on by the Sasanians to the Moslem conquerors of Persia; it survived, though altered and after its meaning was long forgotten, till even the 15th century in the textile fabrics worked in Italy after Oriental designs. The column between the beasts occurs on the Lion Gate of Mycenæ. In the later art of the Persians a fire-altar takes the place of the column.

FIG. 23.—Examples of small ornaments with which the ground of early vases is often studded.

Before passing on to consider the various classes of distinctly Hellenic pottery it will be convenient to give a list of the technical methods employed in all classes of pottery found in Hellenic sites, and also some account of the inscriptions and various forms of letters which are found on Greek vases.

Technical Methods and Inscriptions—Archaic and Greek Vases.

1. *Prehistoric Pottery from Mycenæ, the Troad, and other Hellenic Sites.*—**Materials:** yellow, red, or black clays; composition, siliceous, with free silica and lime, coloured by different sites. **oxides of iron;** slip, made of similar clays ground to a smooth paste. **Methods of treatment:** (a) plain biscuit clay; (b) clay covered with fine slip; (c) ornament of incised patterns, scratched through the slip upon the body of the pot, and sometimes filled in with whiter slip to make a conspicuous pattern; (d) pottery of hard fine clay, made glossy by a mechanical polish. Most if not all of this pottery was made without the wheel; but some was so skilfully modelled as to make it difficult to distinguish between hand-made and wheel-made vessels.

2. *Phœnician and other Archaic Pottery.*—This and all succeeding Phœnician classes are wheel-made. **Materials:** clays and slip as class 1; a cyan, &c. quite white slip was also used, made of a natural sort of pipeclay, or in some cases of a mixture of lime and silica with a little clay to bind it together. **Pigments:** earth-colours, made of brown and red ochres, occasionally mixed with an additional quantity of oxide of iron and free silica. **Methods:** the white or yellow slip was usually applied while the vase was revolving on the wheel, either with a brush or by the potter dipping his hands into a bowl of fluid slip just before finishing the final modelling or throwing of the vase; in some cases it has been applied by dipping the pot into the slip. The method of applying the painted bands is shown above in fig. 20. As a rule these vases were not fired at a sufficient heat to give them a vitreous gloss, though in some cases the heat has been enough to partly vitrify those of the ochre colours which contained a proportion of free silica and alkali.

3. *Vases with Black Figures and Incised Lines.*—**Materials:** (a) With clay, silica 56 per cent., alumina 19, red oxide of iron 16, lime 7½, black magnesia 1½ per cent.,—the average of many analyses; (b) slip, the figures same clay finely ground, and sometimes tinged a deeper red with an additional red oxide of iron,—the white slip is like that in class cited 2; (c) glaze, of almost imperceptible thickness, a silicate of soda; (d) black pigment,—a true vitreous enamel, which owes its deep black to the magnetic oxide of iron (composition—soda 17, silica 46, alumina 12, black peroxide of iron 17, lime 6 per cent.); (e) chocolate-red pigment, an ochre red sometimes mixed with finely-ground fragments of red pottery; (f) white pigment, like the white slip of class 2,—various analyses, silica 54 to 62, alumina 34 to 43, lime ¼ to ¾ per cent. **Methods:** the vase was first turned on the wheel, and, in order to give the pot a surface of deeper red, the slip was applied by a brush or by the hands of the potter while it was still revolving. The outline of the design was next roughly sketched, either with a point or in light-red ochre with a brush. After the vase had dried sufficiently in the sun so as to become firm, it was again put on the wheel, and the glaze, finely powdered and mixed with water, was applied to it with a brush as it revolved. The vase then appears, at least in some cases, to have been for the first time fired in the kiln in order to get a smooth almost non-absorbent surface for the use of the painter. In other cases the materials of the red slip and the silicate glaze were mixed, and the two applied together, as was done in the case of the Roman Samian ware. The painter next set to work and put on the black enamel

figures and ornaments with a brush. If a part of the vase round its whole circumference was to be black, such as the foot and neck, the vase was again set on the wheel and the black enamel put on as it revolved. This repeated use of the wheel for the application of slip, glaze, and black enamel was in order to secure an even coating with uniform grain, far more difficult to get with the unaided brush. The grain thus produced can usually be distinctly traced in each of the three coatings. The firing of the black enamel must have been done with great care and skill, as a very slight chemical change in the black oxide of iron converts it into the red oxide. Thus the same stroke of a brush is often (in the earlier vases of this class) half black and half vermilion-red, or one side of a vase is red and the other black, according as it has been played upon by oxidizing or deoxidizing products of combustion in the kiln. In the finest vases the black enamel is of great beauty, with wonderful rich softness of texture, which no modern skill has been able to approach. The tombs of Nola, Capua, and other places in Magna Græcia have supplied the most technically perfect vases, both for the fineness of their clay and the brilliance of their black enamel. After the firing of the enamel the details were drawn in by incised lines, cutting through the enamel down to the clay body of the vase. The clear and slightly-chipped edges of the lines show that they were done *after* firing, when the black enamel was in a hard vitreous state. This must have been done with some very sharp and hard point, probably a natural crystal of diamond or corundum, such as was used for engraving gems; the incised details on some vases are of almost microscopic minuteness.¹ The "non-vitreous" colours, red and white, were sometimes put on before, sometimes after the incised lines. They were fixed in their place by a slight firing, not enough to vitrify them or to soften the edges of the incised lines in the enamel. Both these changes have been shown to take place under a not very violent heat, by experiments made by the present writer on fragments of such vases. The white was used to depict the flesh of females and of some of the gods, such as Eros, or for the bodies of horses and the hair of old men. Chocolate-red was mostly used for ornamental touches on dress, armour, harness, and the like. Both are used in painting the heraldic beasts or ornaments which so often occur on the round shields of Greek warriors. Both the white and red are applied *over* the black. Thus the female figures are first completely painted in black, and the white afterwards applied over the face, hands, or other nude parts.²

With red figures. 4. *Vases with Red Figures.*—The materials employed and the first stages in the manufacture of this class are the same as those of class 3; but, instead of the figures being painted in black, the ground is covered with black enamel, and the figures left, showing the glazed red slip which covers the whole vase. This method produced a great artistic advance in the beauty of the figures, the details and inner lines of which could be executed with freedom and ease by brush-marked lines instead of by the laborious process of cutting incised lines through the very hard black enamel. The outline of the figures was drawn, with wonderful precision and rapidity, with a brush fully charged with fluid enamel, boldly applied so as to make a broad line or band about one-eighth of an inch wide all round each figure, one edge of the band giving the boundary of the required form. Details and inner markings were then added with a fine-pointed brush capable of making the thinnest and most delicate strokes. On many of the finest vases the contour-lines of muscles and other markings intended to be less salient were painted in pale brown instead of black. Last of all, the main part of the ground between the black outline bands was filled in. The greater thickness of the enamel, where it was more concentrated in the bands, is generally visible; the enamel used for filling in was thinner because it spread over a larger space as it flowed from the brush. In some cases a face or other part has had a thin black outline before the wider band was put on; and then *three* distinct thicknesses of enamel can be seen, the thin outline standing out perceptibly more than the rest. It is evident that the fluid black enamel was applied in a somewhat thick viscid state, and thus a slight degree of relief was often produced, enabling black lines to show over the black ground, as is the case sometimes with the strings of lyres. This slight relief often gives additional effect to the treatment of curly hair, represented by a series of dots or globules, as in the transitional amphora described below (p. 612). This method recalls the free use of the drill in the representation of hair on early engraved gems. Touches of white and red were occasionally used, as in the preceding class of vases, but to a much more limited extent. Some of the finest black and red vases, especially specimens from Nola, Vulci, and Capua, have enrichments in gold applied in relief.

5. *Polychromatic Vases.*—Materials: the same as in the preced-

¹ A very remarkable early vase, in the collection of Countess Zdzialinska in Paris, is decorated with incised lines only, the whole being covered with the black enamel.

² Unfortunately many Greek vases have been much injured while in the hands of dealers by the restoration of the white and red pigments. Vases which have been thus treated should be washed carefully with spirits of wine, which removes the modern touches without injury to the ancient pigments.

ing class with the addition of bright red, blue, green, and gold. Poly. The red used on some vases is an oxide of iron; but a very brilliant chromium crimson also occurs, which appears to have been added after matting the final firing, and is not therefore, properly speaking, a "ceramic" vases. pigment. The blue and green are different oxides of copper, fused with silica and soda to make a bright vitreous enamel, which was then finely powdered and mixed with a proportion of white pigment (silica and lime) according to the strength of the tint required. This powdered enamel pigment is the "smalto" of mediæval Italian painters. The gold was applied in leaf, not on the flat surface of the vase, but on a ground modelled in slight relief with semi-fluid slip of ordinary fine red clay, thus very much enhancing the effect produced by the gold leaf. Necklaces, bracelets, and other gold ornaments are always modelled in perceptible relief, producing a rich effect which no merely flat application of gold could give. Polychromatic vases may be divided into four main classes. (a) Vases in which the colours are used as *additional* decoration to the ordinary red figures, e.g., the celebrated amphora from Camirus (Rhodes), with the scene of Peleus winning Thetis as his bride (see Plate V.). (b) Vases painted in brown outline, on a fine white slip, with the addition of red and yellow ochre colours, and occasionally a little gold, e.g., the cylix in the British Museum with Aphrodite seated on a flying swan (see Plate V.); this is a rare and usually very beautiful variety, and is more fully described below (p. 613). (c) Attic funeral lecythi, which have the neck and foot in brilliant black (wheel-applied) enamel and the main body of the vase covered with a non-vitreous white slip. The design was sketched in rough outline and the red pigment put on with a small brush over the white ground. The drawing is generally careless and rapid, but often shows great skill and beauty of touch. The colours, generally red, blue, or green, were then thickly and often clumsily applied over parts of the red outline drawing, mostly over the draperies. These vases were not meant to be handled, as their colours rub off very easily: they were simply intended for sepulchral purposes, either to hang on the stele or *within* the tomb. (d) Vases, especially from Magna Græcia, such as rhytons, small cenochoæ, and others, moulded skilfully in a variety of fanciful shapes, heads of animals or deities, sphinxes, and other figures, either grotesque or beautiful. They are decorated partly with the usual red figures, and with the most brilliant black enamel, while other parts are painted in white and brilliant crimson with further enrichments in gold leaf. These bright colours seem to have been applied *after* the last firing, and not to be true ceramic colours.

6. *Black Vases of Metal-like Designs.*—These vases often have the Metal-fine sort of black enamel, especially the large amphora from Capua like and other places in Magna Græcia, covered all over with fluting or black gadroons. Some have wreaths of vine, olive, and other plants, or vases. imitations of gold necklaces modelled in slip, slightly in relief, and afterwards covered with gold leaf. A number of "phiale omphalæ" (saucer-shaped vessels), of about 200 B.C., were made by being pressed into a mould, and were thus stamped with figures in relief, such as processions of deities driving chariots. Some of these, made in Magna Græcia after its conquest by the Romans, have Latin inscriptions. One made at Cales is inscribed with the potter's name C. CANOLEIOS. L. F. FECIT. CALENOS (see *Ann. Inst.*, 1883, p. 66). Small asci were decorated with highly-finished figure-subjects, stamped on emblemata or tablets of clay, which were embedded in the vase while it was soft. Such elaborate and metal-like pieces of pottery are entirely covered with black enamel. They are often of great beauty, both in the composition of the relief figures and in their delicate execution. Vases of this class have been found entirely covered with gold or silver leaf, copies of metal plate.³

7. Vases, such as large asci, many from Magna Græcia, made of Vases simple yellowish biscuit clay, and modelled into shapes of female with heads, or covered with a number of statuettes of female figures. statuettes. They are generally painted simply in distemper in "non-ceramic" ettes. colours; but they fall rather under the head of TERRA-COTTA (q.v.). Some are of very great beauty, and are covered with statuettes very like those found at Tanagra.

8. *Greek Vases of Debased Style, last period.*—These have the Debased usual red figures on a black enamel ground, of the same materials, Greek and applied in the same way as on the earlier vases, except that vases. the black enamel is much thinner and very inferior in quality, frequently having a hard metallic gloss instead of the soft richness of the earlier vases. A great part of the figures and ornaments is executed in white, red, brown, and yellow pigments, with shading and gradations of colour, used to produce an effect of relief, which is unsuited to vase-painting, and, especially in the later examples, is executed with extreme rudeness and clumsiness of drawing. Vase-painting became degraded in style at a period when the other arts of Greece showed but little signs of decadence, and ceased altogether to be practised nearly a century before the Christian era. No painted vases were found in the buried cities of Pompeii, Herulanum, and Stabia; and Suetonius (*Julius Cæsar*, c. 81) mentions the eagerness with which certain Greek vases were found in tombs near

³ See Otto Jahn, *Vasen mit Goldschmuck*, Leipzig, 1866.

Capua were sought for. The floral ornaments on these later vases are very elaborate and realistic compared with those of the earlier period. Bands of graceful scroll-work with growing foliage are much used, often, in spite of their attempted relief, very beautiful and much superior to the figure-subjects which accompany them. Some strikingly resemble in style the painted friezes on Pompeian walls, and have lost all purely ceramic character.

Two abnormal and comparatively rare methods of vase-painting must be mentioned. One occurs on a number of Corinthian vases mostly now in the Louvre, pseudo-archaic in style, but apparently of the 5th century B.C. Such were first covered with white slip, which was in turn completely covered over with black enamel. The design was then made by the awkward process of cutting away the black in parts so as to leave black figures on a white ground—a kind of "sgraffiato." Another strange method was practised in southern Italy during the extreme decadence of vase-painting. The whole surface was covered with black enamel, and the figures were afterwards painted in red over the black so as to imitate the ordinary Greek vases with red figures and a black enamel painted round them. Most specimens are mere feeble imitations of the works of an earlier period; but a cylix in the British Museum is painted in this style with a graceful seated figure of Adonis or Meleager,—a very remarkable work, executed in warm browns and yellows, giving the effect of flesh, and shaded and touched with high lights in a thoroughly pictorial manner, which, though on a miniature scale, recalls the best wall-paintings of Pompeii or Rome.

Inscriptions.

Inscriptions on Vases.—Inscriptions are very numerous during the middle period of Greek art, while on the most archaic vases and those of the decadence they are mostly absent. They are of great interest in the history of Greek palæography, but are not always a safe guide as to the dates of vases, because archaic forms of letters were often used by vase-painters long after other forms of letters had come into general use. Vase-inscriptions may be divided roughly under two heads—Ionian and Dorian, the latter occurring mostly on the numerous vases from Corinth and her colonies. The accompanying table¹ shows the usual forms of letters which differ from the New-Attic alphabet; the latter is still in use, and has been but little changed since about 400 B.C., when the long vowels were introduced. Some of the early letters have no representative in the later Greek alphabet, e.g., the digamma F, the koppa Q, and the aspirate H or ʰ.

DORIAN.		IONIAN.	
		OLD ATTIC.	NEW ATTIC.
Α	—	Α	Α
ϸ	—	Λ	Γ
Β	—	Ε	Ε
“	—	Ι	Ζ
Η aspirate	—	Η aspirate	Η aspirate or ʰ
Θ ⊗	—	Θ ⊕	Θ
Ξ	—	Ι	Ι
Λ	—	Λ	Λ
Ξ	—	Χ Ζ	Ξ
Π	—	Π	Π
Q koppa	—	“	“
Ρ	—	Ρ	Ρ
Μ san	—	Σ	Σ
Φ	—	Φ	Φ
“	—	Φ Ζ	Ψ
Ω	—	Ω	Ω
Α digamma	—	“	“

One of the earliest vase-inscriptions known is that mentioned below (see fig. 24, p. 611) as occurring on a "pinax," or large flat platter, with archaic painting in brown, found at Camirus in

¹ Those letters which have the same form in all three lists are omitted.

Rhodes and now in the British Museum. Each figure has its name thus—

ΜΕΝΕΛΑΜ ϧΟΤΚΞ
ΕΥΦΟΡΒΟΜ

for ΜΕΝΕΛΑΣ, ΕΚΤΟΡ (retrograde), and ΕΥΦΟΡΒΟΣ. This curious inscription has the Ionian form of Ε, the Dorian Μ (san) for Σ, and a common archaic form of Θ for Φ, a very strange and exceptional combination of characters. The Burgon Panathenaic amphora (see fig. 25) has a very curious Old-Attic inscription, written downwards—

ΙΜΞ:ΥΟΙΘΑΥΘΞΥΞΘΑΥΟΤ

for ΤΟΝ ΑΘΕΝΕΘ[Ε]Ν ΑΘΛΟΝ Ε[Ι]ΜΙ, "I am one of the prizes from Athens," the usual inscription on prize vases. Vase-inscriptions are usually painted, if on a red ground in black or brown, if on a black ground in red or white. Some are incised, scratched after the vase was fired; but such occur less often. They are written both retrograde and from left to right, apparently without any fixed rule. Both methods frequently occur in the same inscription. A fine early Corinthian crater, found at Cære and now in the Louvre, with black figures representing Heracles feasting with Eurytus, has the names of the persons represented inscribed in the characteristic early Dorian manner—

ΒΥΡΥΤΞΟΜ ΜΟΤΞΦΞΑ

ΑΞΟΛΑ ΜΒΥΚΒΑΒΒ

for ΒΥΡΥΤΙΟΣ, ΕΥΡΙΤΟΣ, ΒΙΟΛΑ (Viola, a lady present at the feast), and ΗΕΡΑΚΛΕΣ. On the handle of the crater is scratched ϧΟ, for Corinth, the place where it was made.² Another Dorian inscription of great interest occurs on a votive clay tablet dedicated to Poseidon, about 4 by 2½ inches, now in the Louvre. Poseidon is represented at full length, holding a trident and a wreath, in black with incised lines; at each corner is a hole for fixing the tablet to the temple wall. It is inscribed—

ΥΑΔΞΑΤΟΤ

ΞΞΟΜΑΝΒΘΒΚΒ

for ΠΟΤΕΙΔΑΝ . . . ΟΝ ΜΑΝΕΘΗΚΕ, "— on dedicated me to Poseidon." This curious tablet was found at Corinth; the letters are very archaic in form, though the painting can hardly be earlier than the 6th century B.C.

The great majority of vases have inscriptions in Old-Attic characters, such as are shown in the two following examples. The subjects of the inscriptions may be divided into five heads, though of in-scrip- other miscellaneous ones also occur.

(1) On early vases rudely scratched trade-marks, or potters' marks, indicating the number of vases in a special batch and their prices. (2) Potters' and artists' names. The majority have only one name, possibly that of the master-potter, e.g.,

ΕΥΧΣΙΘΕΟΣ ΕΓΟΙΕΣΕΝ

for Εὐχθίδεος ἐποίησεν. In other cases, mostly on the finest vases, the name of the painter occurs as well as that of the potter, e.g.,

ΜΑΚΡΟΝ ΕΛΡΑΦΣΕΝ

for Μάκρων ἐγράφεν. Some artists, probably distinguished for their skill, painted the vases of several potters; other painters' names chiefly occur on the vase of one special potter. (3) Names of people, animals, and even things represented on the vases. A large proportion of the earlier vases have a name by the side of each figure, or at least by the side of the most important ones. Names of horses and dogs occasionally occur, and in a few instances even inanimate objects are designated by a name, e.g., the balance on the cylix of Arcesilaus in the Paris Bibliothèque and Zeus's throne on an early amphora in the Louvre. (4) Speeches uttered by the vase figures, e.g., in a scene representing a game at ball one of the players says ΧΡΗΣΑΝ ΜΟΙ ΤΑΝ ΣΦΑΙΡΑΝ, "Throw me the ball." Other vases have words of compliment or greeting, such as ΧΑΙΡΕ, "Hail!" or words relating to their contents, e.g., ΗΛΥΣ ΟΙΝΟΣ, "The wine is sweet." (5) Names of owners, often with the adjective ΚΑΛΟΣ or ΚΑΛΕ (if a lady), possibly intended for gifts, like the majolica plates inscribed with a lady's name fol-

² See *Mon. Inst.*, vol. vii.

lowed by the epithet "diva" or "bella." An amphora with a very curious inscription has recently been found at Orvieto, in early Attic characters—**ΖΕΛΙΘΗΜΙΑΚΟΝΕΘΟΥΔ** (retrograde)—meaning *δύ' ὀβολῶν καὶ με θύγες*, "Two obols, and you have me."¹

A quite different species of inscriptions occurs on vases of the latest class. Artists' and potters' names cease to appear with the rapidly-increasing decadence of the art. A black crater in the British Museum has a dedicatory inscription painted in white round the neck, **ΔΙΟΣ ΣΩΤΗΡΟΣ**, "Zeus the Saviour." A fine black fluted amphora has the owner's name, **ΑΡΙΣΤΑΡΧΟ ΑΡΙΣΤΩΝΟΣ**, in which the late C form of Z occurs. On a small black ascus in the British Museum is scratched rudely **ΠΡΟΠΗΝΕ ΜΗ ΚΑΤΘΗΣΙΣ**, "Drink, do not set me down." And some plain black measures have their capacity incised on them, e.g., **ΗΕΜΙΚΟΤΥΛΙΟΝ**, "Half a cotylion," on a cup-shaped vessel from Coreyra. One of the earliest known instances of Greek cursive writing occurs on a covered pyxis divided into four compartments (in the British Museum). It appears to have been used to contain the ashes of a Roman called Sergius. Under the foot is rudely scratched—

φιλε Σεργίειον χαιρε

"My beloved Sergius, farewell." The last word is blundered. And on the inside of the lid is a similar incised inscription—

Ταφος ἐστὶν δευτερος

"It is the second interment." The pyxis is apparently much older than the inscription, a supposition which is confirmed by the note as to its being a later burial.

One sort of inscription, used more largely by the Romans than the Greeks, was impressed from incuse stamps, a method chiefly used for large amphoræ and other vessels of plain biscuit clay, especially those made in Rhodes and Cnidus. These inscriptions, which date from the time of Alexander the Great down to the 1st century after Christ, usually give the name of an eponymous magistrate or chief priest, and have frequently in addition one of the thirteen months of the Doric calendar. Some of the stamps are circular, copied from current Rhodian coins, and have the legend round a front face of Helios, or the rose-blossom *ῥόδον*, which was the badge of the island. Other stamps are square or lozenge-shaped; they are usually impressed on the neck or handle of jars.²

Having considered the technical methods employed in the manufacture of Greek vases and the various classes of inscriptions which occur upon them, we will now return to the styles of vase-paintings and the subjects which are most frequently represented.

SECTION V.—HELLENIC.

Archaic. Archaic Class.—The manner in which the styles of ornament on early pottery merge almost insensibly one into another makes it difficult to arrange it in distinct classes, and it is not easy to say at what precise stage the term "Hellenic" can be given to the archaic vessels. The presence of Greek inscriptions makes, however, a convenient starting-point.

Probably the earliest known Greek ceramic inscription occurs on the Rhodian pinax mentioned above (see fig. 24). The painting on this, though rudely executed in brown and red ochres on a pale yellow slip-covered clay, the same in method as the earlier non-Hellenic paintings, shows a marked artistic advance by the fact that it represents a definite historical scene taken from the *Iliad*. No incised lines are used except for the feathers of the heraldic eagle on Hector's shield. A large number of other pinaxes were found at Camirus, of the same date, but without inscriptions and with purely decorative paintings, such as geometrical lotus-patterns, and spirited figures of bulls, sheep, and other animals, or sphinxes and gorgons' heads. Some large clay coffins, also found at Camirus, and others at Clazomenæ, belong to this class of pottery.³ One of those

from Camirus is in the British Museum. The top is decorated with painting in red and brown ochre colours.

FIG. 24.—Early inscribed pinax from Rhodes, with contest of Menelaus and Hector over the body of Euphorbus.

At the head is a bull between two lions, and below them two curious helmeted heads of warriors drawn in profile, both unfortunately much injured by restoration. Other parts are decorated with figures of beasts on a ground studded with rosettes and other small designs, in which some antiquaries see varieties of solar symbols; but, whatever their original meaning may have been, they appear on this pottery to be used merely as decoration. Other vases of a very early period with figure-subjects and inscriptions, probably of the 7th and 6th centuries B.C., have been found at Corinth, such as the "Dodwell pyxis," now at Munich, on the lid of which is painted the scene of the Calydonian boar hunted by various heroes in the presence of Agamemnon; each figure has an inscribed name. At Corinth also curious votive tablets have recently been found, some inscribed, with painted figures either of the god or of the donor; one of these is shown in fig. 20. It is very early in date.

The "Burgon amphora," so called from its finder, now in the British Museum (see fig. 25), is a very interesting specimen of this early class; it is one of the prize amphoræ which, filled with sacred olive oil, were given to the victors at the games held during the Panathenaic festival. It was found at Athens, filled with the ashes of its owner, and is no doubt the work of an Athenian potter. On one side is the usual figure of Athene Promachos in black, except the goddess's flesh, which is white, and the inscription and touches on the dress, which are in crimson. On the reverse side is the winner of the vase driving a biga, apparently in the act of winning the race which gained him the prize. On the neck of the vase is the owl sacred to Athene. The drawing of the figures is very rude, probably dating from the 6th century B.C.

The "François crater," found at Chiusi, now in the Etruscan Museum in Florence, is another important example of this early class. It is signed as the work of the potter Ergotimus and the painter Clitias, and is painted with a long series of subjects, all relating to the life and death of Achilles. It has no less than 115 explanatory inscriptions.⁴ Of about the same date, 6th century B.C.,

is the cylix of Arcesilaus found at Vulci, now in the Paris Bibliothèque. It is painted in black and red on a cream-

FIG. 25.—The Burgon Panathenaic amphora, with early Greek inscription.

white slip, and represents Arcesilaus, one of the Cyrenian kings of this name, superintending the weighing of a number of bags of the silphium plant. All the figures and even the scales have their names painted by their side. It is executed with great neatness and technical skill, but the drawing is stiff and awkward. The scene, which is represented with great dramatic vigour, appears to be on board a ship, judging from the complicated cordage overhead and the yard-arm from which the large balance is suspended.

It is at present impossible to fix with any certainty the dates of this early Hellenic pottery, as is also the case with the still older pottery of Rhodes and Mycenæ, but the increase of our knowledge on the subject tends to give a much more remote period to its production than has been hitherto assigned to it by the majority of writers on the subject. The foregoing class of pottery forms a link, with various stages of development, from the glossless vases painted in dull ochre browns and reds to that large and important class of Greek pottery which has figures painted in glossy black enamel, on a red, slightly glazed, clay ground, or less frequently on a cream-white ground. The vases of this class, found in large quantities over a wide area in Greece, Italy, and Sicily, include paintings of the most different kinds, from the rudest almost shapeless daubs to the most carefully-executed pictures, drawn with great beauty of composition and firm accuracy of form, though always retaining some amount of archaic stiffness and conventionalism. Though the faces are nearly always represented in profile, the eyes are shown front-wise, a method of treatment which continued in use even on the earlier vases of the next period, those with red figures on a black ground. Fig. 26 shows the progressive treatment

Red
vases
with
black
figures.

FIG. 26.—Series of human eyes from painted vases, showing the development of drawing, and power of representing the eye in profile.

of the human eye by vase-painters, from the earliest introduction of figures down to the end of the 4th century B.C.

Many of the floral ornaments of this period still retain clear signs of their Oriental origin. The sacred tree of Assyria, in an elaborate and highly conventionalized form, very frequently occurs, or, worked into a running pattern, it forms a continuous band of decoration, out of which the Greek so-called "honeysuckle pattern" seems to have been developed. These vases have far greater variety and richness in their decorative patterns than those with the black ground, the natural result of the great ease and freedom of hand with which delicate floral designs could be touched in with the brush in black, while in the later manner the red patterns had to be laboriously left out by working the black ground all round them. Hence the stiffness and poverty of invention which are so remarkable in the decorative patterns on the vases of the "best period." Many of the black figures of men and animals are executed with extraordinary minuteness, owing largely to the engraved gem-like treatment with which the incised lines are applied, especially in the representation of the hair of men or animals, and also in the rich textile patterns with which the draperies are often covered. Some of the vases, judging from their general form and thin band-like handles, were evidently copied from metal vessels, as, for example, a number of small amphoræ found in various places, executed in the workshop of Nicosthenes, a rather inartistic potter, who appears to have turned out a large number of vases with little or no variety in shape or ornament.

The later vases, with black figures, were produced simultaneously with the earlier ones decorated with red figures; and during this transitional period (about the middle of the 5th century B.C.) some vase-painters worked in both styles, both kinds of painting sometimes occurring even on the same vase. The British Museum possesses one of the finest specimens of these, a large amphora with nobly-designed paintings. On one side are two seated figures of Greek warriors, probably Ajax and Achilles, playing at a game like draughts. They are painted in black with chocolate-red touches, and minute details, such as the drapery over their armour and their way hair, executed in incised lines of extreme fineness and gem-like treatment. The other side of the vase has red figures on a black ground, a most powerfully drawn group of Heracles strangling the Nemæan lion in the presence of Iolaus, and an archaic statue-like figure of Athene. As in the painting with black figures, some touches of red are used. The treatment of Heracles's hair is peculiar and again recalls gem-engraver's work, in which hair is represented by a series of drilled holes; in this painting the stiff curls are given by a number of round dots of the black enamel, applied in considerable body so as to stand out in relief. This treatment frequently occurs on the fine vases of this and later periods, and the same method is occasionally used in a very effective way to represent bunches of grapes and the like.

Vases with Black Ground and Red Figures.—After about the middle of the 5th century B.C. this method superseded that with the black figures, and to this class belong the finest vases of all. The drawing of the earlier specimens is strongly sculptural in style, sometimes recalling the noble though slightly archaic pediment figures from Ægina, while the vase-paintings of a few years later seem to belong to the Phidian school; the forms are noble and massive, treated with great breadth and simplicity, and kept strictly to one plane; faces are nearly always drawn in profile, and all violent foreshortening of limbs is avoided. Some vase-painters of this period (c. 450-400) retain a slight touch of Oriental feeling in their drawing, as, for instance, the beautiful amphora by Euxitheus in the British Museum, which has single figures of Achilles and Briseis, one on each side (see fig. 27).

It should be remarked that the style of vase-paintings is generally rather archaic as compared with other branches

FIG. 27.—Amphora by Euxitheus (c. 450 B.C.), figure of Briseis; the other side has Achilles.

of contemporary art, as was the case with their inscriptions, and a certain conventionalism of treatment, such as would not be found in sculpture, lingers till quite the end of the 5th century B.C. Fig. 28 shows a painting from

FIG. 28.—Peleus leading home his bride Thetis; painting inside a cylix found in a tomb at Vulci (c. 440-420 B.C.).

the inside of a cylix, remarkable for the severe beauty and simple grace of its drawing and composition. The scene represents the moment when Peleus has won Thetis for his bride, and is leading her away in triumph, gently overcoming her modest reluctance; her shrinking and yet yielding attitude is drawn in the most refined and masterly manner possible.¹

In the succeeding century both drawing and composition

¹ The same design, though with inferior execution, is repeated on a cylix found at Corneto; see *Mon. Inst.*, xi., table xx.

began to gain in softness and grace, while losing something of their old vigour. Vase-paintings become more pictorial, and the compositions more elaborate and crowded; the British Museum has an amphora from Camirus (Rhodes), one of the most beautiful of this later class, elaborately decorated on one side with various coloured pigments and gold applied over the finished black and red figures. As in the earlier cylix of fig. 28 the scene represents the final triumph of Peleus in his pursuit of Thetis; in order to fill up the space some of the figures are placed, as it were, in the air, a method of composition peculiar to the later vase-paintings. Though not highly finished in details, such as the hands and feet, this picture is a perfect marvel of skilful touches rapidly applied, and of extreme beauty of form and general composition (see Plate V.). The funeral lecythi from tombs in the neighbourhood of Athens are a remarkable class of vases, c. 350-300 B.C. (see fig. 29). On these, over a white ground, are painted

FIG. 29.—Sepulchral lecythus from a tomb near Athens. (British Museum.)

representing Aphrodite seated on the back of a flying swan. For delicacy of touch and refined beauty of drawing this painting is quite unrivalled. The exquisite loveliness of Aphrodite's head and the pure grace of her profile, touched in with simple brush-formed lines, are quite indescribable, and show a combination of mechanical skill united to imaginative power and realization of the most perfect and ideal beauty such as no people but the Greeks can ever have so completely possessed (see Plate V.).

Vases of the Decadence.—The vases of this class are often of enormous size, covered with very numerous figures, often possessing much graceful beauty in form, but very inferior in execution and purity of drawing to the earlier paintings. The figures, especially in the later specimens, are thoroughly pictorial in treatment; many of them are painted in cream-white, with shaded modelling in yellows and browns. Effects of perspective are introduced in some of the architectural features, particularly in the bands of rich floral scroll-work. In the 2d century, till about 100 B.C., when painted vases ceased to be made, the paintings became extremely coarse and devoid of any merit whatever, though even at this time moulded vases, either decorated with reliefs all over or with small inserted emblemata, continued to be made of great artistic beauty. The extreme degradation to which vase-painting of this period fell seems to be due not so much to the general decay of the

arts among the Greeks as to the fact that the vases were no longer made by able artists, but were turned out in large quantities from the hands of an uneducated class of artisans. This was probably partly owing to increasing wealth and love of display, which created a demand for gold and silver plate rather than for the cheaper but more artistic beauty of painted clay.

Dates of vases. The dates of Greek vases are difficult to fix, partly from a natural tendency to archaism, which varies with the productions of different places, and partly because in some cases there was an artificial reproduction of old styles and methods. The following chronological classification, which is commonly accepted, is only very roughly correct, and is not applicable in all instances: (1) black figures on red ground, about 8th century to 440 B.C.; (2) red figures on black ground, of the best period, c. 440-300 B.C.; (3) period of decadence, c. 300-100 B.C. Fine moulded black vases, and vases with polychromatic paintings of good style, were made towards the end of the 4th and early part of the 3d century B.C.

Shapes and uses. *Shapes of Vases and their Use.*—From the 5th century and afterwards but little scope was left to the fancy of the individual potter in the forms of his vases. One special pattern was pretty closely adhered to for each sort, though, of course, modifications in shape took place as time went on. Fig. 30 gives the forms of the chief

FIG. 30.—Principal shapes of Greek vases and their names.

sorts of vases; a large number of others exist, each with its special name. Amphore and hydrie are the largest and most important, and have the grandest picture-subjects painted on them. The cylices frequently have paintings of wonderful delicacy and beauty; the later Athenian lecythi are remarkable for their polychromatic decoration. The uses of the painted vases is a very difficult question; few show any signs of wear, though they are made of soft clay easily scratched, and most of those which are represented in use on vase-pictures are plain black without any paintings. A beautiful little pyxis, or perfume-box, in the British Museum, shows in its pictured scene of a lady's toilet several painted vases, which are set about the room as ornaments, and have flowers or olive-branches in them (see fig. 31). Many vases

FIG. 31.—Painting from a small toilet-box or pyxis, showing painted vases used to decorate a lady's room. On the left is a gilt pyxis with a tall lid, and an enocheus on a low table; on the right two tall vases (lebes) on a plinth. All except the pyxis are decorated with painted figures, and contain flowers.

are blank, on one side, or have on the reverse side a painting of inferior execution, apparently because they remained set against a wall or in a niche. Nearly all those now existing came from

tombs, and it is probable that the ornamental vases were selected for sepulchral purposes, while a plainer and less decorated class was employed for actual domestic use.

Panathenaic Amphorae.—This is a very important class of vases,¹ Pan- extending over a long period, from the 6th to the end of the 4th Athenian century B.C. Fig. 25 above gives the earliest known specimen. amphora. They all have on one side a figure of Athene Promachos, and on the other a scene from the public athletic games. They are inscribed ΤΟΝ ΑΘΕΝΕΩΕΝ ΑΘΛΟΝ ΕΙΜΙ, and some of the later ones have the name of the eponymous archon as well, e.g., ΠΥΘΟΔΗΛΟΣ ΑΡΧΟΝ on an amphora from Care, now in the British Museum. Pythodelus was archon in 336 B.C., and so the date of the vases thus inscribed can be accurately determined. A number found at Benghazi and Teuchira in the Cyrenaica are now in the British Museum and the Louvre. Some of the archons' names on them are these—Nicocrates (333 B.C.), Nicetes (332 B.C.), Euthycritus (328 B.C.), Cephisodorus (323 B.C.), Archippus (321 B.C.), and Theophrastus (313 B.C.). The figure of Athene on all of them is rudely painted in pseudo-archaic style—the figure in black and white, with incised lines, on a red ground; the other side is painted in the same way, but is not archaic in drawing. Long vowels occur in the archons' names, but sometimes the same amphora has the obverse inscription written in the old way. They are all poor as works of art. One in the British Museum is of special interest from the design painted in white on Athene's shield. This is the celebrated sculptured group of Harmodius and Aristogiton by Critias and Nesiotes, of which an ancient copy exists in the Naples Museum, though the bronze original is lost.

Subjects of Vase-paintings.—These are of great interest, and are Subjects almost endless in number; only the scantiest outline can be given of vase- here, and, with so wide a range, any classification is necessarily paint- imperfect. The following list includes the majority of subjects. ings.

(1) Stories of the gods, scenes such as the Gigantomachia or the birth of Athene. (2) Scenes from the heroic age, as the achievements of Theseus and Heracles, the wars of Thebes, the battles with the Amazons, the voyage of the Argonauts, the Trojan War, the return of the Greeks from Troy, and the like. (3) Dionysiac subjects, such as orgies of Dionysus and dances of satyrs. (4) Scenes from real life, such as the vintage, olive-gathering, marriages, feasts, dancing, hunting, sacrifices, and theatrical subjects. (5) Funeral subjects, as mourners bewailing the dead or bringing offerings to a tomb. (6) Scenes from the gymnasium and various athletic exercises. (7) Allegorical subjects, with figures of happiness, wealth, youth, and the like. (8) Historical subjects, which, however, are rare: a very fine vase in the Louvre, of the best period, has Crusus on his funeral pyre; the cylix of Arcesilaus has been mentioned above; Anacreon playing on his lyre, and followed by his pet dog, occurs on several fine vases; the meeting of Sappho and Alcaeus is also represented; other portrait-figures appear, chiefly of poets and philosophers, many with inscribed names which are now unknown. (9) Humorous subjects: these are common on the vases of the latest period and are usually very coarsely painted; caricatures of mythological subjects frequently occur in which the gods are represented as dwarfs or hunchbacks.²

Places where Greek Vases have been found.—Till within the last Locali- twenty years most were discovered in the tombs of Magna Græcia, ties. Sicily, and Etruria. Capua, Nola, and Vulci supplied a very large quantity of vases of the finest sort with the most rich and brilliant enamel. Special characteristics of style and technique can be traced in the production of special localities, but these differences are not very important. Of late years Attica, the isthmus of Corinth, and other places on Hellenic soil have yielded a great many fine vases; the islands of the Aegean Sea and the western shores of Asia Minor are rich in sepulchral stores of these and all branches of Greek art. Athens possesses a fine and rapidly-increasing collection chiefly from Attica. The British Museum collection is on the whole the finest for Greek vases of all periods, though it is very poor in Etruscan pottery. The other chief collections of Europe are in the Louvre, at Naples, in the Vatican, at Florence, and Turin; Munich, Vienna, Berlin, and St Petersburg also have very fine collections; and there is a small one in the Bibliothèque, Paris.

SECTION VI.—PREHISTORIC AND ETRUSCAN IN ITALY.

Very many of the numerous vases discovered in the tombs of ETRURIA (*q.v.*) are imports either from Greece and its islands or from the neighbouring country of Magna Græcia. Nevertheless there is a large class of pottery which is distinctly native, extending over a very long period, from quite prehistoric ages down to the time when the Roman rule extended throughout the peninsula. This

¹ See *Ann. Inst.*, 1830, p. 209, and 1877, p. 294; also *Mon. Inst.*, x., tables xlvii., xlviii.

² See Heydemann, *Humoristische Vasenbilder*, Berlin, 1878.

pottery may be divided into six classes,—(1) prehistoric; (2) black glossy Etruscan; (3) pottery rudely painted with figures of purely Etruscan design; (4) plain biscuit clay, unpainted, but decorated with stamped reliefs; (5) later vases, badly-executed imitations of painted Greek vases, but having Etruscan subjects, or Greek subjects treated in a distinctly Etruscan manner; (6) large clay slabs, with painted figures, used for the wall-decoration of tombs.

Pre-historic. 1. *Prehistoric*.—This is the work of the Siculi, Oscans, Umbrians, and other occupiers of Italy before the arrival of the Etruscans. It is mostly small, made without the wheel, of coarse brown or blackish clay, slightly ornamented with ridges of clay modelled in relief. One curious variety is in the form of a primitive Oscan hut, with a movable door, fixed with pegs.¹ The Museo del Collegio Romano has a fine collection of the prehistoric

FIG. 32.—Prehistoric pottery from Italy.

pottery of Italy, Sardinia, and other places. Fig. 32 shows some of the commonest forms.

Etruscan black ware. 2. *Etruscan Black Ware*.²—It is remarkable that the Etruscan race, though so extraordinarily skilful in most of the handicrafts, did not excel at any period in their pottery. They were especially famed for their skill in metal-work, and hence perhaps this largest and most numerous class of their fictile ware is mostly shaped after metal forms and decorated with designs not specially suited to clay. The clay of which this black ware is composed consists (taking the average of many analyses) of the following ingredients,—silica 63, alumina 15, peroxide of iron 8, lime 3½, magnesia 2, and carbon 2. It is hard and metallic in appearance, generally of a glossy black, but sometimes grey. Its black is partly due to the superficial presence of free carbon, showing that the vases were fired in a close kiln, under the direct contact of the carbonaceous smoke from the fuel, a process called in modern times “the smother kiln.” If heated to a bright red in an open fire the ware loses its black colour and becomes greyish white or brown. Its forms and the figures stamped in blunt relief all suggest that they were copied from metal originals, a supposition strongly borne out by the fact that many of them are completely covered with gold or silver leaf (see fig. 33). The reliefs upon them consist of lions and other animals, sphinxes, chimærae, human figures, or geometrical patterns, all coarsely executed, and very blunt in their forms, partly from want

FIG. 33.—Etruscan oinochoe, of black ware, with figures in relief. (British Museum.)

¹ See Virchow, *Die italienischen und deutschen Haus-Urnen*, Berlin, 1884.

² See Lenormant, “Vases Étrusques de terre noire,” in *Gazette Archéologique*, 1879.

of sharpness in the moulds they are stamped from, and partly through the shrinkage of the clay in the kiln. Some of the shapes are graceful, especially those undecorated by reliefs (see fig. 34). Others are very fanciful, worked into

FIG. 34.—Plain Etruscan black pottery.

forms most unsuited for clay, such as “situlæ” or buckets, with movable ring handles; incense cups supported on thin bands of clay stamped with reliefs; and jugs shaped like hollow rings. A few have their shapes copied from Greek vases, e.g., a number of small amphoræ of exactly the same form as those made by the Greek potter Nicosthenes. A common form of Etruscan vase has a lid shaped like a human head, copied apparently from Egyptian Canopic vases. Some have human arms rudely modelled in clay and fastened on by pegs. Besides the black vases of this form, there exist many made of red clay covered with yellow slip.

3. *Etruscan Painted Vases*.—A number of very strange Etruscan large covered jars have been found at Cære (see fig. 35), painted more than 3 feet high, and rudely painted in dull colours (black, red, and white) with large figures of animals,—lions, wolves, horses, various birds, and some almost shapeless figures of men. There is considerable spirit in the drawing of the animals, as is often the case even when there was no power to delineate human beings. The finest of these vases are in the Louvre and at Orvieto. Some have only geometrical patterns,—bands of simple leaf-ornament, platbands, or chequers.

FIG. 35.—Early Etruscan painted jar. (Louvre.)

Others are shaped like large round boxes on a foot, with lids, nearly 2 feet high. One of those in the Louvre, of red clay blackened by smoke, has a very curious drawing in white pigment, coarsely executed. It represents a merchant-ship under full sail being attacked by a war-ship impelled only by oars; the latter is crowded with soldiers bearing round shields, each with an heraldic device. The other vessel has only one combatant, a bowman, who, mounted on the yard-arm, discharges an arrow at the enemy. This appears to be a pirate scene, and, though very rudely painted, it is not without strong dramatic force.³

4. *Vases in Biscuit Clay with Bands of Stamped Reliefs*. Biscuit vases with stamped reliefs. —These are mostly large pithi (see fig. 36) about 3 feet high, or thick pinaces (platters) 1 to 2 feet across. Some are of dull red clay, covered with bright red slip; others are yellow. The clay is coarse, mixed with crushed granite, sand, or pounded pottery, to which the coating of fine clay-slip gives a smooth surface. Their chief peculiarity consists in the bands of figures in relief with which they are decorated, and which were impressed on the soft clay by rolling along it wheels about 1 inch thick and 7 or 8 inches in circumference. Incuse figures were cut on the edges

³ A similar vase is illustrated in *Mon. Inst.*, ix., table iv.

of the wheels, which, when rolled over the clay, printed (like seals) rows of figures, and they were of course repeated every 7 or 8 inches, according to the size of the wheels. These stamped reliefs, mostly about an inch high, represent processions of animals,—lions, leopards, boars, ibexes, deer, horses, or griffins. Some have human figures, horsemen fighting with chimærae. One in the Louvre has a curious hunting-scene, a man, with two dogs, throwing short knobbed sticks to drive hares into a net. The bands are arranged, singly or double, round the rims of the pinaces and the shoulders of the pithi; the latter are also ornamented with rude fluting or "reeding" below the bands, or have occasionally reliefs, 2 to 3 inches square, stamped at intervals all round them instead of the continuous lines of figures.

FIG. 36.—Etruscan pithus or jar, with wheel-stamped band, and fluted body. (Louvre.)

Imitation
vases.

5. *Later Vases with Imitations of Greek Paintings.*—These are mostly copies of Greek forms, but very inferior, both in drawing and technical execution, to the real Greek vases, the black enamel especially being thin, and hard in texture. In appearance they resemble Greek vases of various periods, but are distinguishable by having paintings that are not Hellenic in subject or treatment, or by their Etruscan inscriptions. An amphora, now in the British Museum (see fig. 37), of early style, with black figures

FIG. 37.—Etruscan amphora, Greek style, with contest between Hercules and Juno, and bands of birds and animals; black, with incised lines.

and incised lines, has a painting of a scene which belongs specially to Latin mythology, viz., the contest at Pylus between Hercules and Juno Sospita; Minerva stands behind Hercules and Poseidon behind Juno. On each side of Juno is a caldron full of snakes, probably an allusion to the sacred serpent which was kept in the grove of Juno at Lanuvium. Another amphora in the Paris Bibliothèque has a painting of the scene where Admetus takes leave of Alcestis before her descent to Hades (see fig. 38). Two hideous demons are depicted,

waiting to seize their prey: one, Charun, with winged feet, brandishes a massive hammer; the other, Mantus,

FIG. 38.—Etruscan painting, an amphora of later Greek style; parting scene of Alcestis and Admetus, with Etruscan inscriptions.

with great white wings, holds a serpent in each hand; both have a fiendish aspect, with grinning teeth, like the devils in mediæval pictures of hell, and thoroughly un-Greek in spirit. This vase is in the style of the decadence of vase-painting, probably about 200 B.C.

6. *Painted Wall-slabs* were used to decorate the walls of tombs; they are from 4 to 5 feet high, about 2 feet wide, and about 1 inch thick. The upper part sometimes has a moulded cornice and a painted frieze with geometrical ornament. The lower part is covered with chequered squares or some other simple pattern. On the intermediate space are painted pictures with figures, about 2 feet high, representing sacrificial scenes, religious processions, and other subjects. The drawing shows Greek influence, but the costumes are Etruscan. The pigments are mostly simple earth-colours, red, brown, and yellow ochres, with black, white, and bluish grey; but bright greens and blues also occur, the latter made from oxides of copper, like the smalto on the Attic lecythi. The colours are all applied quite flatly; the female flesh is white, the male red; and the whole painting is emphasized by strong black outlines. The costumes are interesting; many of the garments fit tightly to the body, and the men mostly wear a peculiar sort of high boot turned up at the tip. It is doubtful whether they are executed in true ceramic colours fired in the kiln. They may possibly be only tempera paintings, like those on the tuff-walls of some of the excavated tombs. The great size of the well-baked clay slabs on which they are painted shows that the Etruscans must have constructed pottery-kilns of considerable dimensions.¹

Inscriptions on Etruscan Vases.—Painted words or phrases are not uncommon on the vases which are imitated from the Greek; they are usually illustrative of the subject, as, for example, the vase mentioned above with the parting scene of Alcestis and Admetus, which has, in addition to the names of the two principal figures, a sentence in the Etruscan language, spoken by Charun—"Eca ersce nac aqrum wlerorce" (I bear thee to Acheron). The names of Admetus and Alcestis are written retrograde,² thus—

ἄλκιστα ἰρσνα

Several Etruscan vases of black ware have been found with the complete Etruscan alphabet rudely scratched upon them. They give early forms of the twenty-two Phœnician letters, and are arranged in the Semitic order.³ A cup in the museum at Grosseto has two Greek letters added after the twenty-two which composed the Etruscan alphabet. Some late vases, not earlier than about 200 B.C., are interesting from having inscriptions painted in white, which give early forms of the Latin language. They are mostly dedicatory, with names of Latin deities, e.g., VOLCANI POCVLOM, "the cup of Vulcan"; BELOLAI POCVLOM, "the cup of Bellona," and others.

Dates of Etruscan Pottery.—These can only be roughly estimated. Dates.

¹ See Dennis, *Cities of Etruria*, ed. 1878.

² See Birch, *Ancient Pottery*, 1873, p. 460.

³ See Taylor, *Alphabet*, 1883, vol. ii. p. 73.

The black moulded ware (class 2) seems to range from about the 8th to the 3d century B.C. The large jars with stamped bands (class 4) appear to be all very early in date, about the 8th century B.C. They are not found in those tombs which contain painted vases. The large vessels with rude native paintings (class 3) are probably of the 6th and 7th centuries. The vases with imitations of Greek paintings extend over a long period, from about the 6th to the 2d century B.C.

Localities.

The greatest quantities of Etruscan pottery have been discovered in the tombs of Tarquinii, Caere, Veii, Cervetri, Chiusi, and near Orvieto, Volterra, Orvieto, and other places in central Italy, but above all at Vulci. The best collections are in the Louvre and the Vatican, at Florence, Naples, Turin, Bologna, Brescia, and many small towns in Italy in the neighbourhood of the various Etruscan cemeteries, such as Orvieto, Perugia, Grosseto, Volterra, Arezzo, and at Capua, where a very important ceramic museum is being formed.

Literature.—The best articles on the subject of Greek and Etruscan pottery are scattered through the numbers of various archaeological publications, especially the *Annali*, the *Monumenti*, and the *Bulletino dell'Istituto di Correspondenza Archeologica*, Rome, 1829, and still in progress. See also the *Bulletino Archeologico Napoletano*, 1842-59; Stephani, *Compte rendu de la Commission Archeologique*, St Petersburg, 1859 (in progress); *Bull. de Cor. Hellén.*, in progress; *Archäologische Zeitung*, Berlin; *Philologus: Zeitschrift für das klassische Alterthum*; *Rheinisches Museum für Philologie*; *Archæologia*, Soc. Ant. SECTION VII.—GRÆCO-ROMAN AND ROMAN.

Græco-Roman glazed ware.

Some specimens of very peculiar glazed pottery have been found at Cyrene, Cyme, Pergamum, Smyrna, Tarsus, and other Roman colonies in Asia Minor. It is very delicate and often graceful in shape (see fig. 39), with very thin handles, fashioned more like glass than pottery. It is remarkable for being covered with a thick vitreous glaze, usually coloured either green, orange, or purple-brown, with oxide of copper, antimoniate of lead, or manganese, quite unlike the thin almost imperceptible glaze of Greek vases. This pottery is mostly small; some pieces are in the shapes of oenochæ, two-handed cups, or asci, the latter covered with graceful patterns of vines or other plants moulded in slight relief. Statuettes and delicate reliefs, parti-coloured with different glazes or enamels, have been found at several of the above places, and also larger vessels, craters, and bottle-shaped vases, decorated with moulded clay emblemata, wholly covered with a fine blue glaze. The Louvre and the British Museum have the best specimens of this rare ware, which probably dates from the 1st century B.C. downwards.

"Samian" ware, the characteristics of which are described below, was made in Italy during the first period of Græco-Roman art. In 1883 some moulds for cups and bowls were found at Arezzo, all of the most wonderful beauty and gem-like delicacy of execution. The figures

FIG. 39.—Græco-Roman oenochæ, highly glazed ware, from Asia Minor. (British Museum.)

on them are from about 3 to 4 inches high, but are large and sculptural in their breadth of treatment. Some of the exquisite reliefs represent dancing fauns and bacchanals, with flowing drapery, on a background enriched with vine plants in slight relief. Another has a love scene of extraordinary grace and refined beauty. The modelling of the nude throughout is most masterly. The treatment of these reliefs recalls the school of Praxiteles, though they are probably not earlier than the 1st or 2d century B.C.

Roman Pottery, 1st Century B.C. to 5th Century A.D.—Throughout Italy, Spain, France, Germany, Britain, and other countries occupied by the Romans great quantities of pottery have been found, varying but little in design or manner of execution. The principal varieties of this large and widely-spread species of ware may be classified thus—(1) Samian ware; (2) plain biscuit clay; (3) pottery decorated with slip in relief; (4) black ware; (5) glazed ware.

1. The first class is a fine glossy red ware called Samian "Samian" from its resemblance to the red pottery produced in the Greek island of Samos. The name is a convenient one, and as it is used by Pliny (*H. N.*, xxxv. 46) and other early writers it is well not to discard it, though probably the real Greek Samian pottery bore little resemblance to that made by the Romans except in colour and glossy surface. It is of a fine red sealing-wax-like colour, of pleasant texture, and is generally decorated with moulded reliefs. *Materials*: the clay body usually consists of silica 50-64 parts, alumina 18-25, red oxide of iron 7-10, and lime 2-9 parts; these proportions vary in different specimens. The red vitreous glaze, or rather enamel, which gives the ware its fine glossy surface consists of silica 64 parts, soda 20, and red oxide of iron 11 (average analysis).

Method of manufacture: the bowls, cups, and other vessels, richly decorated outside with reliefs, were made thus. In the case of a bowl, a mould was first prepared, of hard well-burned clay, covered *inside* with incuse designs; these sunk patterns were made either by hand-modelling or, more usually, with the aid of stamps modelled in relief. Thus the *inside* of the bowl-mould corresponded to the *outside* of the future Samian bowl, which was first turned on the wheel quite plain, but of the right size to fit into the mould. Then, while it was still soft it was pressed into the mould, and afterwards both were put upon the wheel together. As the wheel revolved, the potter could at the same time press the clay into the sunk ornaments of the mould and finish neatly the inside of the vessel. In some cases he raised the walls of the bowl high above the mould by adding clay, and thus with the same mould could produce a variety of forms, though the lower or decorated portion always remained the same. A fine crater in the Louvre was made in this way. The vessel was then removed from the mould and the reliefs touched up by hand (in the finer specimens) with bone or wooden modelling-tools. The reliefs thus produced are often very graceful in design, but are mostly wanting in sharpness, many being blunted by the touch of the potter's fingers in handling the pot after it was removed from the mould.¹ It was next covered with the materials for the red enamel, very finely ground and fired in the usual way. Fig. 40 shows a design of typical character. The outer reliefs consist generally of graceful flowing scroll-work of vines, ivy, or other ornaments, mixed occasionally with human figures and animals. The finest sorts of Samian ware were made at Arezzo (Aretium) in Italy² and Saguntum in Spain (the modern

¹ In some rare cases the reliefs were moulded separately and then applied to the plain wheel-turned vessel while yet soft, but this was exceptional.

² See Fabroni, *Vasi fittili Aretini*, 1841, and Inghirami, *Mon. Etrus.*, 1845.

Murviedro). It was also produced in France and Germany, and the discovery of a Samian bowl-mould at York makes it appear probable that it was made in Britain, where great quantities of it have been found. This ware is of great beauty, both in colour and in its delicate surface reliefs; it is the most artistic sort

FIG. 40.—Bowl of Samian ware, with moulded patterns in slight relief.

of pottery that the Romans produced. It appears to have been highly valued, as many Samian bowls have been found carefully mended with bronze or lead rivets. In addition to the moulded ware many vessels of the same class were made plain from the wheel; others have a peculiar scale ornament in relief applied by the potter's thumb, a form of decoration common in other varieties of Roman pottery.

Plain
biscuit.

2. *Plain Biscuit Pottery* is made of simple unglazed clay, without decoration, of a soft body and quite porous. The clay is mostly composed thus: silica 48-69 per cent., alumina 10-22, oxide of iron 8-13, lime 1 1/2-18 per cent., but it, of course, varies according to the locality where the pottery was made. Fig. 41 shows some of the forms of

FIG. 41.—Typical shapes of common Roman biscuit pottery.

this simple ware. It was specially used for amphoræ, often nearly 2 feet high, sepulchral urns, and vessels for common domestic use. The forms are mostly graceful and natural. The clay is of many colours, including all shades of red, grey, brown, yellow, and (rarely) almost pure white. Some of this pottery has the grain which had been produced by the wheel carefully smoothed out by a tool or the potter's hand, or in some cases by dipping the piece into a bath of thin fluid slip, but it is more commonly left without any attempt at smoothness or high finish.

Pottery
with
reliefs
in slip.

3. *Pottery with Reliefs applied in Slip.*—This is a very remarkable kind of decoration, in which great skill was shown by the Roman potters. The slip, finely-ground clay, was mixed with water to about the consistency of very thick cream, and was allowed to run slowly or drop

off a wooden point or flat spatula upon the outside of ordinary wheel-made pottery. Very spirited figures of animals (see fig. 42)—hares pursued by dogs, lions, goats, horses, deer, or even complicated subjects with human figures such as gladiators' combats—and a great variety of graceful scroll-ornaments of vine, ivy, or convolvulus were produced in this way with wonderful ingenuity. Both the outline and the modelling were given with curious precision by the quantity of semi-fluid slip

FIG. 42.—Roman cup, with reliefs of a stag pursued by a hound, executed in semi-fluid slip.

of a dog would be poured off a sort of small palette-knife, and its thinner legs formed by trailing along a point dipped in the slip. Tools for this purpose have been found near Roman kilns. One of the most elaborate specimens of this kind of pottery is a cup in the Colchester Museum, covered with reliefs of chariot-races and gladiators' combats, done with great vigour and even minuteness of detail considering the difficulties of the process. In some cases, especially when the designs are simple scroll or geometrical ornaments, additional effect is produced by the use of a slip coloured differently from the body of the pot. Frequently the relief-patterns are white, made of pipeclay, applied to a red or dark coloured vessel. The vessels with this class of decoration are mostly small bowls, cups, or bottle-like vases. Some few are made of the Samian ware, but more commonly they are grey or blackish with body and slip both of the same clay. A great deal of coarse Roman pottery is rudely decorated with a thin slip of red, white, or yellow clay, put on with a brush in coarse bands or scroll-patterns. The slip in this case is treated as a pigment of the simplest kind, and does not stand out in relief. With this trifling exception, nothing in the form of painted vases was produced by the potters of Roman times.

4. *Black Pottery* is usually made from a very silicious or Black sandy clay, composed thus—(average of several analyses) ware, silica 76 parts, alumina 10, oxide of iron 9, lime 2. It owes its black colour and rather metallic gloss to the direct contact of smoke in a close or smother kiln. If heated in an open fire it burns out usually to a greyish white. A great deal of this ware belongs also to class 3, as it is frequently decorated with simple patterns in white slip; the presence of the white clay on the black body implies a second firing, free from the contact of smoke, and not high enough in temperature to burn the black out of the body of the pot. This ware was largely made at many places in Germany along the Rhine, in France, and especially at Castor in Northamptonshire, where remains of many Roman kilns have been found. It varies very much in shape and in method of decoration. Some of the numerous specimens from Bonn and Rheinzabern are treated in a manner different from the British varieties. A few are coated with a black similar to that used by the Greeks, but very thin and poor in quality. Others have a mechanical polish applied after firing, whilst the pot was again set on the wheel, by rubbing it with black lead, occasionally applied in bands of alternately dull and bright black all round the pot. A fine specimen from Coblenz, now in the Sèvres Museum, has a curious combination of stamped work and reliefs formed in fluid slip. The design represents a lion running through vine-branches. The body of the lion and the grapes are stamped from a mould, the rest being done in slip. Cups and small jars of this ware are frequently modelled into strange shapes by

being pinched in at various places by the potter's fingers while they were fresh from the wheel. Others are decorated with groups of dots, made of semi-fluid slip, apparently applied through a pierced stencil-plate (see fig. 43). The dots are arranged in close rows, forming rectangular patches, arranged round the body of the vessel,—a very dull kind of ornament, which may, however, have had a practical use in making the pottery less liable to slip from the holder's fingers.

FIG. 43.—Roman black ware decorated with groups of dots in relief, and blackened in the smother kiln.

Glazed ware.

5. *Glazed Pottery*.—This is rare, but has been found in most of the countries once occupied by the Romans. Some of the best specimens resemble that described above as Græco-Roman glazed ware. Most are, however, very inferior, both in execution and in the quality of the glaze, which is a true glass, usually coloured light green or brownish yellow. A cake of semi-fused greenish glass, apparently intended for this purpose, was found in the ruins of a kiln in Britain. This glazed pottery is small, and is decorated in various ways, by incised lines, or groups of dots in relief, or by brush-applied stripes of red or white clay.

Mortaria.

In addition to the forms of Roman domestic pottery shown in the above figures one peculiar shape occurs very frequently, namely, the "mortarium," a large shallow dish, made of thick clay, with a spout at one side, used for tritulating cooked vegetables or other soft substances. The inside of these mortar-like dishes is often roughened by being sprinkled, while in a soft state, with crushed quartz or pottery, apparently to aid the process of pounding. They are made of various kinds of ware, especially red Samian and yellow biscuit clay.

Clay lamps.

Clay lamps were very largely used by the Romans, mostly made of plain biscuit clay, but the finest specimens are in the red Samian ware. A few have been found with a thick vitreous glaze, coloured like the rest of the Roman glazed wares (see LAMP, vol. xiv. p. 247).

Baked bricks.

An extensive use of baked clay was made by the Romans in the manufacture of bricks, roofing-tiles, flue-tiles, drain-pipes, baths, and even coffins. The bricks are generally very large and thin, some 15 to 18 inches long, and only 1 1/2 inches thick, and walls were entirely built of them. They were also used to form alternating bands in stone walls, the brick bands usually consisting of from three to five courses. In Rome bricks were merely used as a facing to concrete walls. They are always triangular in shape, except such as were set at the angles of walls and used as facing to arches. Those used for the latter purpose are generally two Roman feet square (about 1 foot 11 1/2 inches English). See ROMAN. The system of heating employed by the Romans in their houses and baths was very ingenious and complete. Sometimes the whole walls of a room were lined with clay flue-pipes, square in section, which, being connected at the bottom with the hypocaust, carried the hot air over the whole wall-surface as well as under the floor (see BATH), the mosaic and concrete area of which (the "suspensura") was supported on large clay slabs carried on short brick pillars. Flanged tiles, similar to those used for roofing, were often built up on edge, with others set across the top, to form graves, and to protect the sepulchral urns and other buried objects from being crushed by the weight of earth upon them.

Roman kilns.

Roman Pottery-kilns.—Great numbers of Roman kilns have been found in various countries, but none quite perfect. They are small, round, or oval structures of brick, with a place for the fuel at one side, and a floor made of pierced slabs of clay, on which the pots were piled, the flames and hot air passing through the holes in the clay floor. Most kilns were probably covered by a brick dome with a central opening, exactly the same in principle as the early Corinthian kiln shown in fig. 3. The smother kilns may, however, have been arranged rather differently, so as to fire the pots in an atmosphere of heated smoke; or this may have been done by partly closing the aperture at the top, in order to half smother the fire, and prevent its burning with a hot clear flame. Fig. 44 shows the remains of one of the Castor kilns, about 7 feet in diameter, with an arched opening for the insertion of the fuel, and a pierced floor, made of large clay slabs radiating to a central point, where they were supported by a brick pillar. Other kilns have been found in the Upchurch marshes (Kent), along the Severn banks in Shropshire, at Ashdon (Essex), Colchester, London, York, and many other Romano-British towns. Though varying in shape, yet in general

principle Roman kilns, in whatever country they are found, are practically the same.

Inscriptions on Roman Pottery.—Potters' names, impressed from oblong or circular incuse stamps, occur very frequently on many varieties of Roman pottery, especially on the plain biscuit and

FIG. 44.—Roman kiln found at Castor. The low arch is for the insertion of the fuel; the pots rested on the perforated floor, made of clay slabs; the top of the kiln is missing,—it was probably a dome.

Samian wares. Teutonic and Gaulish names sometimes appear, showing that in certain cases native potters worked at the Roman potteries. When the potter's name is in the nominative, it is followed by F. or FECIT; if in the genitive, by MANV or OFFICINA, usually in some contracted form. In addition to the potter's name those of the owner of the workshop and of the estate from which the clay came occasionally occur, as, for example, Q(US) DOL(I)ARE L. IVLI THEOD(OTI) E(QVITIS) R(OMANI) FIG(LINAE) SAL(ARIAE) EX PR(AEDIS) FL(AVII) TITIANI C. V. (clarissimi viri), "Pot-work from the salarian manufactory belonging to L. Julius Theodotus, a Roman knight, (the clay taken) from the estate of Flavius Titianus, a most distinguished person," this last being a title used like the English "esquire." This brick stamp is from a house built against the ancient wall round the Capitoline hill, and dates from the middle of the 2d century A.D. Few brick stamps found in Rome are older than the end of the 1st century A.D.; but some have been found at Velia in Cisalpine Gaul dated with the names of the consuls for 75 B.C. Others have also the name of the ruling emperor. Roman soldiers were often employed to make bricks and tiles; and many such are stamped with the mark or number of a Roman legion, e.g., LEG. VI. for "legio sexta." Amphoræ were occasionally inscribed, in rudely-painted ochre colours, with words to indicate the quality of wine they contained or their measure of capacity, but such inscriptions were probably added when the amphoræ were in their owner's cellar, and were simply painted in tempera. Numbers of large amphoræ were frequently embedded in the concrete of which Roman vaults were made, especially during the 3d and 4th centuries A.D., one object of this being to gain lightness without much loss of strength. The circus of Maxentius and the mausoleum of the empress Helena, both outside the walls of Rome, are examples of this curious use of pottery.

SECTION VIII.—PERSIAN AND MOSLEM.

It is convenient to class under this head all the numerous varieties of pottery which were the work of Moslem races. In all this pottery, with the exception of that included under the head "Hispano-Moorish" (see p. 622), there is a great similarity in character of design and in methods of execution, both of which appear to a great extent to have been originated and brought to highest perfection under the Persians, who seem to have inherited, through the Sasanians, much of the skill in manipulating clay and manufacturing enamels and glazes which was possessed by the people of ancient Assyria. The Persians of the 10th to the 17th century, perfect masters of all the decorative arts to a degree possessed probably by no other

race or age, excelled in pottery as in other handicrafts. Their enamels and glazes are made and applied with the greatest skill; their colours are brilliant and yet harmonious; and the patterns painted on their pottery are designed with the most wonderful grace and freedom, together with a perfect sense of the right kind of ornament to use for each special place and material.

Materials.

Materials used by Persian Potters.—In most cases the clay body of Persian pottery is completely covered either with a white enamel or with slip, and therefore any sort of clay sufficiently plastic for the wheel suited the purpose, whatever its colour. The enamel was much the same as that used by the ancient Assyrians, except that it contained a much larger proportion of oxide of lead, of which there were often three parts to one of oxide of tin and five of silicate of soda. The white slip is silicate of alumina with some alkali. The glaze is either a pure silicate of soda, or has in addition a little oxide of lead to increase its fusibility. The pigments are oxides of cobalt and copper for the blues and greens, manganese for the purples, oxides of copper and iron for the reds, magnetic oxide of iron for the black, and antimony for the yellow; a rich warm orange was produced by a mixture of antimony and red oxide of iron. It is not always possible without actual analysis to tell whether the white ground of Persian pottery is a tin enamel or a glazed slip, especially as in many cases a glaze is applied over the enamel; but this is not a point of great importance, as the decorative treatment of the white ground was in either case much the same.

Lustred ware.

The following are the chief varieties of Persian pottery.

1. *Lustred Ware.*—The application of lustre colours requires a special process of firing. The following description applies equally to the other two classes of pottery in which lustre pigments were largely used, namely, Hispano-Moorish and Italian majolica. The special beauty of the lustre depends on the decomposition of a metallic salt, usually silver or copper; the required design was painted in a pigment composed mainly of this salt over the surface of the smooth enamel or glaze after it had been fired. The vessel with the lustre pigments was then fired again in a kiln specially so arranged that the heated gases and smoke should come into contact with the metallic pigments; the minute and heated particles of carbon in the smoke combined with the oxygen of the salt, setting free the metal, which was left, in a finely-divided state, fixed on the surface of the enamel. In this way a beautiful prismatic effect was produced like the colours of mother-of-pearl. The lustre colours when looked at from one point of view are simply various shades of browns and yellows, but when seen at an angle they appear shot with the most brilliant violets, blues, purples, and red. They were used generally, and with best effect, over a white ground (see fig. 45), but also over deep-blue or green enamels. Lustre colours were specially used by the Persians for wall-decoration (see TILES), but they also used them on both white and blue enamel grounds to ornament hookah-bottles, bowls, plates, ewers, and tall rose-water bottles. The lustre is generally used alone, and not, as in the Italian majolica, combined with other non-lustre pigments. Its use is very early in Persia: dated specimens exist of the 10th century; and its manufacture has continued down to the present time, though that now made is of a very inferior quality.

Ancient coarse pottery.

2. Coarse pottery covered with a fine white silicious slip, on which arabesques and other simple patterns are painted in black, the whole then covered by a transparent green glaze. This is a very ancient sort of ware, made in Egypt during the XVIIIth Dynasty and many centuries after by Moslem potters, from the early years of their occu-

pation of Egypt down to a very recent period. To this class belong the "bacini" or large dishes with which some

FIG. 45.—Persian ewer, white enamelled ground, with pattern in brown copper lustre; the upper part has a blue ground. The mounting is gilt bronze, Italian 16th-century work. (British Museum.)

of the 12th-century churches in Pisa and other towns in Italy were decorated. They were built in on the outside walls of the campanili, or used in rows to form friezes. In design and method of execution they have nothing in common with Italian majolica, and the oft-repeated story of their being the models from which the Italians learned to make their majolica appears to be a baseless fable.

3. *Sgraffiato Ware.*—These are certain large bowls or Sgraffi-jars decorated in a peculiar way, being covered first with a coating of white enamel and then with a complete coating of brown or deep-blue enamel. The pattern, usually graceful branches of plants with pointed leaves, is formed by cutting through the upper coloured layer down to the white enamel underneath before firing in the kiln. Thus the design appears in white with a coloured ground. The white is, of course, slightly sunk below the coloured layer. Bowls thus decorated are mostly white inside, with a little simple painting in blue, the sgraffiato or incised work being only on the outside.

4. The next class is the reverse of the incised ware in treatment: the whole vessel is covered with brown or blue enamel, and the design, either arabesques geometrically treated or natural sprays of foliage, is painted over it in white enamel, thickly applied so as to stand out in slight relief. This and the preceding class are usually glazed over the enamels, a common Persian practice, to gain additional richness and brilliance of surface. Somewhat akin to this ware in style is a very beautiful sort of pottery with most graceful and delicate designs touched on with a fine brush over a white enamel ground. The pigments are blue, green, grey, and a very rich orange tending to red, and are all thickly but very delicately put on; these pieces are of extreme beauty both in colours and in design. Tall jars, bottles, bowls, plates, and hookah-jars are the vessels usually decorated in this way. Some of the large plates are perfect marvels of decorative beauty of the most refined and graceful kind.

5. *Damascus Ware.*—Under this head is generally included a good deal of Persian pottery made at other places besides Damascus, but of similar style and colouring. It is mostly remarkable for the fineness of its white enamel or slip, its rich glaze, and the beauty of the designs and colours. One class is painted wholly in various tints

of blue, the design being often regular and treated with some geometrical stiffness. Other sorts have in addition a soft olive green, and purple-brown made of manganese (see fig. 46). One of the finest specimens of the ware is

FIG. 46.—Plate of Damascus ware, painted in several tints of blue, a quiet green, and manganese purple. (British Museum.)

a lamp taken from the Dome of the Rock at Jerusalem, and now in the possession of Mr Drury Fortnum, F.S.A. (see fig. 47). It is inscribed in large blue letters with pious sayings of Mohammed, and in small black characters round the lower rim, "In the year 956, in the month Jumádá'l-úla. The painter is the poor, the humble Mustafa." According to our reckoning this date is June 1549 A.D., the year when the Dome was restored by Sultan Suleiman, who was probably the donor of this beautiful lamp. One class of painted decoration used in Damascus ware has flowers treated in a simple way, yet with much natural beauty, such as the rose, hyacinth, tulip, carnation, and others, arranged on large plates and bowls with the most perfect skill and good taste. The plate shown above (fig. 46) is a good example of this sort of design.

FIG. 47.—Lamp from the Dome of the Rock, painted in the same colours as fig. 46. (Collection of Mr Drury Fortnum.)

Rhodian. 6. *Rhodian ware*, so called because it was largely manufactured by Oriental potters in the island of Rhodes, is made of rather coarse clay, covered with a fine white silicious slip, on which the decorations are painted, the whole being then covered with a thick glaze formed of silica, oxide of lead, and soda. Its chief characteristic is the use of a fine red pigment, which owes its colour to

the red oxide of iron. This pigment was applied in very thick body, so that it stands out in actual relief like drops of sealing-wax. Plates, tall bottles, jars, mugs, and pitchers with handles are the usual forms. They are all decorated with patterns of great beauty and splendour of colour, brilliant blues, greens, and the peculiar red being the chief (see fig. 48). The designs are mostly flowers exactly the same in drawing and arrangement as those on the last-mentioned sort of Damascus ware. Other more geometrical patterns are also used, but mostly for wall-decoration. The finest specimens of Rhodian ware date from the 16th and first half of the 17th centuries. Other pieces of this pottery, which appear to have been made for European buyers, have coats of arms or human figures, the latter very coarsely executed, and probably later in date than the purely Oriental designs. The town of Lindus, where ruined kilns yet remain, was one of the chief places in Rhodes for the production of this kind of pottery. With other Oriental wares it was imported into western Europe during the 16th century. Some specimens exist with English silver mounts of the time of Elizabeth, very elaborately wrought. It was probably included under the title of "Damas ware," a name which often occurs in mediæval inventories, and appears to include many varieties of Oriental pottery, all of which were very highly valued in France, Italy, and England during the long period when the native pottery in those countries was of a very rude description. The South Kensington Museum and the Hôtel Cluny in Paris have the finest collections of this magnificent class of Oriental pottery; some very choice specimens are in the British Museum and the Louvre.

FIG. 48.—Rhodian jug.

7. *Pottery made in Persia under Chinese Influence*.—This Perso-Chinese ware includes several varieties more or less strongly Chinese in method of execution or in design. It is recorded that Sháh 'Abbás I., a great patron of all the arts, about the year 1600, invited a number of Chinese potters to establish themselves at Ispahan for the sake of introducing improvements in the manufacture of pottery. Though no hard porcelain like that of China appears to have been made in Persia, several new methods of work were introduced, and a new style of decoration, half-Chinese and half-Persian, was largely used for a long period after the arrival of the Chinese potters.

The main varieties of this Perso-Chinese ware are the following. (1) A sort of semi-porcelain, called by English dealers, quite without reason, "Gombroon ware," which is pure white and semi-transparent, but, unlike Chinese porcelain, is soft and friable where not protected by the glaze. It is composed of silicate of alumina, with free silica, and an alkaline flux; in the heat of an ordinary porcelain furnace it fuses into a transparent glass. It is very fragile, but is of an extremely pleasant texture and slightly creamy tint. It is frequently decorated with simple patterns pierced through the sides of the vessel; the holes are filled up by the transparent glaze which covers the whole, thus forming, as it were, little windows of clear glass. It is also often decorated with painted flowers or

arabesques in cobalt blue and manganese purple. The forms of the ware are small and delicate, mostly cups, plates, bowls, and flower-vases with many necks; these were made from the 17th down to the 19th century. (2) Céladon, very like that made in China, but greyer in tint, is common earthenware covered with a green enamel. It was much valued by the Persians and other nations on account of the belief that a cup of this ware betrayed the presence of poison either by breaking or by changing colour. The Persians call it "jachmi" (jade), from its resemblance to that valuable stone. (3) Pottery of coarse clay, modelled with blunt reliefs, and the whole covered with green enamel. Another variety is covered with a bright blue enamel, chiefly used for ewers, hookah-bottles, and tall jars. The moulded reliefs are either flowers or human figures, poor both in design and execution. This kind of decoration was much used for heavy square bottles or tall jars; it has little or no trace of the usual Persian tastefulness of design, and the colour is harsh. Most of this ware is not older than the 18th and 19th centuries. It is very largely Chinese in style. (4) Pottery painted in cobalt blues on a white ground, with some black, used chiefly for outlines. This is the largest class of Perso-Chinese pottery, and of it were made large dishes, bowls, bottles, ewers, and almost all forms of domestic and ornamental vessels. In some the design is purely Persian, in others almost purely Chinese, while in others the two styles are mingled. The Chinese grotesque dragons and mannered treatment of fir trees and even human figures frequently occur, but the more graceful designs have flowers and foliage arranged with that great decorative skill and good taste for which the Persians are so remarkable. Fig. 49 shows a dish from the South Kensington

FIG. 49.—Persian plate painted in blues only. (South Kensington Museum.)

ton Museum in which there is little or no Chinese influence in the design; it is painted only in blues, and dates from the 17th century. Some few pieces have figures and flowers moulded in low relief, merely indicating the form, and then painted in blues and black lines. On the whole this class of pottery is very decorative in effect; the glaze is thick, and the blues frequently softened by having run a little in the firing; the different shades of blue are very varied and harmonious, ranging from indigo to a deep ultramarine.

Hispano-Moorish Pottery, and Enamelled Lustre Wares produced under Oriental Influence in Sicily and the Balearic Isles.—To the earlier or Arab period of Oriental rule in south-west Europe no existing specimens of pottery can be attributed, though there are sufficient records to show that the Arab potters of Spain, as of other parts of the world, were highly distinguished for their skill and the artistic beauty of their wares. The existing specimens of Hispano-Moorish pottery, which are very numerous, date from the early years of the Moorish occupation, towards the end of the 13th century, and continue down to the 17th century. During this long period three stages were passed through, each with characteristics of its own, but passing imperceptibly one into another,—(1) pottery made by the Moors for their own use; (2) pottery made by

them for the use of their Christian conquerors; (3) pottery made by Spanish potters who imitated the technical methods of the Moors, and to some extent their designs and style of decoration.

Technical Methods, Colours, &c.—The technical methods remained the same throughout all three periods. The process was this. After the pot had been thrown on the wheel, a rather coarse red or yellowish clay being used, it was dipped into a cream-like mixture of the materials for its white enamel coat. This, like the white enamel of Persian pottery, was simply a glass rendered white and opaque by the addition of oxide of tin. When fired, the vessel was covered with a smooth coat of enamel, slightly creamy in colour and very pleasant in texture. Only two colours were used for decoration, and very often only one. The chief of these was a lustre, made with oxides of copper or silver, and varying in tint from a pale lemon yellow to a deep coppery red. The peculiar application of lustre-colour has been described above under the head of "lustred ware" (p. 620). The other colour is a deep indigo blue, varying in tint, and produced sometimes with copper and sometimes with cobalt oxides. The blue was applied before the lustre, which always required a special and final firing under different conditions from those necessary for the fusion of the white enamel and the blue pigment. The chief towns in which the ware was manufactured were Malaga, Valencia, and Manises (in the province of Valencia); the celebrated amphora-shaped vase found in the Alhambra was probably from the first of these places. Ibn Batuta (14th century) describes the beauty of the "gold-coloured pottery" of Malaga, and says that it was largely exported into distant countries. Marineo (*Cosas memorables de España*, 1517) and Ercolano (*Historia de Valencia*, 1610) both praise highly the "gilt pottery" made at Valencia and Manises. The term "gilt" refers to the metallic golden colour of the lustre. Pieces of Valencia ware occur with the accompanying mark (No. 1). The usual forms of this pottery chiefly consist of deep dishes and bowls, jars, drug-pots, goblets, and large bucket-shaped vessels. The early ones, such as the Alhambra amphora, dating from the early part of the 14th century, are decorated with delicate and graceful arabesque patterns, or branches of a plant like the briony, the leaves of which are often alternately in blue and in yellow lustre. A few have Arabic inscriptions. The designs are most masterly, drawn with great freedom of touch, and very decorative in effect. The delicacy and minuteness of the painting are often increased by white lines on the yellow lustre, done with a wooden point by wiping out the lines through the lustre pigment before it was fired; this could be done easily, because the lustre was painted on the hard smooth enamel after it was fired, not on an absorbent biscuit surface.

Potter's mark. No. 1.

The pottery of the earlier period has mostly a lustre of pale lemon yellow made with oxide of silver, while the later and coarser varieties have a deep-red lustre made from copper, which is rather harsh and too metallic in appearance. The decorations of the second period are very frequently heraldic in character. A favourite design for large dishes is a lion rampant or a displayed eagle, the latter used as the emblem of St John the Evangelist, the patron saint of Valencia; others have shields with the arms of Castile and Aragon or of royal personages. Many of the grandly-decorated dishes are not only ornamented on the front but also have their backs elaborately covered with rich and graceful arabesques. Some of this ware is moulded in slight relief; plates have slightly projecting ribs, and goblet-shaped cups have swelling gadroons, a form copied from metal originals. Fig. 50 shows a fine dish, now in the British Museum, painted in copper lustre and blue; though Moorish in style, it has a Spanish inscription, *SENTA CATALINA GVARDA NOS*. The pottery of the third class is very inferior in all respects to the work of the Moorish potters. Not only is the lustre harsh in quality but the designs are very coarse and often rudely executed, though still for the most part retaining strong traces of their Oriental origin. The

mark appended (No. 2) is attributed to the manufactory of Manises, which was very productive in the 17th century.

Balearic
pottery.

In addition to the lusted pottery of this sort made in Spain ware of similar design and execution was produced in the Balearic Islands. Many pieces exist bearing the arms of Inca in Majorca. The beauty of Balearic pottery is mentioned by Giovanni da Uzzano, who wrote a treatise on trade and navigation in 1442. It was also alluded to by J. C. Scaliger (*Exercitationes*, xcii.) in the 16th century. This pottery was largely imported into Italy, where it no doubt influenced the design of some of the so-called "majolica," though it can hardly have originated its manufacture, as has so often been asserted.

Potter's
mark.
No. 2.

Siculo-
Moorish.

Another class of pottery has been attributed to the Moslem conquerors of Sicily, though without much distinct evidence. It is very similar to the Hispano-Moorish ware, except that the lustre is painted over a ground of *blue* not *white* enamel. Some

FIG. 50.—Hispano-Moorish plate, painted in blue and copper lustre.

other pottery, with paintings in blue with black outlines, on a white silicious slip, and covered by a thick vitreous glaze, may be the work of Siculo-Moorish potters. The designs are very bold and effective, often with inscriptions in large Arabic characters, or grotesque horses and other animals, boldly drawn. The attribution of Moslem pottery to special localities is always difficult and uncertain, owing to the great similarity in design and in methods of execution that is always common to Moslem races wherever they may have chanced to settle.

The Kensington Museum and the Hôtel Cluny have the best collections of Persian and Hispano-Moorish wares. The British Museum, the Louvre, and the Archaeological Museum of Madrid have many very choice specimens. Others are scattered through the various museums of Europe.

Other
Moslem
countries.

In other parts of the world, especially among the Moslem people of India, Persia, and northern Africa, very graceful pottery is now made, especially the plain biscuit varieties, in accordance with traditional forms and methods. The common pottery of Egypt is very beautiful in shape and often pleasant in colour and texture; at several places on the banks of the Nile a fine red ware, very like the Roman "Samian," is still largely manufactured, and the water-jars made of the common brown clay are generally fashioned in shapes of almost Hellenic beauty, which seem to have been continually used since the time of the Ptolemies.

Literature.—For the subject of the preceding section the reader may consult Chardin, *Voyages en Perse*, c. 1450 (printed in 1811); Rochemont, *Souvenirs d'un Voyage en Perse*, 1867; Henderson, *Collection of Pottery*, &c., 1868; Fortnum, *South Kensington Museum Catalogue of Pottery*, 1873; Davillier, *Les Poteries Hispano-Moresques*, 1861; and many works on the general history of pottery.

SECTION IX.—TEUTONIC, SAXON, AND GAULISH.

Great quantities of sepulchral urns have been found dating from the departure of the Romans from Britain to the 10th century, but almost no specimens exist of the domestic pottery of this period. The shapes, the character of the clay, and the ornamental patterns on the

cinerary urns are very much the same whether they are Cinerary found in Germany, Scandinavia, Britain, or France: they urns. mostly show traces of Roman influence; some are even coarsely-executed copies of red Samian ware, and are skilfully wheel-made and well fired. Others are very rude, hand-made, and scarcely to be distinguished from the pottery of the early iron age. In the main, however, the urns are much neater, more glossy, and more elaborately ornamented than the prehistoric pottery. They are made of hard well-burned clay, generally grey, brown, or blackish in colour. The decoration is often very elaborate, with incised lines, some arranged in wavy bands, others in wheel-made rings. The most characteristic ornaments are simple geometrical patterns, stars, crosses, the svastika, and others, impressed in the soft clay from wooden stamps (see fig. 51).

FIG. 51.—Saxon cinerary urns; the stamped patterns are shown full size.

Many urns have a ring of bosses pressed out from the inside by the potter's thumb, and some few have bands or stripes in coarse ochre colours or white. The surface of the urns is frequently glossy, partly from the hard silicious quality of the clay, but often because it has been mechanically polished. A black shining surface was sometimes given with graphite (plumbago), as was the case with some of the Roman black pottery. A lump of graphite was found with blackened urns in a tomb at Högelberg.¹

Mediæval Pottery of England and France, 11th to 15th English and French mediæval ware.—Though great quantities of pottery for domestic use were made during this period it was extremely fragile, and, being of very coarse ware, without artistic beauty, few specimens have been preserved to our times. It consisted mostly of tall jugs, globular pitchers, bowls, dishes, and drinking-cups, all of which were made for some centuries with but little variation in shape or quality. Fig. 52 shows a selection of common forms, usually made of coarse red or yellow clay, often covered with white slip, and partly glazed with a green or yellow vitreous glaze, rendered more fusible by the

presence of a large proportion of oxide of lead. Some have stripes in coloured ochres; others have heraldic badges or fanciful ornaments, rudely modelled, and fastened to the body of the pot; and some grotesque jugs are formed in

FIG. 52.—Common forms of mediæval pottery; the upper part of the slender jug is covered with a green vitreous lead glaze; the other is unglazed with stripes of red ochre.

the shape of animals or knights on horseback. The most graceful in shape were pilgrim-bottles, flattened globes, very like one of the forms common in Egyptian and Assyrian pottery. The common domestic pottery of the Middle Ages was made and used in enormous quantities. Though it was wonderfully cheap, yet the ease with which it was broken made it a serious and often-recurring item in the household expenses of rich or royal personages. The list of expenses of a feast on the anniversary of Queen Eleanor's death (wife of Edward I.) contains this item, "pro M^o et D discis, tot platellis, tot salseriis, et CCCC chiphis xliis,"—that is, 42s. for 1500 dishes, 1500 plates, 1500 saucers, and 400 cups. The 42s. are perhaps equal to £25 of modern money, a small sum for 4900 pieces of pottery.

SECTION X.—MEDIEVAL AND MODERN ITALIAN.

Sgraffiato ware. *Sgraffiato* Ware was made by covering a vessel of red clay with a coating of white slip made of some natural white earth like pipeclay. This was done by dipping or by pouring the fluid slip over the red vessel. When the white coating was dry the design was formed by cutting it away so as to expose the red body underneath. In this way bowls, dishes, ewers, and other vessels were decorated with human figures, or with graceful scroll-patterns of foliage and flowers. The patterns were then picked out with bright colours,—yellow, blue, and green; and finally the whole was glazed with a very fusible lead glaze (see fig. 53). This is probably a very early method for the

FIG. 53.—Italian sgraffiato plate, 16th century. (South Kensington Museum.)

decoration of pottery in various parts of Italy; but only few existing specimens are older than the second half of the 15th century. Some of the earlier specimens have very graceful designs, of almost Gothic style, executed with great spirit, and very decorative in effect. Sgraffiato ware continued to be made during the 16th and 17th centuries, especially in the neighbourhood of Pavia; it was, however, but little esteemed owing to the greater popularity of painted majolica. Rude imitations of it were made in Germany and France.

Majolica. *Italian Majolica*.¹—The history of this ware in its early stages of development is almost unknown. According to popular tradition, it was first copied from certain plates brought by the Pisans from the island of Majorca (or Majorca) in the 12th century. This is extremely improbable; the fabrication and use of a white tin enamel were

¹ In this article the word "majolica" is used in its modern sense to include non-lustred pottery.

known to Italian potters long before they found out the secret of lustre colours, a discovery not made in Italy till the 15th century. We know from various sources that lustred pottery from the Balearic Islands was largely imported into Italy during the 15th century (see above), and it is quite possible that the sight of the brilliant lustre on the imported Moorish ware set the potters of Italy to work, and led them to find out, either by experiments or from some traveller who had visited the Balearic kilns, how to compose and fire the metallic salts required to produce the lustre; but this occurred long after the Pisan victory at Majorca. It was to the lustred ware only that the Italians gave the name of "majolica," though now it is commonly applied to all the Italian enamelled pottery of the 15th and 16th centuries. It was the lustre only that was a fresh discovery in the 15th century; enamelled ware had been made by Italian potters many years before. This is an important point, and it should be noted that the accounts given by Vasari and several other old Italian writers on the subject are quite misleading. "Mezzamajolica" is a word of rather uncertain meaning which occurs in early writers on Italian pottery. It has been used to mean pottery covered not with a tin enamel but with a white slip, made of a white clay like that found at Vicenza; and in many museums the earlier and ruder sorts of majolica have been arranged under this name. The fact, however, seems to be that even the rudest and earliest specimens of majolica in the various museums of Europe are covered with a true tin enamel. Curious specimens of pottery, covered with a rude enamel made of the white kaolinic "terra di Vicenza" mixed with an alkaline silicate, have recently been found in tombs of the 11th and 12th centuries in various parts of Italy. These earliest attempts at what we now call majolica are coarsely decorated in green, yellow, and blue, on a white ground, with patterns of semi-Oriental style. The pigments used appear in some cases to be simply coloured glass reduced to powder,—a kind of *smalto*. This style of pottery is probably the mezza-majolica of Vasari. It is evidently the first step towards the production of the true majolica, in which the kaolinic clay of Vicenza is replaced by a tin enamel. This discovery is of great importance as regards the early history of Italian pottery. The few pieces yet known are mostly preserved in the office of public instruction in Rome, and are not yet exhibited in any museum.

Very few early examples of developed Italian majolica are now known. One of the most important is a small jug, 5 inches high, in the Sèvres Museum, which is made of reddish clay covered with a white tin enamel, and painted with a shield and simple ornaments in manganese purple and bright green (oxide of copper). It is supposed to have been made at Rimini, and dates from the 13th or 14th century (see fig. 54). It was not, however, till the second half of the 15th century that Italian majolica began to be largely produced. Owing to the great difficulty of determining the special towns where the earlier varieties were made, it will be convenient to treat this ware according to style and date rather than under the heads of the different potteries. During the earlier and more important period the production of majolica was confined to a very small part of Italy. Bologna on the north, Perugia on the south, Siena on the west, and the Adriatic on the east roughly indicate the limits within which the chief majolica-producing towns were situated; these were Forlì, Faenza, Rimini, Cafaggiolo, Pesaro, Urbino, Castel Durante, Gubbio, Perugia, and Siena. Towards the middle of the 16th century distant

FIG. 54.—Ewer of Rimini ware, probably the earliest known specimen of Italian majolica. (Sèvres Museum.)

cities such as Venice also produced fine majolica, but of the later style.

Materials.

Materials.—Fortunately ample information on this subject has been preserved to us. A potter of Castel Durante occupied himself for some time in writing a full description of the materials, the methods of using them, the "throwing-wheels," the kilns, and all the varied processes of his craft. His original MS., copiously illustrated with clever pen-sketches, is in the library of the South Kensington Museum, and the work was printed, with facsimiles of the drawings, at Pesaro in 1879. It is called *I tre libri dell'arte del Vasajo* by Cipriano Piccolpasso of Castel Durante, and is dated 1548.

Piccolpasso himself did not produce lustred ware, but he describes the process and the special kiln it required; his description of materials and methods, though not written till 1548, applies in all important points to the majolica of the second half of the previous century. Various receipts differing in the proportions of their ingredients are given; the following examples are selected as typical instances.

1. The clay body, "terra," was to be, if possible, clay deposited by a river. It was carefully prepared for use by being beaten, ground in a mill, and passed through a sieve, so as to bring it into a smooth homogeneous plastic state, fit for being moulded on the wheel. It was all the better for being dug out a long time before it was used.

2. The white enamel, "bianco," was composed of thirty parts of "marzacotto" to twelve of oxide of tin. The marzacotto was simple powdered glass, a pure silicate of potash, made from clean sand and the alkaline tartar deposited by wine. According to Piccolpasso the decorations were painted on the enamel ground sometimes *before* it was fired, and sometimes *after*. This was an important difference. The enamel *before* firing formed a slightly granular and very absorbent ground, like clay in the biscuit state; and the paintings on it had to be bold and broadly decorative, not delicate and miniature-like; the touch of the brush had to be rapid and certain; little or no alteration could be made, as the unfired enamel sucked the pigment out of the brush and absorbed it below the surface. The earlier and more boldly decorative sorts of majolica appear to have been painted in this way on the unfired enamel, and owe much of their richness of effect to the fact that the different pigments have sunk below the surface of the ground. This process may be compared to that of painting in true fresco, while the painting on the fired enamel resembles the more deliberate method of the painter in oil. After passing through the kiln the whole character of the enamel was completely changed; it formed then a hard, smooth, non-absorbent, vitreous surface, on which the finest lines and the most minute paintings could be executed, and any part of it could easily be altered or wiped out. It was in great part owing to this change of method that the later majolica paintings became pictorial and more minute in execution, the almost inevitable result of painting on a hard glassy ground. In some instances it is not easy to decide which method of painting has been adopted, though in most cases there is a distinct difference in the quality of the lines. One peculiarity is a sure test: when delicate patterns in white have been formed by covering the enamel ground with some colour, and then *wiping out* the pattern by using a pointed piece of stick or ivory on the soft pigment, in that case the enamel certainly was fired first. The colour could not be wiped cleanly out from an absorbent biscuit surface. Much of the delicate beauty of the Persian lustre paintings, especially those on wall-tiles, is due to this method of getting minute patterns in white. It was also practised, though in a much more limited way, on some of the Italian majolica. The difference of handling between "under-glaze" and "over-glaze" painting corresponds exactly to that of the unfired and fired enamel; but in the latter case another important difference is introduced: under-glaze pigments require much greater heat than those over the glaze and are consequently very limited in range of colour, while in majolica painting the same pigments were used in either case.

3. The glaze, "coperta," an ordinary glass, made more fusible by the presence of lead, consisted of oxide of lead 17 parts, silica (sand) 20, alkali 12, and common salt 8 parts.

4. Pigments, "colori," all owe their colour to a metallic oxide, yellow being derived from oxides of iron and antimony, green from oxides of copper and antimony, blue from oxide of copper, red from Spanish oxide of iron, Armenian bole, and red ochre, and black from black oxide of copper and manganese. Most of these had a certain proportion of oxide of lead, not to affect the colour but to make them more fusible. Other tints were produced by combinations of these pigments, and different gradations of tone were obtained by adding more or less of the ingredients of the white enamel.

Methods of Manufacture.—Piccolpasso gives sketches of the

pottery at work throwing vessels on the wheel. The wheel itself *Manu-* ("torno") consists of a vertical axle, with a large lower wooden *facture*. disk for the potter's foot to keep it revolving, and a smaller upper disk on which the clay was moulded by the potter's hands,—an apparatus which differs in no respect from that used in Egypt under the Ptolemies, and is still employed in the great porcelain factory at Sèvres. The potter to the right of fig. 55 is working with a wheel like that drawn by Piccolpasso. The earlier kind of majolica is almost wholly wheel-moulded, but during the 16th century a good many plates and vases were formed after shapes copied from silver-work, with sunk bosses or gadroons. These were formed by pressing thin disks of soft clay into moulds made of plaster ("gesso"), bone-ash, and pounded marble. An elaborate description of the method is given in Piccolpasso's MS. Another practice also had arisen in his time, that of finishing the pottery on a joiner's lathe when it was dry, but before it was enamelled or fired,—a practice unfortunately common at the present day, which makes the form of the vessel more mathematically correct, but greatly injures the freedom and spirit of touch given by the potter's hand. After the pottery was brought to the required shape it was dipped into a bath of the materials for the white enamel, finely ground and mixed with water; and, after being allowed to dry, it was fired for the first time. The painted decoration was applied on the white enamel with brushes of various sizes, and the vessel was then dipped into a second bath of the glaze materials, finely ground and mixed with water like the enamel. It was afterwards fired a second time. If it had lustre colours, they were put on over the glaze, and a third firing in a different kiln was necessary for the reasons explained above under the head of "Persian pottery." The application of the transparent glaze over the enamel was not absolutely necessary, and was occasionally omitted, but the finer sorts of majolica usually had it for the sake of the increased brilliance which it gave to the non-lustre colours. The kiln for the ordinary colours and first two firings, as drawn by Piccolpasso, is exactly the same in principle as that used by the potters of ancient Greece and Rome,—that is, an arched chamber in two stories, with a perforated floor between—the lower compartment for the fire, the upper for the pottery. A sketch is also given in Piccolpasso's MS. of the lustre-kiln, in which the pottery is enveloped in flames and heated smoke. Fig. 55, from a Venetian woodcut of the middle of

FIG. 55.—Two forms of Italian potter's wheels, about 1540.

the 16th century, shows majolica potters at work throwing pots on the wheel. Two different wheels are being used; the man on the left keeps his going by giving it a succession of spins with one hand, the other works his wheel by the help of a lower foot-turned disk. To the extreme left a small kiln is shown; the lower arched opening is for the insertion of the fuel, the upper for the pottery; the holes at the top are for the escape of the heated air and smoke.

Styles of Decoration.—In general character the painted decoration on the majolica of the latter part of the 15th century, and beginning of the 16th century is very different from that of a few years later. The first retains much of mediæval purity and simplicity of design, while the later sort follows the richer and more florid style brought into fashion by the rapidly-approaching decadence of art. The principal variety of the early class is the ware painted in blues with a yellow lustre, manufactured chiefly in the workshops of Pesaro, Gubbio, and Deruta. With these two simple colours effects of the greatest decorative beauty were produced, far more truly artistic and suited to their special purpose than the elaborate pictures in many colours painted some years later in the workshops of Urbino and Durante. In the firm precision of the drawing and extreme skillfulness of touch in the blue outlines one is reminded of the paintings on Greek vases of the best period. Some of the large plates of this ware have

figure-subjects, usually sacred scenes. A very beautiful one in the Louvre has a Madonna and Child enthroned, drawn and composed with the simple grace of Raphael's early manner. Most, however, have portraits of ladies drawn in profile, the background filled up with simple flowers, and an inscribed scroll, often with the lady's name and the word "bella" or "diva," or with epigrammatic mottoes (see fig. 56). The design is first drawn in

FIG. 56.—Early majolica plate, in blue and yellow lustre only, made at Pesaro or Gubbio, c. 1500. The motto on the scroll is "Chi bene guida sua barcha s'entra in porto" (He who steers well his ship will enter the harbour). (Louvre.)

blue outline, with a little delicate blue shading over the white flesh and a blue edging on the ground round the outline. The dress and the ornaments on the ground and rim of the plate were finally filled in with the yellow lustre, which was sufficiently transparent to let all the blue line details over which it was painted show through. Another rarer sort of early majolica, similar in style, has a deep ruby lustre, employed instead of the golden yellow. Fig. 57 shows a fine example of it, probably

FIG. 57.—Gubbio plate, with portrait in ruby lustre and blue outline. (South Kensington Museum.)

produced at Gubbio, which had almost a monopoly of this special lustre, afterwards used so largely in the workshop

of Maestro Giorgio. Other early varieties of majolica, painted in a simple and unpictorial way, have no lustre colours, but are remarkable for their brilliant and rather harsh green, with a good deal of manganese purple. Plates of this sort with female portraits, not generally in profile, and heraldic animals, frequently occur, as well as slabs or plaques intended for wall-decoration. Faenza and Forl appear to have been the chief places for their production. The

Cluny Museum is very rich in specimens. Cafaggiolo and Faenza also produced, during the early period, some very beautiful and highly-decorative plates, painted without lustre, but with a variety of colours arranged with a most complete harmony of tint. Some have patterns ingeniously devised after a motive suggested

FIG. 58.—Early Faenza plate, with peacock-feather design, in blues, yellow, and orange-red. (South Kensington Museum.)

by peacocks' feathers (see fig. 58). The chief colours are yellow and orange, various blues, and occasionally a rich deep red. Amatory plates ("amatorii"), with ladies' portraits, are also painted in this way, with more elaboration and detail but not greater decorative beauty than the simple blue and yellow lustre of the early Pesaro and Gubbio ware. Specimens of the later Cafaggiolo ware bear the accompanying mark (see No. 3). Forl was one of the earliest towns to produce a fine class of majolica; specimens exist dated 1470, of very noble design and firm outline. A fine set of plates and vases was made there (c. 1480-85) for Matthias Corvinus, king of Hungary. The flesh of the figures, like that on the early Pesaro and Deruta ware, is white, delicately shaded with blue; but the early Forl potters used a greater variety of colours than were employed at most other towns: in addition to the blues they had yellow, bright green, and purple-brown, all non-lustre colours. To Forl or Faenza must be attributed a very curious and rudely painted plate in the Sèvres Museum, decorated with a youth on horseback in blue outline; it has a date which appears to read 1448; if so, this is the earliest dated specimen of majolica. The enamel is coarse and cracked all over, but the method of execution is that of true majolica.

Majolica of Maestro Giorgio Andreoli of Gubbio.—The Giorgio workshop of this artist, most of whose dated works fall between 1517 and 1537, was one of the largest and most important of his time. Its productions, as well as those with the signature "M^o G^o da Ugubio," or as in No. 4, are

No. 4.

No. 6.

Potters' marks.

very unequal in merit, and even the best of them are very inferior as specimens of true decorative art compared with the majolica of the earlier classes described above

The mark used most frequently by Giorgio is shown in No. 5. A somewhat similar monogram was used by an earlier potter; an example dated 1491 is shown in No. 6. Though not the inventor of the ruby lustre, which was then so much admired, Giorgio appears to have been the chief potter of his time who used it. The fact is, the process was a difficult one and required special skill, not in the preparation of the oxide of copper pigment but in the firing, so as to expose the colour to actual contact with the reducing flame without the pottery itself being shattered to pieces. Even with the best skill of the Gubbio potters a large proportion of the lustred ware perished in the kiln. The majolica potters of many other towns were in the habit of sending their otherwise finished wares to Gubbio for the sake of having the additional brilliance derived from lustre colours. In some cases a space for the lustres was left white; in others rude dabs and splashes of ruby and yellow lustre were applied over completely finished paintings of landscapes or figure-subjects, often in a very coarse and tasteless fashion. Some delicately painted plates are quite spoiled and vulgarized by the heavy touches of lustre that have been put over them. The ruby is in fact rather strong and hard in tone, and needed very careful application to make it harmonize with the quieter non-lustre colours; it is far more salient and metallic-looking than the fine yellow lustre of the early ware. In addition to the ruby, "gold" and "silver" lustres were used at Gubbio. The latter are a deep and a pale yellow. The pale silver lustre was made from oxide of silver; the gold was a mixture of copper and silver oxides. A great deal of the produce of Giorgio's workshop is very rude and of no artistic merit, while the best and most carefully painted wares usually err, in accordance with the rapidly declining taste of his time, in being far too pictorial. Copies of pictures crowded with figures, arranged without regard to the shape of the vessel they were meant to decorate, and painted with all the colours of the potter's palette, were most highly esteemed. Many of them are from designs by Raphael and other great painters, but are really quite unsuited for ceramic decoration. Giorgio's earlier works are, on the whole, in better taste, and some later portrait heads are very good. Fig. 59 shows a fine tazza in the Louvre signed at the back

"ex o.¹ Giorg.," which is both nobly drawn and harmonious in colour; its date is about 1525. The favourite subjects on the pictured ("istoriata") majolica of Gubbio and elsewhere are scenes from Roman mythology, especially Ovid's *Metamorphoses*, and stories from classical history. Unluckily contemporary history is rare; the British Museum has a good specimen, a plate painted with the defeat of Francis I. at the battle of Pavia.

It was at Urbino and Castel Durante that the production of elaborate pictured majolica was mostly carried on,

¹ For *ex officina*, a phrase borrowed from the Roman potters' stamps, see p. 619 *supra*.

especially between the years 1530 and 1560, under the patronage of the reigning dukes of the Della Rovere family. Francesco Xanto Aveli, Guido Fontana, and Niccola da Urbino were specially celebrated for this class of work, and often used Marc Antonio Raimondi's engravings from Raphael's designs to decorate their plates and vases.² Many of these are painted with great delicacy and richness of effect in spite of their unsuitability for their special purpose and the comparative poverty of the potter's palette, which was, of course, limited to colours that would stand the severe heat of the kiln. The pictured wares of Urbino sometimes have the Gubbio lustre colours, but the best are without them. Another class of design was also used at Urbino with much better decorative effect. It consisted of fanciful and graceful arabesques or floral scroll-work mingled with grotesque figures or Cupids, all skilfully arranged to emphasize the main contours of the plate or vase. Branches of the oak tree in flowing and slightly geometrical lines are a frequent motive of design, chosen in compliment to the Della Rovere dukes, who bore an oak on their coat of arms. All these, but especially the pictured wares, were highly paid for, and sometimes were valued as much as silver plate. They were mostly "piatti di pompa,"—meant, that is, to hang on walls or ornament sideboards rather than for actual use. Some of the early productions of one of the Urbino potteries are marked with the graceful monogram No. 7.

In a short sketch like this it is impossible to give even an outline of the many varieties of majolica produced in such profusion during the 16th century, but a few others of the more important kinds may be mentioned. The Faenza potteries produced one of the most beautiful of the later varieties, chiefly plates with wide flat rims and deep centres, called "tondini," the borders decorated with delicate and minute arabesques, painted in several tints of a deep ultramarine blue of wonderful richness and decorative effect. In the centre is usually a coat of arms or a single figure, with a brilliant jewel-like touch of orange or deep red, which sets off to the utmost the blues of the border (see fig. 60). One of the most remarkable specimens of majolica painting, treated with the delicate minuteness of an illuminated MS., is on a plate in the British Museum from the Faenza workshops. It is a scene of the death of the Virgin, surrounded by the apostles, copied with slight adaptations from an engraving by the German master Martin Schongauer. The Italian ceramic painter has slightly but skilfully altered the composition to fit it to the circular form of the plate, and has also given a more graceful cast to the mannered German faces of the original. The execution is wonderfully delicate and miniature-like, almost wholly done in different tints of blue, with a little yellow to suggest flesh colour, and high lights touched in with pure white enamel, the main enamel ground being white slightly tinged with pink. It is evidently the work of a very able artist, and is a little picture of gem-

FIG. 60.—Faenza plate (tondino), with border in deep ultramarine blues, and central coat of arms in rich orange and red. (South Kensington Museum.)

2 A namesake and relation of Raphael's was a skilful painter of *istoriati* pieces; and hence has arisen the tradition that the great painter occasionally decorated majolica (see RAPHAEL).

like beauty, though in no way specially suited to the requirements of ceramic art, for which a bolder and less realistic style of treatment is really the most suitable. Some fine early plates of Faenza make are signed with No. 8 mark; a common later mark is the monogram FA(enza)—see No. 9. Another plate, also in the British Museum, has a painting copied from a design by Albert Dürer, the Scourging of Christ. This highly-laboured and minute style of painting was largely practised in the potteries of Siena, which produced plates of great beauty, with borders of graceful scroll-work and grotesques in white and different tints of blue, with usually a rich russet-brown or orange ground. Tondini from Siena are often decorated in this way with a central medallion containing a minute landscape, painted with wonderful minuteness and finish. The landscapes are very delicate in colour, and, though often not more than an inch and a half in diameter, have a wonderful suggestion of atmosphere and distance which recalls the lovely sunset-lit backgrounds of Perugino's pictures. A very beautiful plate in the British Museum, painted in this minute style with the scene of Scævola before Porsena, is signed on the back, "fata i Siena da M^o Benedetto." Other plates by the same very clever and refined painter are decorated only in blue, with touches of pure white on the creamy enamel ground. The Kensington Museum has a good specimen, with a central painting of a hermit and landscape background, surrounded by a delicate border of arabesques. Little is known of the artist. Another signature which occurs on Siena ware is No. 10, in one case conjoined with the date 1542. Majolica with plain

blue enamel is a rare variety, and has been attributed to Luca or Andrea della Robbia, some pieces being marked as in No. 11, apparently for "Luca della Robbia, Florentia." It has no painting, but was partly gilt; in colour the enamel resembles the plain blue pottery of Persia mentioned above. It consists mostly of vases moulded with flutings and bosses after a metal design; very few pieces exist. The beautiful sculpture in enamelled terra-cotta made by the Della Robbia family will be treated of under the head of ROBBIA.

Venice.

Venetian majolica was not largely produced till towards the second half of the 16th century. In the earlier part of that century the few potters of Venice appear to have chiefly occupied themselves with attempts to produce true porcelain. The earliest dated specimen of Venetian majolica is of the year 1540. Some of this ware is very decorative in effect, and has paintings of graceful and elaborate foliage, scroll-work, and arabesques, designed with great intricacy. It is in blue and white, the main enamel ground being

a very pale blue, and the design in deeper shades of blue with high lights in pure white. Others have landscapes in blue and white, with graceful, but too realistic borders of fruit and flowers in yellow, green, and blue, somewhat later in style. Mark No. 12 occurs on some of the finest Venetian majolica. Towards the end of the 16th century there was a rapid falling off in the artistic beauty of majolica paintings, and not solely in the execution: the pigments also became thin and poor, with very often a disagreeable "granular" look. Some effective pottery was produced at Venice, c. 1590-1620, with a deep ultramarine blue enamel ground, on which designs were painted in white, a style of ware which was largely manufactured at Nevers in France a few years later (see fig. 62 below).

Potter's mark. No. 12.

Later majolica.

All through the 17th and 18th centuries majolica in a degraded form was produced at many places in Italy; but most of the old kilns, such as those of Deruta, Gubbio, and Faenza, fell into disuse. The latest kind of majolica, decorated with coarse paintings in blues and yellows of rather harsh tint, was largely produced at Turin, Genoa, Venice, Savona, Castello, Naples, Montelupo, and other cities. The older potteries at Pesaro and Urbino still continued in work, but produced nothing of real merit. A common mark on Turin ware is No. 13; and on Savona majolica one of the two forms in No. 14 often occurs. In the beginning of the 17th century spirited copies were made of the magnificent Rhodian pottery, such as that shown in fig. 48 above, but with pigments very inferior

to those of the originals. At Capo di Monte, near Naples, a manufactory of pottery and porcelain was started under royal patronage in 1736; but it was more celebrated for the production of porcelain than of enamelled wares. Of late years clever imitations of the old majolica have been produced in Italy, especially from the workshop of the marquis Ginori. Even the old lustre colours are successfully reproduced; but most of the modern majolica is marred by a want of spirit and freedom, the natural result of its being a too servile copy of a bygone style.

No. 14.

Shapes of Majolica.—The most carefully finished and finest paintings are as a rule on plates, which were of various forms, from almost flat disks to the tondini with wide flat rims and deep bowl-like centres. Many of the jugs, vases, and ewers are extremely graceful in form, some suggested by the bronze vessels of ancient Rome, others taken from Greek vases. Piccolpasso gives sketches of the principal shapes, and a long list of special names, not now of much importance, as they varied in different manufactories and even workshops in the same town. The character of the non-pictorial decorations combines many different elements of style. In some of the patterns we see a survival of earlier mediæval and native Italian taste and invention. Others, especially the large ewers of Cafaggiolo and Faenza, have flowers taken from Persian pottery, but treated in a thoroughly original way. Some plates, painted in the silver lustre only, are almost imitations of Hispano-Moorish ware or actual majolica made in the Balearic Islands. In all the scroll-patterns, mingled with grotesques, it is easy to trace the influence of the ancient wall-decorations from the baths of Titus and other buried buildings, the discovery of which at the beginning of the 16th century did so much to destroy the lingering mediæval spirit and substitute a pseudo-classical style, which finally had so fatal an effect on all branches of art in Italy.

Collections.—The chief collections of the majolica of Italy are those of the South Kensington Museum (perhaps the most completely representative of all), the Bargello in Florence, the museums of Milan, Venice, Turin, Pesaro, Urbino, and other places in Italy. The Hôtel Cluny and the Louvre in Paris, the Ceramic Museum at Sèvres, as well as Limoges, Berlin, Vienna, Munich, and St Petersburg, have good collections. The British Museum collection is not large, but it is one of the most important, from the number of "signed" pieces that it contains, and from the fact that nearly all its specimens are remarkable for their exceptional beauty or some point of special interest.¹

Literature.—For Italian majolica, see Vasari, *Lives of Battista Franchi, Buon-talenti, and Luca della Robbia* (ed. Milanese, 1882); Meurer, *Italianische Majoliken-fleszen*, 1881; Corona, *La Ceramica*, 1879; Vanzolini, *Istoria delle fabbriche di Majoliche*, Pesaro, 1879 (a most valuable reprint of the best old treatises on the subject, including Piccolpasso's illustrated MS.); Darcel and Delange, *Faïences Italiennes*, 1864; Fortnum, *South Kensington Museum Catalogue of Majolica*, 1875; Jacquemart, *Les Majoliques de la collection d'Ampana*, 1862, also article in *Gaz. des Beaux-Arts*, xiii. p. 289; Drake, *Antiquarian Ceramics*, 1868; Lazari, *Notizia della raccolta d'orrevi*, 1859; Raffaelli, *Majoliche trovate in Castel Durante*, 1846; Bonghi, *Majoliche di città di Castello*, 1836; Casati, *Les Faïences de Deruta*, 1874; Campori, *Majoliche di Ferrara*, 1871; Delsotto, *Majoliche di Pesaro*, 1845; Frati, *Majoliche di Pesaro*, 1844; Tortorelli, *La Majolica Savonese*, 1856; Pungitoni, *Pittura in Majoliche di Urbino*, 1857; Brancaccio, *Maestro Giorgio di Gubbio*, Pesaro, 1857. For information on the marks on majolica, see Genolini, *Maol. Ital., Marche e Monogrammi*, Milan, 1881; and De Mely, *La Ceramique Ital., Sigles et Monogrammes*, Paris, 1884. Many valuable articles on majolica are scattered through the volumes of the *Gaz. des Beaux-Arts*.

SECTION XI.—SPANISH AND PORTUGUESE.

Spanish.—Spanish pottery is for the most part a coarse Spanish imitation of Italian majolica, chiefly made at Valencia, pottery. Triana (Seville), and Talavera. Some of the enamelled ware made at the last-named town is elaborately painted with figure-subjects in blues, yellow, green, and manganese purple, of extremely bad taste and feebleness of drawing.² The simpler pottery made at Valencia a little before and after the year 1700, though rudely painted, is very decorative in effect. Large plates often have conventional flowers or profile heads, somewhat after the style of some of the earliest majolica of Italy, and are coarsely painted in blue and yellow. In the 18th century good enamelled pottery

¹ The year 1884 will be memorable in the history of majolica for the sale and dispersal of the important collection formed in the 18th century by Sir Andrew Fountaine of Narford. A few specimens were secured for the South Kensington and British Museums, but some of the finest pieces were bought for France, especially a magnificent Faenza plate, dated 1508, which fetched £966. Several of the Pesaro and Urbino dishes sold for between £200 and £300.

² See Casati, *Les Faïences de Talavera*, 1874.

was made at Alcora, painted only in blues, often in the Chinese style. Some large vases of Moorish shape have very effective blue and white paintings of animals, flowers, and landscapes.¹ A quite different style of enamelled pottery was made at Puente del Arzobispo in the 16th or 17th century. Specimens are rare; they consist chiefly of plates decorated in a very skilful and effective way, somewhat after the fashion of Moorish wall-tiles, "azulejos" (see **TILES**). They are made of coarse red clay covered with white enamel, through which (before firing) the outline of the design was scratched down to the red body. The spaces between the incised lines were filled in with coloured enamels, rich blue, green, and orange, and the whole glazed with a very fusible lead glaze. The simple and mosaic-like patterns thus formed, either conventional flowers or heraldic animals, are extremely decorative and telling.

Portuguese.—Little or no enamelled pottery of Portuguese workmanship earlier in date than the 17th century is known to exist. Rato was one of the chief places for the manufacture of enamelled wares, which are coarsely painted, like the latest and poorest kinds of Italian majolica, and are not earlier in date than 1767, when the Rato potteries were first started. Other earlier specimens of unknown make also exist, and are marked with an "R," like the Rato ware, to which they are very superior both in design and execution. The best are in blue and white only; many are marked with various dates during the 17th century.

Biscuit wares. *Biscuit Pottery of Spain and Portugal.*—The earliest kinds now existing of Spanish pottery without either enamel or glaze are chiefly large wine-jars, "tinajas," about 3 or 4 feet high, of graceful amphora-like shape, stamped with simple patterns in relief. Some of them date from the time of the Moorish occupation. Both Spain and Portugal have always been remarkable for the fineness and beauty of their potter's clays, and consequently have for long excelled in the production of simple biscuit wares, uncovered by either enamel or glaze. Very graceful pottery of this sort is manufactured even at the present day, the shapes being traditional, handed down from century to century with but little change, many vessels being still modelled after the old Roman forms. Some of this ware is of a white porous clay, like pipeclay, and some is of a fine red, close in texture, with slight surface gloss, almost like the Roman "Samian." One common kind is decorated in a very fanciful and ingenious fashion by the application of simple but rich surface ornaments, modelled by hand in relief, or applied in the state of semi-fluid slip. Other curious water-jars are made double, the outer vessel being pierced with patterns of open-work. A third variety has sparkling particles of quartz stuck on its surface while moist, a very old method of decoration, which was even practised by the potters of prehistoric times. On the whole, the modern biscuit wares of Spain and Portugal are among the most truly artistic and interesting of any that are now made in Europe. It is still a living art, with simple beauty both in material and shape, not a laboured revival of a dead style, or dull copy of the artistic productions of a far-off time when fitness linked with grace came naturally to the humblest workman.

SECTION XII.—FRENCH FROM THE 16TH TO THE 18TH CENTURY.

During the 16th century two very different but equally remarkable sorts of pottery, decorated with great elaboration, were made in France. One was that invented and manufactured by Bernard Palissy, which was a fine earthenware, usually modelled in relief, covered with a white tin enamel, and painted with many bright colours (see

¹ See Riaño, *Spanish Handbook*, South Kensington Museum, 1879.

PALISSY. The other, Oiron pottery, popularly called Oiron "faience Henri deux," is very different both in design and pottery execution. This rare and curious ware, of which only about forty pieces are known, was made by a potter called François Cherpentier for his patron, a rich and artistic widow lady, named Hélène de Hangest, who established a workshop and kiln at her Château d'Oiron, in the province of Thouars, between the years 1524 and 1537. The manufacture was carried on by Hélène de Hangest's son for some years after her death, but the pieces then produced are inferior in quality, and soon ceased to be made at all. This ware is not enamelled; it is simply a fine white pipeclay, to which a delicate cream-tint is given by a very slight tinge of yellow in the lead glaze. Its forms are very elaborate, sometimes extremely graceful, but occasionally too fanciful, and overloaded with ornament. It consists of plates, tazze, holy-water pots, ewers, salt-cellars, and other varieties of shape, generally forms more suited to metal than to clay, ornamented with very graceful interlaced strap-work and arabesques, such as were much used by the great Augsburg and Nuremberg workers in silver. The method in which many of the ornaments are executed is the chief peculiarity of the ware: they are first incised or stamped into the soft clay of the vessel, and then the sunk patterns are filled up with different clay pastes, tinted with dark brown, soft yellow, or buff. Many of the delicate leaf-ornaments appear to have been formed with a metal stamp; some are exactly the same as those used by contemporary bookbinders. The ornaments are not all done in this laborious manner; some are simply painted under the glaze, especially on the later productions of Oiron. Monograms and emblems occur frequently, the salamander of Francis I., the "H. D." for Henri deux, the royal interlaced crescents, or coats of arms (see No. 15). Fig. 61 shows a beautiful covered tazza in the Louvre, made during the reign of Francis I.

There are eleven pieces of this ware in the Louvre; the Kensington Museum has five; but the greater number of known specimens are in the possession of members of the Rothschild family. It was at one time thought to be the production of a pottery under the patronage of Henry II., and hence the name by which it was formerly known; but its real origin was established

from clear documentary evidence published in M. Fillon's valuable monograph on the subject.

FIG. 61.—Tazza of Oiron pottery. (Louvre.)

Throughout the period we are now considering enamelled pottery was produced at a very large number of French towns, often with the help of potters from Italy; and the introduction of the tin led enamel soon superseded the earlier sort of ware with a bright green pottery, or blue glaze, which at the end of the 15th and beginning of the 16th century was the chief and most artistic kind of pottery that was made in France. The change was not wholly a gain, as pieces of the older ware were moulded in relief with designs of great beauty

Potter's mark. No. 15.

—mostly Gothic in feeling—especially those made at Avignon, Savigny, and Beauvais; the reliefs on the older French ware are very delicate and sharp, and often of great decorative effect. Nevers was one of the chief manufactories of enamelled ware; from about 1570 to the end of the 17th century it produced mostly poor copies of the later sort of Italian majolica. After that a strong Oriental influence set in, and a peculiar ware with a deep-blue enamel ground was made, very like that produced by the Venetian potters. Some of this, painted in white enamel only, with Persian designs, is effective and pleasant in colour (see fig. 62). Other pieces have flowers, treated in a more realistic way, painted in harsh yellow, green, and red, quite out of harmony with the rich blue ground. J. Bourdu, a potter working at Nevers from 1602 to 1620, signed his ware with mark No. 16; another, named H. Borne, used No. 17. During the 18th century Nevers chiefly produced pottery of Chinese forms, painted in blue with Chinese figures and flowers, and also a large quantity of pottery painted in many colours with coarse designs, somewhat after the Delft style. The 17th-century enamelled pottery of Rouen is the finest of the later French wares. It is mostly painted in rich red and blue only, with very minute and well-designed arabesques of geometrical form, adapted, not copied, with great skill and taste from Oriental designs (see fig. 63). Very large plates, wine-coolers, hanging cisterns, and ewers are made of it. One very rare variety has the blue and red pattern on a deep orange ground, but it is very inferior in artistic effect to that on the white ground. The finest specimens were made before 1700; after that time the painting became coarser. Copies of Chinese wares

Potters' marks.

FIG. 63.—Dish of Rouen enamelled pottery, painted in blues and deep red.

were also made at Rouen in the 18th century, all gaudy in colour, and mostly poor in execution. The Rouen Museum has the best collection of its native ware; there are very fine specimens also in the South Kensington Museum. During the 18th century Moustiers produced some very decorative pottery, painted in various shades of blue, with delicate wreaths, masks, and arabesques, somewhat after the Rouen fashion. Other colours were also used in very minute

patterns, but the simple blue and white is the best. Blue and white pottery with fairly good designs was also manufactured at St Cloud, Sceaux, and Saint Amand, as well as many other French towns, during the first half of the 18th century. Most, however, of the French wares of this date are little better than imitations of porcelain, and their decoration feeble copies of Chinese or Japanese designs.

Literature.—For Oiron ware, see Delange, *Recueil de . . . Faïences . . . d'ite de Henri II.*, 1861; Fillon, *Les Faïences d'Oiron*, 1863 (best work); Tainturier, *Les Faïences d'ite de Henri II.*, 1860. For Rouen ware, see Delisle, *Faïence de Rouen*, 1865; Pottier, *Histoire de la Faïence de Rouen*, 1870; Ris-Paquot, *Faïences de Rouen*, 1870. For other French potteries the reader may consult Clement de Ris, *Faïences Françaises, Musée du Louvre*, 1871; Mareschal, *Faïences Anciennes et Modernes*, 1867; Tainturier, *Porcelaine et Faïence (Alsace et Lorraine)*, 1868; Houdoy, *La Céramique Lilloise*, 1869; Davillier, *Faïence de Moustiers*, 1868; De Sézange, *La Faïence de Nevers*, 1863; Pouy, *Les Faïences d'Origine Puarée*, 1874; Fillon, *L'Art de Terre chez les Poitevins*, 1864. The various volumes of the *Gaz. des Beaux-Arts* contain many valuable articles on the whole subject.

SECTION XIII.—MEDIEVAL GERMAN, DUTCH, &c.

Though little is known of the early ceramic history of Germany, it is certain that the application of a tin enamel and enamel colours was known to the potters of that country even in the 13th century. Some plaques, with heads in relief, painted in various colours over a white enamel ground, still exist at Leipsic; they were made for wall-decoration, and are said to be of the year 1207. At Breslau there is a monument of enamelled clay to Henry IV. of Silesia, made about 1300. According to one story, the use of a white tin enamel was perfected at Schelestadt by an Alsatian potter who died in 1283. Other examples exist, though few in number, at various places in Germany, sufficient to show an early acquaintance with the method of producing enamelled ware, which, however, seems to have fallen into disuse, and during the 15th and 16th centuries to have been superseded by the fine sorts of stoneware, in the manufacture of which the German potters were so widely celebrated.

Grey stoneware, richly decorated with delicate stamped patterns in relief, and generally, though not always, covered with a lead glaze, was produced in great quantities in Germany, Flanders, and Holland from the end of the 14th century till quite modern times, and was very largely imported into England and France. Much of this stoneware (called by the French "grès de Flandres") is decorated with great delicacy and taste; its tint, grey, brown, or cream-white, is very soft and agreeable. The earlier specimens have reliefs of a Gothic character, always stamped with great crispness and sharpness, not the least blunted by the process of firing; many have elaborate coats of arms, or branches of simple foliage, which spread gracefully over the surface of the vessel; others have bands of figures, very minutely treated in slight relief. Another method of decoration was by incised patterns, impressed from relief-stamps; sometimes, as was the case with the Oiron ware, bookbinders' dies were used for forming such patterns in the soft clay. Some of the cream-white ware is left unglazed, but most kinds have a vitreous lead glaze, either colourless or mixed with oxide of cobalt or manganese. These two colours, indigo-blue and purple-brown, are often used to pick out the relief-patterns, thus making the design more effective. Owing to the use of old stamps and traditional designs much of this pottery has patterns considerably older than the ware itself, the date being frequently introduced among ornaments which look very much earlier than they really are. Fig. 64 shows a common form of jug, called a "greybeard" from the grotesque head modelled on the neck. The body of the jug is covered with very graceful scroll-work of oak branches in low relief.

Another curious variety of German pottery, consisting chiefly of tankards and jugs, made to imitate enamelled metal-work, was manufactured mostly at Kreussen in Bavaria. The body is of hard red clay, covered with a dark-brown enamel, the designs in slight relief being taken from the Augsburg or Briot style of metal-work,

—strap-work, wreaths, grotesques, or human figures. A favourite design has reliefs of the twelve Apostles, little

FIG. 64.—Stoneware jug or "greybeard"; Flemish ware, early 17th century. (South Kensington Museum.)

more than an inch high, under flat architectural canopies; a strong Gothic feeling in the treatment of such figures occurs on tankards made as late as the end of the 17th century. The coloured decoration of this ware is very brilliant; the minute figures or ornaments are picked out in bright enamel colours—red, green, blue, and yellow—together producing a very striking but thoroughly unceramic effect. A quite plain stoneware, with surface slightly mottled with grey and brown, appears to have been one of the most esteemed varieties during the 16th century, judging from the beauty of the silver rims and lids with which wine-jugs of this kind were usually mounted. The mottling was produced by the brownish glaze running in the kiln into a granular surface, which formed a pleasant texture, something like that on an ostrich's egg. The best qualities were made at Cologne, and largely imported into England under the name of "Cologne" stoneware. A rude kind of sgraffiato ware was also made in Germany and Holland during the 17th and 18th centuries. Coarse red-clay vessels were covered with a slip of white pipeclay, and rude figures, often of saints or kings, were scratched through the white down to the red body. The whole was then glazed with a yellowish lead glaze. Böttger, the first maker of Meissen porcelain, manufactured curious varieties of pottery at the beginning of the 18th century,—especially a ware like red jasper, which was so hard that it was cut and polished by the lapidary's wheel. It is usually marked with No. 18.

Good collections of German pottery are in the museums of Berlin, Dresden, Munich, Löwenberg, Minden, and private collections at Nuremberg; the Kensington Museum has also a number of fine specimens.

Holland. *Holland.*—Holland, especially the town of Delft,¹ produced very large quantities of pottery covered with a fine white enamel. The early specimens date from the end of the 16th century. Much of this ware is very soft and pleasant in tone, and very decorative in effect, especially that in blue and white only. Designs of great variety occur, some copied from Persian or Chinese originals, others with

coats of arms surrounded by graceful borders, formed of medallions and wreaths. A clever arrangement of peacocks' feathers is a common and very effective motive, used especially for plates. Other sorts of very inferior artistic merit have paintings of flowers or human figures, coarsely executed in rather harsh colours—yellow, green, and red—mingled with the more harmonious cobalt blues and manganese purple. Many pieces of Delft ware are marked with maker's initials, as No. 19 or No. 20, probably two members of the Kulick family, of about the middle of the 17th century.

But little pottery of any real artistic value was produced in any Western country during the 18th century, with the exception of the commoner and cheaper sorts of wares, with little or no ornament, which were still made after the old traditions. The fact is that the increasing introduction of Chinese and Japanese wares and the widely-spread manufacture of porcelain in the West gave the death-blow to the production of pottery designed and decorated after simple and natural methods. The enamelled pottery of the 18th century was mostly little better than a bad imitation of porcelain, a material which has a beauty quite its own, and requires forms and methods of decoration very different from those that are suited even to the most finely-enamelled earthenware.

Literature.—See Menard van Hoorebeke, *Revue des Antiquités*, 1867; Weckherlin, *Vases en Grès des XVI^e et XVII^e Siècles*, 1860; Jouvesaux, *Histoire de . . . Bottiger*, 1874.

Scandinavian.

The pottery of Denmark, Norway, and Sweden for the Scandinavian most part resembles that of Germany. Sweden, especially during the 18th century, was very active in the production of enamelled pottery, but little of it possesses any originality either in form or design. Perhaps the best variety is a ware made at Stockholm, covered with bluish white enamel, on which simple patterns are painted in white. The potteries of Marieberg and Rörstrand² also turned out large quantities, painted mostly with very weak designs; some are imitations of Oriental wares, while other kinds are decorated in a realistic French style.

SECTION XIV.—ENGLISH FROM THE 16TH CENTURY.

Little except the commonest sort of domestic pottery was made in England during the 16th century. The grey mottled stoneware described above, which was largely used for sack-jugs and tankards, appears to have been wholly a foreign import, mostly from Cologne. A common item in 16th-century inventories is—"a stone jugge or pott, garnished with silver and double gylded." The silver-mounted lids were often added by English silver-workers, and are frequently very elaborately embossed and chased. It was not till quite the end of the century that certain Dutch potters started in London the making of stoneware. This English-made ware is hardly to be distinguished from that of Cologne or Holland, as it was designed and manufactured in the foreign way. Large globular jugs, stamped in relief with a grotesque bearded face and other ornaments, were one of the favourite forms. Such were called "greybeards" or "bellarmine," from the unpopular cardinal of that name, of whom the bearded face was supposed to be a caricature (see fig. 64 above). Great numbers were made in the Low Countries and copied by the Dutch potters in London. In 1688 two German potters named Elers settled in Staffordshire, and there produced hard stoneware of very fine quality. Their process, however, soon became known to other potters.

The common wares of this time were mainly produced in the Staffordshire potteries; some were decorated in a very rude but effective way by dropping fluid white slip through a quill on to the surface of vessels made of red

¹ See Havard, *Faïence de Delft*, 1878.

² See *Céramiques Suédoises du XVIII^e Siècle*, 1872.

clay. The whole was then covered with a coarse lead glaze, made from powdered lead ore (sulphide of lead), sprinkled through a sieve on to the soft clay. The process of firing produced a vitreous glaze, composed of silicate of lead, the silica being taken up from the clay body. Thomas and Ralph Toft made a number of large plates, drinking mugs or "tygs," and candlesticks, decorated in this way with rather elaborate designs (see fig. 65). The potter's name and the date frequently occur among the slip ornaments, which are sometimes in red and brown on a white ground, as well as white on red. About the year 1680 a new sort of glaze was invented, very useful for the common kinds of hard stoneware, and extremely durable, namely, the "salt

glaze," applied by throwing common

salt (chloride of sodium) into the hot kiln when the process of firing was nearly complete. The salt was volatilized and decomposed; the soda combined with the free silica in the clay, and a coating of hard silicate of soda was formed. A very high temperature is required for this process, which is chiefly used for drain-pipes and vessels to hold corrosive acids, the salt glaze being almost indestructible.

Towards the end of the 17th century a gentleman named John Dwight spent many years in experiments to improve the manufacture of pottery, and also to discover the secret of true transparent porcelain. He appears to have been an artist of great ability, and not only made domestic pottery of Cologne ware but also modelled figures and large busts in pale-grey glazed stoneware; the British Museum possesses a fine portrait bust of Prince Rupert by him, modelled with great truth and spirit, almost recalling the touch of the old Florentine sculptors in terra-cotta. In 1671 John Dwight took out a patent for his special methods of pottery and porcelain work, and set up kilns at Fulham. Many of his receipts for porcelain exist, and have been published in Jewitt's valuable work on *The Ceramic Art of Great Britain* (1877), but no specimens of this early English porcelain are now known.

The Lambeth potteries were established at a very early period, but it was not till the 17th century that they produced ware superior to the common biscuit or lead-glazed varieties. Some pieces of about 1660 are marked with No. 21 mark. Certain Dutch potters settled at Lambeth early in the century, and started the manufacture of a finer sort of pottery, covered with a tin enamel. Most of this is in the Potter's mark. style of the Delft wares, painted either in No. 21. cobalt blues alone or with the coarse green, yellow, and manganese purple used in the more gaudy kind of Delft. The Lambeth potters also imitated Palissy ware, with high reliefs of human figures or plants and reptiles,—very poor copies of Palissy's originals, the modelling being extremely blunt. The enamel ground has a pink tinge, and the reliefs are picked out in various colours. Some specimens of this Lambeth ware are dated on the back in blue with various years during the reigns of Charles I. and Charles II. Another variety has coarse imitations of late Italian majolica, while other pieces have English designs,—coarse

FIG. 65.—Coarse earthenware dish, with decoration in slip, signed by Thomas Toft, c. 1670. (Museum of Geology, London.)

portraits of Charles II. and his queen, with arabesque borders, all very rudely executed.

The beginning of the 18th century in England saw a great increase of activity in the production of many kinds of pottery. Numbers of patents were taken out and new kilns set up at a great many different places. Though many improvements were made in the preparation and combination of different clays and considerable advances in technical skill were gained, yet little pottery of any artistic value was made.

Wedgwood Ware.—The Wedgwoods were an old Staffordshire family, and one member at least was a potter in the 17th century. This was John Wedgwood (1654-1705), the great-uncle of Josiah, who in the next century founded the great pottery which he called "Etruria." Only one piece signed by John Wedgwood is known to exist; it is in the interesting historical collection of ceramic wares in the Jermyn Street Museum of Geology, London. It is a "puzzle jug" with three spouts and a hollow handle, made of coarse brown clay, covered with the usual green lead glaze. The potter's name and the date 1691 are incised round the jug.¹

In the middle of the 18th century, when Josiah Wedgwood was a young man, a great impulse had been given to the study and appreciation of classical art, partly through the discovery of the buried cities of Pompeii and Herculaneum, and also on account of the growing enthusiasm for the beautiful Greek painted vases, which were then being sought for with great avidity in the tombs of Etruria and Magna Græcia. Josiah Wedgwood devoted his life and great talents to an attempt to reproduce the severe beauties of the Greek and Roman pottery. Unfortunately in this not unpraiseworthy aim he neglected the special requirements of fictile work. His productions, delicate and beautiful as they often are, have the characteristics of anything rather than pottery. With great labour and expense he turned out from his workshops imitations, necessarily unsuccessful, of ancient engraved gems and camei, of jasper, basalt, or mottled marbles, of gem-like cut glass, such as the Portland vase, and dull copies, feeble in drawing and hard in texture, of beautiful painted Greek vases. Of natural methods of decoration suitable to pottery, or of the life and freedom of the plastic clay rising into graceful forms under the touch of the thrower's hand aided by the rhythmical movement of the wheel, he knew nothing. Nearly all his pottery is dully scholastic and archaeological in style, and therefore must, on the whole, be regarded as a failure, though often a very clever and even beautiful failure.

Wedgwood's most characteristic ware, in the production of which he was aided by Flaxman and other able artists, consists of plaques and vessels, vases, cups, plates, and other forms moulded in clay, delicately tinted blue, brown, and various colours, on which minute cameo reliefs in white paste were applied while they were soft, and were then fixed by firing. Many of them have very beautiful figures, some copied from Greek and Roman gems or vases, others being specially designed for him; but all are classical in style. Some of his pieces are quite astonishing for their microscopic delicacy of detail; others have wreaths, foliage, and minute diaper ornaments applied in the same way. Wedgwood also produced very fine and porcelain-like varieties of white enamelled pottery, some even decorated with a metallic lustre, purple in colour, and mottled to imitate marble; some are cleverly modelled to imitate large sea-shells. Indeed his technical methods were varied with the utmost ingenuity, and would need a treatise to themselves if even a rough outline were given of all the varieties.

¹ For a full account of the Wedgwood family and their ware, see Jewitt, *Life of Josiah Wedgwood*, 1865; and Meteyard, *Wedgwood and his Works*, 1873.

Towards the end of the 18th century many imitations were made of the Wedgwood cameo ware by different English manufacturers, and even at Sèvres it was copied in porcelain, though with original French designs. None, however, are equal to Wedgwood's work, either in beauty of design or delicacy of execution.

Modern
work.

Until quite recently little or no pottery of any artistic merit has been produced in England during the present century, partly owing to the absurd notion that pottery is a sort of inferior porcelain, and should be made to resemble it as much as possible, and also very largely on account of the invention in the 18th century of a process (described below) for *printing* patterns under the glaze, so as to avoid the labour of painting them by hand. Other modern so-called improvements of manufacture have done much to destroy all true art in English pottery; such are the too finely ground and artificial mixtures of different materials, the great use of the mould in preference to the potter's wheel, and, most fatal of all, the fact that, when the pottery is thrown on the wheel, it is afterwards handed over to a workman who turns it on a lathe and rubs it down with glass-paper, as if it were a block of wood, thus removing all the surface put on the vessel by the touch of the thrower's hand. Indeed, the great manufactory of Sèvres has now so completely lost all sense of the natural and reasonable treatment of plastic clay that the larger vases are *cast* whole by being poured in a fluid state into a mould, a method reasonable enough for iron or bronze but ludicrously inappropriate to plastic clay. Some few manufacturers have, however, of late tried to produce pottery shaped and decorated in a more natural way. The Lambeth pottery produces a good deal of excellent work, especially ware covered (after the Japanese fashion) with one brilliant enamel colour. Mr William De Morgan of Chelsea and Merton has perhaps made the greatest advances of all, having rediscovered the way to make and use the beautiful thickly-glazed blues and greens of the old Persian ware, and also the fine silver and copper lustres of Gubbio and Spain. He uses these splendid colours in designs conceived and drawn with the old spirit, but of sufficient originality to make them a real stage in the development of ceramic art, not a mere archaeological revival of styles and methods which have long ceased to have a significance and life of their own.

Sad though the confession is, it must be admitted that, to find a class of pottery designed with lines of natural beauty and produced in accordance with the simple requirements of plastic clay, it is, for the most part, necessary to go, not to the centres of our boasted 19th-century civilization with its countless devices for turning out work cheaply and rapidly, but rather to the humble workshops of more primitive races, among whom the commercial spirit has not yet destroyed all inborn feeling for true art and beauty.

Literature.—For English pottery, see Jewitt, *Ceramic Art of Great Britain*, 1877; Solon, *Old English Potter*, 1889; Owen, *Ceramic Art in Bristol*, 1878; Wallis and Bannister, *Pottery of Derbyshire*, 1870; Mayer, *Art of Pottery in Liverpool*, 1855; Blinn, *Pottery in Worcester from 1751 to 1851*, 1895; Church, *Catalogue of English Pottery*, 1870; some of these works deal more with porcelain than pottery.

SECTION XV.—ANCIENT MEXICAN, PERUVIAN, &c.

Mexico
and
Peru.

The pottery of ancient Mexico and Peru, certainly older than the Spanish conquests in America, and possibly dating from a much more remote age, has many points of interest. Large quantities in good preservation have been discovered in the tombs of chiefs and other important persons of those once powerful and (in a somewhat barbaric way) artistic races. Much of their pottery is grotesque and even hideous in shape, modelled in the forms of semi-human monsters; it is often made of a hard black clay, well burned, something like the early black wares of Etruria. Another kind is graceful and natural in shape, formed with great taste and skill on the potter's wheel. Many of the forms seem to have been suggested by vessels made of gourds. The decoration is very curious; many of the simple painted patterns with geometrical designs and hatched lines call to mind the earliest type of painted decoration on the archaic pottery of Mycenæ and the Greek islands. The clay is fine in texture and has a slight surface-gloss, apparently the re-

FIG. 66.—Ancient Peruvian vessel. (British Museum.)

sult of mechanical polishing. Fig. 66 shows a typical form.¹ The British Museum has a good collection of this ware. The natives of Arizona and other uncivilized races of America even now make simple pottery decorated with taste and true decorative feeling.

SECTION XVI.—POTTERY AND PORCELAIN OF CHINA AND JAPAN.

In the methods of treatment employed in China and Japan the usual distinctions between pottery (earthenware) and porcelain (kaolinic ware) are not always observed. In many cases these two different materials are treated in exactly the same way and decorated after the same fashion. It will therefore be convenient to describe them both together.

History of Chinese Porcelain.—The chronological arrangement of Chinese wares is a matter of great difficulty. Many of the professedly historical records of the Chinese themselves are quite untrustworthy; as with all other arts, they have claimed for the manufacture of porcelain an antiquity far beyond the actual facts of the case. This exaggerated estimate of the antiquity of Chinese porcelain was for a long time supported by the supposed discovery in Egypt of certain small bottles made of real porcelain, and inscribed with Chinese characters, which were said to have been found in tombs at Thebes dating as early as 1800 B.C. The fact, however, that they are inscribed with quotations from Chinese poets of the 8th century A.D., and have characters of a comparatively modern form, shows that the whole story of their discovery is a fraud. The only native work which gives trustworthy information on the development of Chinese porcelain is a *History of the Manufacture of King-te-chin*, compiled from earlier records in 1815 by a native official, which was translated into French by M. Julien, under the title *Histoire de la Fabrication de la Porcelaine Chinoise* (Paris, 1856). According to this work, the manufacture of pottery is said to have commenced in 2697 B.C., and that of porcelain during the Han dynasty, 206 B.C. to 25 A.D. The Tsin dynasty (265-419 A.D.) was remarkable for its blue porcelain, and the Suy dynasty (581-618 A.D.) for its fine green ware. One of the most celebrated kinds of porcelain was that made about 954 A.D., deep sky-blue in colour, very glossy in texture, extremely thin, and sounding musically when struck. Even small fragments of it are treasured up by the Chinese, and set like jewels. Most dynasties seem to have been famed for a special variety of porcelain. The earlier sorts appear not to have been decorated with painting, but were all of one rich colour. Decorative painting did not apparently come into general use before the Yuen dynasty of Mongols (1260-1368), and was brought to great perfection under the Mings (1368-1644). The porcelain of the last-named dynasty is classified in periods, four of which (from 1426 to 1567) were greatly esteemed. Probably few specimens of Chinese porcelain known in Europe are earlier in date than the time of Kang-he, the second emperor of the Tsing dynasty (1661-1722). During all periods Chinese potters were constantly in the habit of copying earlier styles and of forging their marks, so that very little reliance can be placed on internal evidence. Indeed, the forgeries often deceive the Chinese collectors of old porcelain.

Manufacture of Porcelain.—It is made from two substances, "pe-tun-tse" and "kao-lin"; the latter is a white pasty substance derived from the decomposition of felspathic rocks such as granite. It is a hydrated silicate of alumina ($\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 + 2\text{H}_2\text{O}$), and derives its name from a hill near King-tih-chin, where it was first found (see KAOLIN). The precise nature of pe-tun-tse is not

¹ See Rivero and Von Tschudi, *Antigüedades Peruanas*, 1851.

exactly known, but it appears to resemble kaolin, with the addition of a considerable proportion of free silica. The result of their mixture is shown in the following analysis by M. Laurent of the body of white Chinese porcelain—silica 70·5 per cent., alumina 20·7, potash 6, lime 0·5, protoxide of iron 0·8 per cent., magnesia a trace. The white pastes of which the porcelain is made are very carefully washed, finely ground, and mixed in due proportion. The paste is “thrown” on the potter’s wheel in the usual way and set to dry; its coloured decoration is then applied, and over that the transparent glaze is laid. This is a very hard and beautiful substance, which requires great heat to fuse it; it is made of almost pure felspar with an alkaline flux. It is finely ground with water, and either blown with a pipe on to the vessel or the vessel is dipped into it. The porcelain is next packed in clay boxes or “saggers,” piled one above another in the kiln, in order to protect it from discoloration from the smoke. After the kiln has been heated for a considerable time to a very high temperature, the fire is withdrawn; and the porcelain is allowed to cool slowly in the clay saggers before the kiln is opened and its contents removed. Additional decoration is frequently added over the glaze, generally in enamel colours, applied thickly so as to stand out in perceptible relief; gilding is also added over the glaze. The porcelain is afterwards fired a second time in a more open kiln, and at a lower temperature.

Decora-
tion.

The methods of decoration on Chinese porcelain are extremely varied, and are applied with the most skilful hand and wonderful fertility of design; but they are always dainty and feebly pretty rather than artistic, except when there is a Persian element present. The Chinaman is a born maker of graceful toys, full of ingenuity and perfect deftness of touch, but hardly worthy to be classed as a producer of serious works of art. The general forms of the porcelain are mostly feeble, and often of extreme ugliness, while the skill in drawing is mostly confined to representations of flowers, some of which, especially the chrysanthemum and the pæony, are painted with great truth and enjoyment. With the beauties of the human form the Chinaman has no acquaintance or sympathy, and he never possessed the wonderful skill of the Japanese in the delineation of animals and birds.

Only a few chief examples among the many methods of decorative treatment can be mentioned here. A useful classification has been adopted by Mr A. W. Franks in his valuable catalogue of his own collection of porcelain, formerly exhibited at Bethnal Green, and now (1885) in the British Museum.

Plain
white.

1. *Plain white*, of a delicate ivory colour and a rich satin-like glaze. Some of it is *crackled*, not accidentally, but by a careful process, one of the methods of which is this. Powdered steatite is mixed with the materials of the felspathic glaze, and the porcelain vessel or statuette, after the glaze is applied, but before firing, is set in the rays of a hot sun, which causes it to be covered with a network of fine cracks, going through the skin of glaze down to the porcelain body. Red pigment or black Chinese ink is then rubbed into the minute cracks, which are thus made more conspicuous, and prevented from quite closing up in the heat of the kiln. Many specimens have two sets of crackle, first the coloured cracks produced before firing, and secondly an intermediate uncoloured set, produced in the glaze by the action of the kiln (see fig. 67). Most of this white ware is decorated with delicate surface-reliefs of flowers or figures very sharply moulded. Old specimens of it are now highly valued in China. It was frequently copied in the early European porcelain manufactories, such as Saint-Cloud, Meissen, and Chelsea.

One
enamel
colour.

2. *Porcelain covered with one Enamel Colour*.—Enamels of many varieties of tint and great brilliance were used: the finest are blue, from copper or cobalt; deep red, another oxide of copper; yellow, antimoniate of

FIG. 67.—Chinese cup with crackle glaze.

lead; and black, oxides of iron and manganese. One of the most beautiful is that sea-green tint called “celadon,” which was early exported into England, and highly valued in mediæval times from its supposed property of changing colour at the contact of poison. New College, Oxford, possesses a bowl of this ware, mounted in silver richly worked, of about 1500 A.D., and presented to the college by Archbishop Warham early in the 16th century. A specimen of this celadon ware is probably referred to among the list of new-year’s gifts to Queen Elizabeth as “a cup of grene pурсselyne” given by Robert Cecil. The fine old yellow porcelain was only made for the use of the emperor of China, and it is consequently rare; it is very thin and transparent, almost like a vitreous enamel. Some of the Chinese enamelled wares are made of pottery, not of porcelain; earthenware, in many cases, was equally good for the purpose, as the body of the vessel was hidden by the coloured enamel.

3. *Porcelain decorated with several Enamels or Glazes of different Colours*.—This ware is frequently moulded in relief, with dragons, flowers, or various animals, picked out in different colours, often very harsh and gaudy in effect. Fig. 68 shows a pilgrim-bottle painted in enamel colours. The beauty both of form and of decoration for which this piece is very remarkable is mainly due to Persian influence.

4. *Porcelain painted in White Enamel over a Ground of Coloured Enamel*.—This is a very decorative sort of ware; the designs, such as flowers, birds, and insects, are applied thickly in the white pigment, and are sometimes carefully modelled in low relief. The method was largely imitated by the Persians (see p. 620 above).

FIG. 68.—Chinese pilgrim-flask, painted with enamel colours; Persian style.

Several
enamels
and
colours.

White on
coloured
enamel.

5. *Porcelain painted only in Blue*.—This is really the most artistic and highly decorative of all the varieties of Chinese painted wares. Some of the large plates and jars have very good designs, treated in a not too realistic manner. Much of the finest porcelain of this class both in form and decoration shows a strong Persian influence, the result of the intercourse between China and Persia and the visit of Chinese potters to Ispahan mentioned above in the account of Persian pottery. Nanking porcelain, painted with the so-called “hawthorn pattern,” really a kind of *Prunus* which produces its blossoms before its leaves, was largely imported into England during the last century, and now fetches very exorbitant prices. Unluckily during the 18th century a great deal of the fine blue and white china brought into England was painted over the glaze with harsh gaudy colours in English and French porcelain manufactories, to please the degraded taste of the time, and was thus completely spoiled. Other combinations of Chinese and European work occur. Sets of porcelain were painted in China with French or English designs to suit the European market; or plain white porcelain was sent from China to be decorated at Chelsea or Bow. Very ludicrous results were produced in some cases by this mixture of style; engravings were sent from Europe to be copied on porcelain by the Chinese potters, who have in many cases laboriously painted an exact facsimile of the copper-plate lines with all their hatchings and scratchy look. Some of these were done for Jesuit missionaries in China, and Chinese plates with Catholic sacred subjects and figures of saints exist in considerable quantities. Statuettes of the Madonna were also made in China for the missionaries, carefully modelled in white porcelain after European originals; some appear to be copies from 14th-century French ivory figures, and (even in the hands of the Chinese potter) have preserved a strong resemblance to their mediæval original. The type of the Holy Mother thus introduced appears to have been adopted by the Chinese Buddhists as a fitting representation of their goddess Kwan-lin, many figures of whom were made with but little alteration from the statuettes of the Catholic Madonna.¹

6. *Porcelain painted in many Colours under the Glaze*.—This Poly-coloured class includes all varieties of form and decoration. The chrome colours are often harsh and inharmonious, and the more elaborate under figure-subjects are nearly always grotesque and ugly. Additional glaze.

¹ See Watkins Old, *Indo-European Porcelain* (Hereford, 1882).

richness of effect is often given by the over-glaze colours, added by a second firing. Many other varieties might be mentioned, but the student must be referred for further information to the list of works on this subject given below.

Both pottery and porcelain have been used on a large scale for architectural purposes in China. The so-called "porcelain tower" of Nanking was the most prominent example. It was a very elaborate structure (see NANKING), mostly constructed of pottery covered with enamels of different colours. The usual name is misleading, as only the white portions were of real porcelain. The Jermyn Street and British Museums have specimens of its bricks and elaborate architectural features.

Japanese Pottery and Porcelain.—In the main the technical methods used in Japan and the styles of painted ornament were introduced from China, and also to a less extent from the adjacent peninsula of Corea. Glazed pottery was first made at Seto about 1230 A.D. by a potter who had visited China. Porcelain manufacture was introduced in a similar way into the province of Hizen about 1513. On the whole the Japanese are more remarkable for their skill and almost endless methods in the production of pottery than of porcelain. No people ever approached them for marvellous fertility of invention and skill in the manipulation of all sorts of clay, pastes, enamels, and pigments. One of the most remarkable characteristics of Japanese pottery is its wonderful success in the imitation of all kinds of materials and texture of surface, one great object apparently being to make it resemble anything rather than what it really is. Wood, with its varying colours and delicate grain, ivory, bronze, lac, marble, basket-work, fruits, and countless other substances are imitated in Japanese pottery with the most perfectly deceptive effects. The utmost amount of labour and patience is often spent with this one object, any notions of real artistic beauty being apparently never even considered.

A great deal of Japanese ceramic ware is simply copied from Chinese porcelain, and often has forged Chinese marks. It is very difficult to find out what notions the Japanese themselves really have as to what is admirable in pottery. A purely archaeological interest in old sorts of ware appears to affect them strongly, and they often put the highest value on what appears a very ordinary and rudely-made kind of pottery. As Mr A. W. Franks has pointed out in his introduction to a native report on Japanese pottery, published by the Science and Art Department, 1880, the high value which they put on rude specimens of glazed pottery is partly kept up by the existence of certain curious old tea-drinking ceremonies, solemnly performed as if they were religious rites. Everything used and every detail of the performance were strictly prescribed by rule. The bowl or cup out of which the tea was drunk by the guests was to be an archaeological curiosity remarkable for its age, not for any intrinsic merit. Some of these cups which have been brought to Europe are of coarse clay, ill-formed, thick, highly glazed, and quite without ornament. One in the Sèvres Museum, said to be Seto ware of the 14th century, is made of mottled yellowish brown clay, with a thick vitreous glaze. It looks quite worthless, but has evidently been highly valued by its Japanese owner, for it has a beautifully made ivory lid, and is protected by three cases,—first, fine white silk with gold cord; second, a box of polished bamboo; and, outside of all, a case of figured linen lined with silk. Others of these precious tea-bowls are red, purple, black, or grey, all very thick and coarse, but highly glazed, and carefully fitted into silk cases.

Some of the Japanese methods for the decoration of pottery are simple and effective; especially a ware made of grey clay with incised patterns—birds, flowers, and the like—filled in with white paste, and the whole glazed,—similar in method to the 16th-century Oiron ware.

The most magnificent sort of pottery is the Satsuma ware, originally introduced from Corea. It was at first

manufactured in a private factory belonging to the prince of Satsuma, but afterwards produced for public sale. The most highly-decorated kinds with many colours were not made till the end of the 18th century. In minute richness it is probably the most elaborate ware ever produced. The body is a fine ivory-white clay, covered with a minutely crackled glaze. Over this, miniature-like paintings of human figures or flowers are executed in brilliant enamel colours, some of which stand out like jewelled reliefs. It is further decorated with delicately moulded patterns in gold, and, though very weak in real decorative effect, is a marvel of rich workmanship. Most of the so-called Satsuma now sold is a poor imitation of the ware, and is made in great quantities at Awata and Ōta.

It should be observed that nearly all the very elaborate and magnificent methods of ceramic decoration now so much employed by the Japanese are of quite modern origin; before the present century the simpler methods of China were almost exclusively followed in Japan. During the last century great quantities of porcelain, chiefly decorated in gold, green, and a rich red, were made expressly for export, and largely brought into Europe, where they were frequently copied, especially in the porcelain works of Dresden and the early china manufactories of England.

The Japanese have little or no sense of the best kind of decorative art; their paintings of flowers or birds, beautiful as they are, are mostly, as it were, flung across the vessel they are meant to ornament without any regard to its shape or the space to be occupied. Like the Chinese, they have no feeling for the beauty of the human form, or even of some of the nobler animals, such as the horse. The figures most frequently represented on their ceramic wares—the seven gods of good fortune—are all grotesquely hideous; and downright ugliness of the most repulsive sort is often selected and treated with wonderful ingenuity. Many of the paintings have a symbolical meaning; emblems of longevity (considered by the Japanese the chief of all blessings) are perhaps the favourite, such as the sacred tortoise, the crane, or the combination of three trees—the fir, the plum, and the bamboo—all of which have this special meaning.

Within the present century a new and elaborate method of decorating porcelain has been practised in Japan, the chief object of which seems to be to make a porcelain vessel look like a metal one. Brass cloisonné enamel is applied to the outer surface of porcelain vases or bowls; the strips of brass set on edge which form the outline of the design, instead of being soldered to a metal plate, are fixed in some almost incomprehensible fashion to the surface of the porcelain, and then the compartments are filled in with coloured enamels and fired in the usual way,—a marvel of technical skill and wasted ingenuity.

Collections of Chinese and Japanese Porcelain.—The Dresden Collection is the most important historically, having been formed chiefly between 1694 and 1705. The British Museum is rich through the recent munificence of Mr A. W. Franks, who has presented to it the whole of his fine collection. The South Kensington Museum and the museums at Leyden, The Hague, and Sèvres are rich in these wares, as are also those at Vienna, Berlin, and St. Petersburg.

Literature.—For Chinese and Japanese porcelain, see Jacquemart and Le Blant, *Histoire de la Porcelaine*, 1861-62; Jacquemart, *Histoire de la Céramique*, 1878; Audsley and Bowes, *Keramic Art of Japan*, 1875-80; Du Sertel, *La Porcelaine de Chine*, 1881; Graesse, *Catalog der k. Porzellan- und Gefäss-Sammlung zu Dresden*, 1878; Stanislas Julien, *Histoire de la Porcelaine de Chine*, 1856; Franks, *Cat. of Coll. of Oriental Porcelain*, 1878, and "Japanese Pottery," in *South Kensington Museum Handbook*, 1880.

SECTION XVII.—PORCELAIN IN EUROPE.

Early Development.

In various places in Europe, especially in Italy and France, attempts to produce translucent porcelain like that produced by the Chinese were almost continually being made from the end of the 15th century down to the

Japanese
pottery.

Satsuma
ware.

beginning of the 18th. The word "porcelain" is usually derived from the Italian "porcellana," a white shell, to the smooth polished surface of which the Chinese wares bear some resemblance. Hence it should be observed that in mediæval inventories "a cup of porcelain" often means one made of shell or mother-of-pearl. In Italy the finer sorts of majolica were often called "porcellana," and a plate decorated "alla porcellana" meant one with a special style of painting, and did not refer to its material. During mediæval times, when real Eastern porcelain is meant, some other word expressing where it came from was frequently added, e.g., in French 15th-century inventories "porcelaine de Sinant" is sometimes mentioned. From the 13th to the 15th century Chinese porcelain was very sparingly brought into Europe, and generally occurs among royal possessions or gifts as an object of great value. The name "china," from the country where porcelain was made, was given to it not later than the 16th century, and perhaps earlier, having been used by the Arabs long before: "china dishes" are mentioned by Shakespeare (*Measure for Measure*, act ii, scene i.) as being things of value.

Early
Venetian
porcelain.

The main reason of the very slight success gained for so many years in the attempts to make porcelain in Europe was the fact that it was regarded as a highly artificial substance, something between pottery and glass; the many beds of kaolinic clays which exist in Europe were never thought of as being the true material of which to make it, or, if used at all, were only employed partially and in an accidental way. The earliest attempts at the production of translucent porcelain which had any practical success took place at Venice about 1470.¹ An alchemist named Antuonio succeeded in making and firing in a kiln at San Simone, near Venice, "porcelane trasparenti e vaghissime," described, in a document dated 1470, as being as beautiful in glaze and colour as "the porcelain from barbarous countries." Difficulties, however, seem to have arisen, and the manufacture was not proceeded with till 1504, when a few sample specimens were made in Venice, and others again in a spasmodic way in 1518 and 1519. No specimens of the early Venetian porcelain are now known, nor any pieces of the porcelain made at Ferrara for Duke Alphonso II. about 1565-67 by Giulio da Urbino, and mentioned with high praise by Vasari.² The composition of this earliest European porcelain is not known, but it probably was partly made of the white clay of Vicenza—a true kaolinic paste—often used by the majolica potters to give whiteness and fine grain to their clay.

Medici
porcelain.

Medici Porcelain.—The earliest manufactory of porcelain of which known specimens exist is that started in Florence, for Francesco I. de' Medici, about the years 1575-80 by Bernardo Buontalenti (see Vasari). Francesco de' Medici took the greatest interest in the manufacture, and, as is recorded by Galluzzi (*Istoria di Toscana*, 1781), moulded some of the vessels with his own hands, as complimentary presents to other princes. According to Galluzzi, Buontalenti did little more than improve on the method invented a few years earlier by the majolica potters Camillo da Urbino and Orazio Fontana, assisted by a Greek who had learned the secret of true porcelain in China. The discovery of the existing specimens of Medici porcelain is due to Alessandro Foresi, who observed its peculiar texture and, in some cases, slight transparency, and found pieces marked at the back in a way that quite confirmed his theory.³ These marks are the Medici arms, with its "palle" or balls, inscribed with "F. M. M. E. D. II." for "Franciscus Medici Magnus Etruriæ Dux

II." Some pieces have a rude representation of the great dome of the Florentine cathedral, and the letter "F." for "Florentia" (see No. 22). Scarcely forty specimens of the ware are known, which are mostly in the possession of the Rothschilds and Mr Drury Fortnum, in the royal collection at Lisbon, and the museums of South Kensington and Sèvres. They are all of a slightly creamy white, with a beautiful pearly texture, due to the rich glaze and the slight transparency of their paste; the glaze varies in thickness, and in some instances is slightly cracked. Nearly all are simply decorated in cobalt blue, under the glaze; the designs are of various styles, some purely Italian, others Persian or Chinese in character; a few have one flower painted in the middle of the space in a graceful and almost realistic way. A plate at Lisbon has a figure of St John with his eagle. Their forms are pilgrim-flasks, plates, ewers, and vases of different shapes, some very graceful and original.

F.

Potter's mark.
No. 22.

The earliest dated example is among the five specimens in the Sèvres Museum; it is a square bottle with the arms of Spain painted in blue and a few touches of manganese purple; the date 1581 is introduced among the ornaments at a corner of the bottle; it was probably a gift from Francesco I. to the king of Spain. The composition of this porcelain has recently been discovered from a contemporary MS. in the Magliabecchian Library at Florence. The paste consisted of 24 parts of white sand, 16 of a crystalline frit (powdered rock-crystal 10, and soda 8), and Faenza white earth 12 parts. To 12 parts of this mixture 3 of the kaolinic clay of Vicenza were to be added. Probably to secure greater whiteness, the vessels were covered, under the glaze, with a white enamel; but this addition appears needless. They were then glazed with an ordinary silicious lead glaze. Though the final result has the beauty and some of the special qualities of the Chinese natural porcelain, yet it will be observed that this end was gained in a very difficult and elaborate manner, which must have been very costly. This, no doubt, is the reason why so few pieces were made, and why its manufacture ceased altogether with the death of Francesco de' Medici, in 1587.

After the Medici ware ceased to be made there is a blank French of nearly a century in the history of European porcelain. In 1664 a patent was granted to Claude Reverend, a citizen of Paris, which gave him the privilege of making "imitation porcelain, as fine as that from the East Indies."

No known specimens can be attributed with certainty to his workshop, though some pieces which bear mark No. 23 may have come from his hands. In 1673 another patent was conceded to Louis Poterat, who certainly did produce artificial porcelain at Rouen. Some small pieces, salt-cellars and mustard-pots, in the museums of Rouen No. 23. No. 24. and Sèvres, are attributed to him, and are therefore the earliest undoubted examples of French porcelain. They are of a pearly white colour, with rich glaze, not unlike the Medici porcelain in softness of texture. The ornaments, simple and delicate arabesques, are painted under the glaze in cobalt blue only. Some pieces are signed with No. 24.

Potters' marks.

Saint Cloud was the next place in France where porcelain was produced, the manufactory being carried on by the Chicanneau family, to whom a privilege was granted in 1695. The patent mentions that they had made porcelain since 1693. This early Saint-Cloud porcelain is fine in texture and glaze, and is decorated in many different styles: it is pure white, moulded with slight reliefs copied from the

Chinese; or painted in many bright colours and gold with Chinese designs; or thirdly, with paintings in blues only of flowery scroll-work and grotesques. It is marked either with a sun, or with "S. C." combined with "T." (see No. 25), and other makers' initials. Martin Lister, physician to Queen Anne, in an account of his travels in France during 1698, mentions a visit which he paid to the Saint-Cloud porcelain works, and speaks with great admiration of their productions. The privilege was frequently renewed during the first half of the 18th century, and the Saint-Cloud manufactory continued to be the most important in France till the establishment of the royal manufactory at Sèvres.

Other places in France during this period, from 1700 to 1745, produced a certain quantity of artificial porcelain. These were Lille, from 1711, marked with No. 26; Paris, 1722, a branch of the Saint-Cloud works; and Chantilly, from 1725. The porcelain of Chantilly was specially intended to imitate old Japanese ware. Like the

Medici porcelain, it has a white tin enamel over the paste. It is marked with a hunting-horn (see No. 27) and painter's initials. Porcelain of every variety of style was also made at Menecy-Villeroy from 1735, under the patronage of the duke of Villeroy, with whose initials, "D.V.," all the productions of the manufactory are marked. All these early varieties of porcelain were of the artificial or soft kind, called by the French "porcelaine à pâte tendre."

Sèvres.

The increasing success and popularity of the porcelain produced in Germany and England induced Louis XV. to establish a private royal manufactory of porcelain, which was first started at Vincennes, with a privilege granted to Charles Adam and others in 1745. In 1753 the king himself became a partner in the works, with a third share in the property. The seat of the manufactory was then transferred to Sèvres, and the official title was assumed of "manufacture royale de porcelaine de France." Before 1753 the royal porcelain was simply marked with two crossed L's for Louis, but from that year a date-letter was made compulsory,—A for 1753 (see No. 28), B for 1754, and so on till 1777, after which a new doubled alphabet was started AA (see No. 29), BB, &c.; this lasted down to RR (1793), and then a less regular series of marks came into use. Till 1792 the date-letter was put between the crossed L's, but in that year the republic substituted the letter R. Later various royal monograms and marks were used.

Till about 1770 all French porcelain was artificial or "soft" (*pâte tendre*); the discovery of kaolinic clays in France then brought about the manufacture of natural hard porcelain (*pâte dure*) like that made in China and Japan. This gradually superseded the soft kind, which ceased to be made at the end of the 18th century. Its manufacture has recently been revived at Sèvres to some slight extent. M. Brongniart, the director of the Sèvres porcelain works from 1800 to 1847, in his most valuable *Traité des Arts Céramiques* (1854), gives a full account of the materials and methods used at Sèvres during all periods. The soft porcelain was composed of white sand 60 per cent., nitre 22, common salt 7.2, alum 3.6, soda 3.6, and

gypsum 3.6 per cent. This compound was roasted at a high temperature, then ground to a fine powder, and washed with boiling water. To nine parts of this mixture or frit two parts of white chalk and one of a sort of pipe-clay were added. The whole was again ground, and passed several times through a fine silk sieve. Water was added to make the powder into a paste, and it was then fit for the thrower on the wheel or the moulder. Owing to the very unplastic nature of this elaborate mixture, black soap and size or glue made from parchment were added to bind the paste together under the moulder's hands. The glaze used for the *pâte tendre* was an ordinary silico-alkaline glass, made fusible by oxide of lead. The coloured decorations and gilding were added after the firing of the glaze. The hard porcelain is made of natural kaolinic clays, and is glazed with almost pure felspar,—both substances very hard and infusible. The superior softness and richness of effect possessed by the *pâte tendre* are due to the fact that the paintings on the softer and more fusible glaze sink slightly into it under the heat of the kiln, and are, though almost imperceptibly, blended one with another. It is easy to distinguish the two pastes and glazes: pieces of the one kind can be scratched by a knife, while those of the other resist it. Nevertheless the difference in beauty between the two kinds of porcelain has been much exaggerated, and the extravagant prices which are given for the *pâte tendre* are greatly due to its rarity, and to its having been produced earlier than the other. The whole question, in fact, of the value of Sèvres porcelain is a highly artificial and conventional one, which can hardly be considered in accordance with the ordinary rules or canons of art. Certain special qualities were aimed at, such as brilliant colours, with absolute smoothness of surface, microscopic delicacy of painting, and the most perfect accuracy and neatness of execution throughout; and it must be admitted that the porcelain-makers gained their object with the help of ingenuity, technical skill, and unwearied patience, which must command our respect and even admiration, whatever may be our verdict as to the artistic result of their labours. Still, with all possible allowances, there is no doubt that rarity, the necessary result of the slow and laborious processes employed, is the chief reason for the extraordinary value now set on this porcelain.

The £10,000 which three flower-vases of *pâte tendre* fetched at a public auction a few years ago can be accounted for on no other hypothesis. The colours of Sèvres porcelain are generally harsh, and out of harmony with the pictures they surround; the forms of the various vessels too are frequently very ungraceful, and utterly unsuited to any plastic substance.

The whole of this porcelain ware, in fact, labours under the serious artistic disadvantage of being designed and decorated with no regard to suitability of material or method; the elaborate picture-subjects would have been far more fit for ivory miniature-work, and are quite without breadth of decorative effect, while the shapes of the more elaborate vases are often deliberate imitations of gold and "or moulu," which in no way suggest the special pro-

perties of a fictile material (see fig. 69). It is difficult to realize the amount of thought and labour that was spent on the production of Sèvres porcelain. The chief chemists of France devoted their energies to the invention of brilliant and varied pigments which would stand the severe test of the kiln. The works of the best painters were used for reproduction among the painted decorations of the porcelain, and many artists of real talent spent their lives in painting these gaudy toys—on the whole a sad waste of labour and skill.

Decora-
tion.

Sèvres porcelain made for actual use, such as tea-sets and dessert-services, are usually painted with flowers or figure-subjects, often in many tints, and enriched with gilding, but on a plain white ground. It is the purely decorative pieces, such as vases and flower-vessels, that are ornamented with the greatest splendour. They generally have panels with pictures on a white ground surrounded by frames of gold scroll-work; the main body of the piece is covered with one deep or brilliant colour. The chief colours are *gros bleu*, a very dark blue; *bleu du roi*, a deep ultramarine; a brilliant turquoise blue; a bright pink, the favourite colour of Madame Pompadour, but generally called "rose Du Barry"; a bright yellow, a violet, and three shades of green were also used. These brilliant colours are often further decorated with gold; a ground with circular groups of gold spots scattered over it is called "œil de perdrix"; other kinds of diaper were also used. The most gorgeous variety of all is the *jewelled Sèvres*, not made till about 1780, and generally having a ground of *bleu du roi* or ultramarine. It is richly set with imitation jewels, chiefly turquoises, pearls, and transparent rubies, made of coloured enamel pastes, hardly to be distinguished in effect from real stones. They are set in gold, slightly modelled in actual relief, like the gilt ornaments on the richest sort of Japanese Satsuma ware.

Forms.

The forms of Sèvres porcelain are very varied, and, in spite of the great use of plaster moulds, many reproductions of the same design were rarely produced. Clocks, barometers, and various other objects were made of porcelain and richly decorated, and also painted panels or plaques used for furniture,—always, however, with most discordant effect. Beautifully modelled statuettes in white biscuit porcelain were made by some of the ablest sculptors of the 18th century; these usually have pedestals elaborately gilt and painted. Perhaps the worst taste of all is shown in some of the vases which have scrolls and sham metal-work moulded and gilded to produce the effect of a porcelain vase set in or moulu mounts,—a method of so-called decoration which was much imitated at Chelsea and other porcelain works. The recent "Jones bequest" to the South Kensington Museum contains a large variety of the most costly specimens of the *pâte tendre* of Sèvres.

Modern Processes of Porcelain-making at Sèvres.—Since the Franco-Prussian war a large new building has been constructed for this manufacture, with improved kilns, arranged in the most commodious way. It is near the Seine, at the entrance to the park of Saint Cloud. In the same building is the important Ceramic Museum, which contains the finest collection of French porcelain of all periods, and also a large series of showrooms for the exhibition of the modern productions of the manufactory. About 250 hands (men and women) are employed in the work; many of the painters and modellers are, as of old, artists of real ability.

Mixing
and
mould-
ing the
paste.

The *pâte dure*, now mainly used, is composed of kaolinic clay, mostly from Limousin, but also imported from Cornwall; with it is mixed a proportion of white chalk and fine sand (silica). Each material is finely ground between mill-stones, and carefully washed by being agitated with water. The powder is allowed to settle, and the lighter impurities are carried off by decantation. The various ingredients are then mixed thoroughly together with enough water to bring them to the consistence of cream. When the mixing process is complete the cream-like fluid is run off into absorbent plaster troughs, which take up the superfluous water and leave the compound in a pasty state. The paste is next turned over frequently on a floor so as to expose the whole of it to the air, and it

is thoroughly kneaded like baker's dough by men's feet and hands to make it more plastic for the wheel or mould. The wheel turned by the thrower's foot is exactly like that used in Egypt under the Ptolemies, or by the majolica potters, as shown in fig. 55. While moulding his vessel the thrower keeps dipping his hands into a basin of fluid paste ("barbotine" or slip). He also increases the smoothness of surface on the revolving vessel by holding a sponge soaked in the slip between his fingers. Vessels of which a number are required all exactly alike, such as a set of plates, are partly shaped in a mould and partly formed by a steel "template" or gauge. The thrower forces a thin disk of paste over a convex mould shaped to give the inside of the plate; he then sets it, mould and all, on the revolving wheel, and a steel knife-like gauge shuts down upon it, thus forming the outside or back of the plate, which, as it revolves against the edge, has all superfluous paste scraped from it and is accurately formed into the required shape. When the plate or other vessel has been shaped it is allowed to dry, and is finished by being turned on a lathe and rubbed smooth with sand-paper. The handles and all projecting ornaments are moulded, or rather cast, by pouring the paste in a fluid state into piece-moulds made of plaster of Paris, which take to pieces and set free the casting, which is then fixed on the vessel it belongs to with a little more fluid slip used as a "lute." The moulded ornaments are afterwards carefully finished by hand with ordinary modelling tools. Even statuettes and groups of figures are cast and finished in this way. The vase with its attached ornaments, after being thoroughly dried, is ready for the first firing.

The kilns are like tall circular towers tapering towards the top, Firing, about 10 feet in diameter at the base inside; they are divided into four stories, with perforated brick vaults between them. The fire, fed either with white wood or coke, is in the lowest story; the chamber next to the fire is of course the hottest, and the top one the least hot of the three. These different degrees of heat are utilized according to the temperature required for each firing. Thus the "raw" vessels fresh from the wheel, which only require a moderate heat to prepare them for being glazed, are piled in the highest chamber, and those that are being glazed in the lowest. In order to keep the white paste from being discoloured by the smoke the porcelain is packed in round porcelain boxes (called in English "saggers"), which fit closely one upon another and are arranged in high piles. The various chambers of the kilns have small openings, closed with transparent talc, through which the progress of the baking can be watched, and test-bits of porcelain painted with carmine, a colour that changes tint according to the heat it is subjected to, are withdrawn from time to time to show what temperature has been reached. As a rule the fire is kept up for about thirty-six hours, and the kiln with its contents is allowed from four to six days to cool before being opened.

After the first firing the porcelain is in the biscuit state, and is Glazing then ready for the glaze, which is made of felspar and quartz crystals and de- (pure silica); it is finely ground with water, and the porcelain is corating dipped into it, until sufficient of the fluid mixture adheres to the absorbent biscuit to form a coat of glaze. When dry it is fired for the second time, but in the lowest and hottest compartment of the kiln, this natural rock-glaze being very infusible. About 1600° C. is the usual temperature for this process.

The painted decoration is always applied over the glaze; but within recent years a new method of under-glaze ornament has been much used, called "pâte sur pâte," similar in method to the "slip decoration" mentioned above under several different heads. The biscuit ground of the vase is first tinted a uniform colour, and then the same white paste of which the porcelain is made is mixed with water and applied in successive layers with a brush, thus producing delicate cameo-like reliefs. Very beautiful designs of figure-subjects or flowers are put on in this way, and additional effect is gained by the coloured ground shining through the thinner parts of the semi-transparent white reliefs. The whole is then glazed in the usual way. To return to the painted porcelain, when it has come from the second firing in a white highly glazed state it is ready for the painter. Almost endless varieties of coloured pigments are gained by the use of elaborately prepared chemical compounds, all different salts of metals. In the main the blues are from cobalt, the turquoise colour from copper, the rose-pink from gold, the green from chrome and copper, and the violets from manganese. A far greater variety and brilliance of colour can be gained in over-glaze painting than in under-glaze pigments. But the over-glaze colours are very inferior in softness and decorative beauty, and are frequently very harsh and gaudy. Different pigments require different temperatures, and three distinct firings are used at Sèvres for the painting only: they are called "grand feu," "demi-grand feu," and "feu de moufle." Pure gold for the gilt parts in a very finely divided state is obtained by chemical solution and precipitation. The gold requires a special kiln, and firing at a higher temperature than the colour-pigments, and therefore, in the case of *pâte dure*, is applied first. The colours have to be put on and fired in order according to the degree of heat they require, thus very much adding to the painter's difficulties, which are also increased by the

fact that all the colours alter in the kiln, the unfired pigments often bearing no resemblance to their fired state. Thus an elaborately painted and gilt Sèvres vase passes through six separate firings, and often a seventh when it needs final retouching.

The porcelain *à pâte tendre* is now made in small quantities at Sèvres. Its materials have been described above. In most respects it goes through the same processes as the *pâte dure*, but the gold is applied after the painting, as it requires a less degree of heat to fix it on the more fusible glaze used for *pâte tendre*.

Marks.

Modern Sèvres porcelain has two marks—first, the mark of the paste or undecorated vase, painted in green; second, a mark in red or gold to show that it has been painted at Sèvres. Slightly defective pieces in the white glazed state are sometimes sold and decorated elsewhere. In this case the green mark is cancelled by the cut of a lapidary's wheel before it leaves the manufactory. M. Brongniart, in his *Arts Céramiques*, has given a complete set of plates, showing all the processes, the machinery, and the kilns used at Sèvres in his time,—that is, from 1800 to 1847. Other processes are now practised. One is for making very thin cups and saucers, like Eastern "egg-shell china," which are formed by merely rinsing out a plaster mould with fluid paste, when sufficient of the paste to make the thin walls of the cup adheres to the absorbent mould; and thus porcelain is made much thinner than it could be by use of the wheel and lathe. Another recent invention is of great importance in the forming of large vases with bodies thin in proportion to their size. Such would be liable to collapse from their own weight while the paste was soft. To prevent this, the vase is set in an air-tight chamber, its mouth being carefully closed, and the air in the chamber round it is exhausted, so that the soft vase is kept in shape by the expansive pressure of the air within it. The converse method is also used in some cases, by compressed air being forced into the vase. When the paste is sufficiently dry all fear of failure from this cause is over. In this way vases as much as 12 feet in height have been successfully made and fired.

In addition to porcelain shaped and painted after the 18th-century fashions, and the new *pâte sur pâte* process, the present manufactory produces a great deal of fine porcelain copied exactly from the fanciful and elaborate wares of China and Japan, such as the delicate double cups and vases, with outer shells of minute open work pierced through, and many other varieties requiring great technical skill and patience. Unhappily the old faults and misdirected aims still prevent the laboured products of this great factory from having much real artistic value, or even strong decorative effect. The paintings on the porcelain are still pictures like miniatures on ivory, and the treatment and forms of the most elaborate vases are not such as would arise from a natural and rational treatment of plastic clay. The ingenious resources of modern chemistry have produced pigments of countless variety of tint, but they are mostly over-gaudy and harsh in combination; and the modern habit, not peculiar to Sèvres, of applying paintings over the glaze, wilfully rejects the special soft richness of effect which a vitreous coating gives to the pigments under it.

Literature.—On French porcelain, consult Jacquemart, *Histoire de la Céramique*, 1873; Davillier, *Les Porcelaines de Sèvres*, 1870, and *Les Faïences et Porcelaines de Moustiers*, &c., 1863; Jacquemart and Le Blant, *Histoire de la Porcelaine*, 1861-62; Lejeal, *Recherches sur la Porcelaine de Valenciennes*, 1868; Milet, *L'Invention de la Porcelaine à Rouen*, 1867; *Guide du Visiteur*, Sèvres, 1874; Cool, *Peinture sur Porcelaine*, 1866; Bastenaire-Daudenart, *L'Art de fabriquer la Porcelaine*, 1827. See also the general list of works on ceramic art.

German and Austrian.

The porcelain of Germany was, from the first, composed of a hard natural paste, a true kaolinic clay. Its successful production was the result of a single, almost accidental, act of discovery, and not, like that of the French, of a long series of experiments with different materials, ending in the invention of a highly artificial imitation of true porcelain.

Böttger.

In the year 1700 a young chemist, or rather alchemist, of great ability, called Frederick Böttger (1682-1719), a native of Saxony, fled to Dresden, under the accusation of practising magical arts and searching for the "philosopher's stone." He was there taken under the protection of Augustus II., elector of Saxony, who employed him to make experiments, at first connected with medical chemistry and afterwards with the composition of pastes and clays for ceramic ware. From 1701 he worked for his royal patron, partly at Dresden and partly at the castle of Meissen, carefully guarded, and kept in seclusion almost like a prisoner, in order that his discoveries might remain secret, and also to prevent his leaving the country. For nine years Böttger only produced stoneware, though of a finer and harder quality than had hitherto been made

(see pp. 630-31); but in 1710 he seems to have been in some way set on the track of the secret of porcelain manufacture. His first attempts were unsuccessful: the paste is grey and defective, and there is little or no glaze. So far no real progress had been made towards the discovery of true porcelain. But in 1710 a lucky accident, combined with the young chemist's ready powers of observation, revealed the true nature of the required paste. Having noticed the unusual weight of some new hair-powder with which his wig was dressed, he inquired what it was made of, and, finding that it was a finely-powdered white clay from Aue, near Schneeberg in Saxony, he procured some of the clay. He made vessels of it and fired them, and found that he had discovered the material of true hard porcelain, like that from China and Japan. When Augustus II. learned the importance of the discovery he established the porcelain manufactory at Meissen with Böttger as its director. This establishment, 15 miles from Dresden, was more like a prison than a factory, being surrounded by high walls and shut in by portcullises: none except workmen were ever admitted, and they were sworn to secrecy under pain of penal servitude for life. The kaolin from Aue was dug out, packed in sealed bags, and brought to Meissen with every care possible to avoid betraying the secret of its importance; no possible precaution was omitted, and yet, in one case at least, all attempts to keep the monopoly were in vain (see below, "Vienna porcelain").

The earliest productions of the Meissen (Dresden) porcelain-works are copies from the Chinese and Japanese. Some are plain white, with flowers or fruit in low relief; others have painted under-glaze in blues only, like the celebrated blue and white china of Nanking. The first pieces painted with other colours are imitations of old Japanese china in green and red with enrichments in gold. Böttger died in 1719, and was succeeded in his directorship by George Höroldt, who introduced certain improvements in the processes of the manufacture, and increased the quantity of its annual production. In his time Chinese designs were still copied, mostly very ugly figure-subjects on white panels, the rest of the vase being coloured yellow, green, or grey, and decorated with elaborate gilt scroll-work in the worst possible taste.

After about 1725 the Eastern style of design was superseded by elaborate miniature paintings of flowers and insects, or copies from Dutch and Flemish painters. All notion of true ceramic decoration was gone, and the porcelain was only regarded as a ground on which to paint an imitation of an oil-painting. Another style of decoration soon came into fashion: china was decorated in relief with the "honeycomb" or "may-flower" pattern.

In the latter kind (see fig. 70) the vessel is closely studded with blossoms of the may, moulded in a realistic way, with thin crisp edges, and then coloured and gilded, very laborious to execute, and extremely disagree-

FIG. 70.—Dresden vase, *pâte dure*; may-flower pattern in relief, coloured blue and gold. (South Kensington Museum.)

able in effect. Perhaps the chief specialty of Dresden porcelain consists in its statuettes and group of figures, the best of which were made between 1731 and 1756 under the superintendence of a sculptor named Kändler. Some of these, especially the Watteau-like shepherds and shepherdesses, have a sort of feeble prettiness; but most have only little merit, and some are grotesque and wilfully ugly. They are generally decorated with colours and gilding; the best, however, are in plain glazed white. Elaborate candelabra, clocks, and other objects were largely made, into the designs of which figures in the round, flowers realistically modelled, and rococo scroll-work were introduced, generally in a feeble and ungraceful way. For some years after 1774 designs of more classical form, purer in outline and less crowded with clumsy ornament, came into fashion. Since then nothing of any real value has been produced in the Dresden china-works. Of late years, since the increase of prices given for old Dresden, the directors of the manufactory have begun to reproduce their old designs, and even to use some of the worn-out moulds; the result is that the china thus produced is very blunt and spiritless, quite devoid of merit.

The old Dresden porcelain is of a fine paste, and has a good glaze, but its white is of a rather cold tint, occasionally even having a bluish shade. It is, however, both in quality of material and in design, the best porcelain that Germany has produced. During the early period the monogram "AR" interlaced (for Augustus Rex) marks the pieces made either for the king's use or from his design. Between 1712 and 1715 pieces made for sale were marked with a rudely-sketched snake twining round a stick. Since 1721 two crossed swords have been used as a general mark; the addition of a dot or star marks special periods (see No. 30). The swords were the arms of the elector of Saxony as arch-marshal of the empire. Some pieces have "MPM" for "Meissenen Porzellan Manufaktur." As at Sèvres, china from Dresden, if sold undecorated, has the cross-swords mark cancelled by the cut of a wheel. In 1863 the china-works were moved from the fortress of Meissen and established in a new and more convenient building.

Vienna
porce-
lain.

Vienna Porcelain.—In 1720 one of the workmen escaped from the prison-like manufactory of Meissen and brought the secrets of the porcelain clay to Vienna, where he set up kilns and workshops in partnership with a Frenchman named Du Pasquier. They obtained a special patent, but had little practical success; and the Vienna porcelain was not made in large quantities till after 1744, when the manufactory was carried on under the patronage of Maria Theresa and the emperor Joseph. In 1785 there were thirty-five kilns in working order, and 500 work-people were employed. Vienna porcelain is not of a pure white, but is greyish in tint; its paintings are very poor, and it depends for its effect chiefly on gilt-moulded scroll-work in delicate relief. Its manufacture was suspended in 1864 on account of the heavy expense it entailed on the Austrian Government.

Berlin
porce-
lain.

Berlin porcelain was first made in 1751 by a potter named Wegely, who marked his ware with No. 31. It was not, however, a commercial success till Frederick the Great took it in hand. He sent a number of skilled workmen from the Meissen (Dresden) china-works to Berlin, and also ordered the manufactory to be supplied with the kaolinic clay from Aue, of which Meissen hitherto had preserved the monopoly. In quality the Berlin porcelain comes next to that of Dresden; it is often decorated with a bright rose-pink, the favourite colour of Frederick, which was unknown at the Meissen works. Large quantities of porcelain are still made at Berlin.

Other Continental Porcelain of the 18th Century.

A very large number of other places in Germany produced hard natural porcelain during the 18th century, but none of their work is of any special interest or beauty. It became, in fact, the fashion for every king or reigning

prince to be the patron of a porcelain manufactory. Porcelain was produced at Amsterdam and The Hague; at Brussels, Copenhagen, and Zurich; and in Russia at St Petersburg and Moscow.

In Italy also fine soft porcelain was made,—at Doccia as early as 1735, some of which, ornamented in under-glaze blues only, is very decorative and in good taste. Venice produced clever copies of Japanese porcelain, painted with chrysanthemums and other flowers in enamel. The royal manufactory at Capo di Monte, close to Naples, founded in 1736 by Charles III., produced a great deal of porcelain decorated in many styles, mostly in very bad taste.

Potter's marks. No. 32.

The best are Oriental designs painted in blues only. The accompanying marks (No. 32) were used, the fleur-de-lis in 1736, the crowned N after 1759, and the RF after 1780. All the Italian porcelain is of the soft artificial sort.

The porcelain-works in the Buen-Retiro gardens at Madrid were also established by Charles III. after he succeeded to the throne of Spain. Much of this (soft) porcelain is classical in form, and is decorated with miniature paintings in colours or monochrome. Charles III. transferred thirty-two workmen and painters from Capo di Monte when he founded the Buen-Retiro manufactory, and hence the productions of the two factories are very similar in style. One of the marks used, the lis, was common to both; the usual forms on the Buen-Retiro porcelain were those in No. 33.

"Porzellan."

English.

The early history of English porcelain is rather obscure. John Dwight (see p. 632 above) was apparently the first English manufacturer who took out a patent for the production of transparent porcelain; but no specimens made by him are now known.

Chelsea Porcelain.—According to Jewitt (*Ceramic Art Chelsea of Great Britain*), John Dwight probably founded the porcelain-works at Chelsea, which rank first among English manufactories both in date and importance. In 1745 they were in full activity; and the popularity in France of English porcelain was one of the causes which led to the establishment of the royal manufactory at Sèvres. The owner of the Chelsea works was a Frenchman called Nicholas Spremont, who continued to manufacture fine porcelain till his retirement from business in 1764.

This porcelain is very varied in style, as was the case with most of the 18th-century makes. Some of it is simply imitated from Eastern china, either in blue and white, or in the old Japanese style, which was then so popular, chiefly painted in rich red and green, with a good deal of gilding. Other pieces, more elaborate and costly, resemble Sèvres porcelain, and have miniature paintings on white panels, the rest of the vase being coloured with one uniform tint, such as the French *bleu du roi* or "rose Pompadour." One colour, peculiar to Chelsea, is a deep claret-red. Most of the vases have a great deal of gilding, both applied in patterns on the body of the vase, and also used solidly to decorate the elaborate moulded scroll-work which was fixed on the sides of the porcelain. The writhing masses of gold on Chelsea ware are probably the most meaningless and stupid attempts at decora-

tion that have ever been produced. Many of them are designed with apparently not even an attempt at beauty of form or gracefulness of curve, and are quite without the vigour that is often possessed by the grotesques of China or Japan. Chelsea vases of this elaborate sort are rare, as their production was slow, and they now fetch very high prices: £2000 has been given for a single vase such as that shown in fig. 71.

Fig. 71.—Early Chelsea vase, dark-blue body, with composed kaolinic clay of Cornhill about 1755 by Cookworthy, all English porcelain was of the soft variety (*à pâte tendre*), and was really an artificial compound with an ordinary vitreous lead glaze. The painted decoration, like that of Sèvres, was applied over the glaze, with the exception of a fine cobalt blue, which was painted on the china in a biscuit state. This colour is much the finest and most truly decorative of any of the pigments, very superior in richness of effect to the much brighter over-glaze colours. That used at the Derby porcelain-works is the most beautiful in tint.

The early success of the Chelsea porcelain was partly due to the patronage of George II., who, following the royal fashion of the age, took a great interest in the manufactory, and not only bought large quantities of its productions but also aided it by importing kaolinic clay, models, and even skilled workmen from Saxony. In 1769 the Chelsea porcelain-works were put up to auction, and bought by William Duesbury, the owner of the Derby china-factory. Till 1784 he carried on the manufacture of porcelain at both places, but in that year he pulled down the Chelsea kilns and transferred all the movable plant and the workmen to Derby. The Chelsea mark is usually an anchor, either painted in red or gold, or moulded in relief; the anchor is often double (see No. 34), and in some cases has the addition of one or more daggers. Some specimens first noted by Mr. Jewitt¹ have quite different marks, incised on the paste before glazing, which are of special interest as being the earliest dated specimens of English porcelain. Such marks are a triangle, with the addition "Chelsea 1745."

Bow Porcelain. (Stratford-le-Bow).—In 1744 Edward Heylyn and Thomas Frye, the latter a painter of some repute, took out a patent for the manufacture of porcelain at Bow. The composition they used was a curious one, being almost a hard porcelain. The clay, which was called "unaker," was brought from America, and was probably an impure kind of kaolin. It was ground and washed to separate the sand and mica; and to it was added pounded glass—a pure alkaline silicate—varying in proportion from

Potter's marks. No. 34.

equal parts of clay and glass to one-fifth of glass. The glaze was a similar mixture, with less of the American kaolinic clay. This paste and glaze must have been difficult to manage, since in 1748 the partners took out a fresh patent for a more artificial and softer kind of porcelain, with a more fusible lead glaze. In 1750 the Bow works came into the hands of Messrs Weatherby and Crowther, and were then called "New Canton." For some time the manufactory was successful, and employed 300 hands; but before long one of the partners died, and the survivor, "John Crowther, *chinaman*," was gazetted bankrupt in 1763, and the whole stock was sold off. Crowther, however, in spite of his failure, carried on the works till 1775, when they were bought by William Duesbury, the owner of the Chelsea, Derby, and other china-factories; he pulled down the Bow kilns and transferred the plant to Derby, as he did afterwards in the case of the Chelsea manufactory. The Bow porcelain is of a fine soft milky white; many of the imitations of Chinese figures are hardly to be distinguished from the originals. Some of the Bow china, decorated only in the rich under-glaze blue, with Eastern designs, is very effective. A good many pieces are painted in the Dresden style, and coloured statuettes or groups of figures, also after German models, were largely produced. The Bow marks are very numerous, some not distinguishable from those of Chelsea; No. 35 shows four varieties.

Potter's marks. No. 35.

Derby porcelain is supposed to have been made as early as 1750, possibly by Andrew Planché, a clever French refugee, who in 1756 entered into partnership with Heath and Duesbury, the last of whom afterwards became the chief china-manufacturer of England. The purchase by Duesbury of the Bow and Chelsea works has already been mentioned. The Derby porcelain is often very large, elaborately moulded, and profusely decorated, generally rather in the Dresden style, weak in form and gaudy in colour. The Derby under-glaze blue was remarkably fine, and many of the plain blue and white pieces, with Chinese patterns, are highly decorative, as are also, though in a less degree, those porcelain services that were painted in the "old Japanese style." One of the chief specialties of the Derby works was the production of delicate white figures in biscuit china, often modelled with great skill and refinement. Unfortunately the practice of *printing* the under-glaze patterns, instead of painting them by hand, was introduced at Derby about 1764, and did much to destroy all the artistic value of the work (see below). The marks used were these,—first a "D" combined with an anchor (No. 36), or a crowned anchor (No. 37), used during the earlier part of the time when Duesbury was carrying on both the Chelsea and the Derby factories, 1769-84; next the crown was used, either over the "D" only (No. 38), or, more usually, with a saltire or crossed

No. 36.

No. 37.

No. 38.

No. 39.

Potters' marks.

swords immediately under it. Another variety has crossed lines under the crown (No. 39). The Derby works continued in the possession of the Duesbury family till 1814 or 1815, when Robert Bloor became the lessee and finally

¹ See "History of Chelsea China," in *Art Journal* for 1863.

the owner of the place. He soon realized a large fortune, though to some extent at the expense of the credit and high reputation for excellence of work which had been gained and kept up by the various members of the Duesbury family. He gained a great deal of money by selling off the stock, accumulated during many years, of slightly defective pieces of porcelain, which the Duesbury family would not allow to go into the market.¹

Worcester Porcelain.—The china-works at Worcester were founded by a very remarkable man—Dr Wall, who appears to have possessed unusual skill as a physician, artist, and chemist. After some years spent in attempts to discover a fine artificial porcelain, he, in conjunction with other practical men and capitalists, started the Worcester Porcelain Company in 1751. The early productions of this factory are very artistic; they are chiefly copies of the fine Nanking porcelain, painted under-glaze in blues only, with very boldly decorative designs. Old Japanese ware was also successfully imitated. After that the most ambitious pieces of Worcester porcelain were mostly dull reproductions of the elaborately painted wares of Sévres and Chelsea. Transfer printing was first used at Worcester for designs on china in 1756, though it had been invented and employed some years earlier for the decoration of the Battersea enamelled copper. This process was no less injurious at Worcester than elsewhere to the artistic value of the paintings. Dr Wall died in 1776, and after that the porcelain-works passed through various hands. A great impetus was given to its success by George III., who visited the factory in 1788 and granted it the title of "The Royal Porcelain Works." The earliest marks are a "W" or a crescent; others used are crossed arrows or varieties of sham Chinese marks (see No. 40).² The manufacture of china at Worcester is still continued with great activity; the fineness of the paste and the skilful processes employed leave nothing to be desired. Unfortunately the old fault of a too realistically pictorial style of painted decoration still prevails, and an immense amount of artistic skill and patient labour is practically wasted in producing minute but not truly decorative work. Some of the modern Worcester copies of Eastern porcelain and enamels are very delicate and beautiful, and the cameo-like method of *pâte sur pâte* decoration is practised with great skill and often good effect.

Bristol porcelain. *Bristol porcelain* is of interest as being the first hard natural porcelain made in England. As early as 1766 attempts were made by Richard Champion to make an artificial paste, with the help of the American "unaker" or kaolinic clay, which was being used successfully at Bow, but no results of any importance seem to have followed his experiments. The successful production of Bristol porcelain was due to the discovery in Cornwall of large beds of kaolinic "growan" stone or "china" stone, first brought into use by William Cookworthy, a Plymouth potter. This discovery and the succeeding one of similar beds in Devonshire were of great commercial importance to England, and the beds have ever since produced enormous quantities of material for the manufacture of fine hard porcelain both in England and abroad.

This china stone (see Cock, *Treatise on China Clay*, 1880) is not a pure kaolinic clay like that found in China, but is simply a granitic rock, partially decomposed, and soft and friable, but still retaining both quartz and mica in addition to the felspar, which is the essential base of kaolin. In China the processes of nature have carried the decomposition and sorting of the different com-

ponent parts of granite to a further stage. There the decomposed felspar has, by the action of rain and running streams, been deposited in an almost pure and finely-divided state in beds by itself, almost free from quartz and flakes of mica. In using the Cornish china stone, therefore, various natural processes have to be artificially performed before the paste is sufficiently white and pure for use; but when this is done it is little if any inferior to the Chinese kaolin. The stone when dug out is white with grey specks, and is so friable as to be easily reduced to powder between mill-stones. It is agitated with water, and run through a series of settling troughs; thus the lighter flakes of mica, which are very injurious to the paste, are washed away, and the pure felspathic kaolin is deposited free from impurities. Free silica is added in a fixed proportion; it is usually obtained from flints, first calcined and then finely ground to powder, which are an important ingredient in the composition of both fine pottery and porcelain. The Jermyn Street Museum has a complete collection of all the materials used in china manufacture.

William Cookworthy at once recognized the value of his discovery, and set up china-works both at Plymouth and at Bristol. No. 41 shows the mark of the Plymouth porcelain, and No. 42 those that were used at Bristol. In 1774 he sold the Bristol factory to Richard Champion, still retaining a large royalty on the china stone. Champion signed his ware with

No. 41. No. 42. No. 43. No. 44.
Potters' marks.

continued till 1781, when the works were sold to a Staffordshire company, and the manufacture of hard porcelain was no longer carried on there. Though fine in paste and unusually transparent, the Bristol porcelain has no special artistic merits. As with most other English wares, the best in colour and design are copies, with more or less adaptation from Eastern china; some of them are very large and magnificent. The figures and flower-reliefs in biscuit porcelain are also delicate, and often cleverly modelled, with wonderful realism.

Some fine blue and white china was produced towards the end of the last century at Lowestoft, and at Liverpool as early as 1756; and many other china-works were established in various parts of England. In the beginning of the present century Swansea and Nantgarw in South Wales produced porcelain which was highly esteemed; but the delicate shades of difference in the paste, glazes, and styles of decoration of these numerous varieties of British porcelain are not such as can be described in a few words; nothing but careful examination of the wares themselves will enable the student to distinguish between the productions of the different manufactories. Swansea ware bears various marks, of which No. 44 is one example.

Modern Methods of Manufacture.—The methods and materials now employed at Sévres in the production of porcelain are in all essential points much the same as those practised elsewhere (see above). The chief centre in England of the manufacture of pottery or non-translucent earthenware is in Staffordshire, near the borders of Cheshire, where a large district devoted to this industry goes by the name of "The Potteries." Worcester, Lambeth, and many other places in England also turn out annually large quantities of pottery. The processes employed may be divided under the following heads:—(1) choice and mixture of clays; (2) washing and grinding the materials; (3) throwing on the wheel and moulding; (4) kilns and methods of firing; (5) glazes; (6) pigments and methods of decoration.

1. *Choice and Mixture of Clays.*—The extensive beds of fine Dorset Mixture or Poole clay supply the chief ingredient in the manufacture of English pottery. This is too fat a clay to be used alone, and is therefore mixed with a certain proportion of free silica to prevent it from twisting or cracking in the kiln. Another ingredient is added to the mixture for the finer wares, namely, the Cornish or Devonian china stone, a kaolinic substance used in the manufacture of porcelain (see above), which makes the paste finer in texture, whiter, harder, and less brittle. These three substances are mixed in various proportions. The following makes a fine cream-coloured ware,—Dorset clay 56 to 66 parts, silica (flint) 14 to 20, china stone 17 to 30 parts.

¹ See Haslem, *Old Derby China Factory*, 1876.

² For fuller information, see Binns, *Potting in Worcester*, 1865.

Preparation of materials. 2. *Washing and Grinding the Materials.*—The Dorset or Poole clay is finely ground between mill-stones, mixed with water to the consistency of cream or slip, and then passed through fine silk sieves to strain out all grit or palpable particles. The china stone is treated in the same way, with the additional precaution of washing away all the flakes of mica, which come from the decomposition of the granitic rock from which the china stone is derived. The silica is obtained from flints, which are easily ground to fine powder after being heated red-hot and thrown into water. These three substances, brought into the state of fluid slip, are repeatedly pumped up from vats and passed through the sieves; they are then easily mixed in due proportion by being pumped into graduated vats. The water is next evaporated from the fluid mixture in large boilers heated by a complicated arrangement of flues, and the compound is left in a soft pasty state, full of air-bubbles, which have to be got rid of by constantly turning over and beating the paste till it is quite smooth and compact, and sufficiently plastic to be thrown on the wheel. Coloured earthenware, such as that Wedgwood used to make, was prepared by the addition of various substances to the fluid slip. A black colour was given by protoxide of iron and manganese, red by red ochres or red oxide of iron, blue by oxide of cobalt, and green by protoxide of chrome. These coloured pastes are but little used now.

Throwing and moulding. 3. *Throwing and Moulding.*—After sufficient kneading, the clay is made up into balls of a convenient size for the thrower to mould into shape upon his wheel. The methods both of throwing and of moulding are the same for porcelain as for pottery (see p. 638 above). Unfortunately in England, as at Sèvres, the thrown vessels are usually finished on the lathe; only the commonest kinds of ware escape this process, which takes away all life and spirit from the wheel-formed pottery. Consequently it is the cheapest and commonest wares that now, as a rule, have most natural beauty of form and really artistic spirit. Handles and other parts which are shaped in piece-moulds are either cast by pouring fluid slip into the plaster-moulds, or are formed by pressing and dabbing thinly-rolled pieces of soft clay into moulds made in two parts. The moulded halves of the spout or handle are fastened together while still wet, and the edges at the junction pared down and trimmed with a modelling tool. Plates, basins, and the like are formed by the combination of a mould and a shaped gauge as described above (Sèvres).

Kilns and firing. 4. *Kilns and Firing.*—After the vessel with its moulded handles or spout is thoroughly dry it is ready for the first firing. The usual Staffordshire biscuit-kiln is a circular building, about 18 feet in internal diameter at the base, narrowing towards the top. It is about 18 to 20 feet high, and is very carefully built of refractory fire-bricks, strengthened by rings of wrought-iron which clasp the outside. It is surrounded by eight to ten furnace openings, with flues arranged to distribute the heat equally throughout the kiln. The pottery is fired in drum-shaped "saggers" or boxes, made of fire-clay, which are piled one above the other, as in the case of the Sèvres porcelain. The fire is kept up from thirty to fifty hours, and is then allowed to die out. Several days are allowed for cooling before the kiln is opened and the saggers with their contents withdrawn.

Glazes. 5. *Glazes.*—The composition of glazes for pottery varies very much according to the custom of each manufacturer. For the most part they are transparent silicates of alumina, rendered fusible by oxide of lead; this compound is made by a mixture of Cornish china stone, flint, and white lead. The best quality of glazes have borax and some alkali added as a flux, in which case the proportion of lead is reduced. Those glazes that contain much lead are easily scratched, and can be decomposed by many acids; thus there is always a risk of lead-poisoning if vessels coated in this way are used for cooking purposes. The materials for the glaze are finely ground with water and made into a thin white fluid. The biscuit pottery is rapidly dipped into vats of the milky mixture, and sufficient to form the glaze adheres to the absorbent clay in an even coating all over the surface. After being dried the pottery is ready for the second firing in the glazing kiln, which is very similar in construction to the biscuit-kiln, only, as a rule, rather smaller. It is packed in clay saggers, as in the first firing, but a stronger heat is required to fuse the finer kinds of glaze than was necessary for the baking of the raw pottery. Salt-glazing has been described above (p. 632), and is only used for the coarser sorts of ware.

Decoration. 6. *Methods of Decoration.*—In the case of pottery decoration is usually applied on the biscuit-ware before it is glazed by the transfer-printing process. The required design is engraved on copper plates; the pigment is ground fine and mixed with a tenacious compound of oil and gums. An ordinary rolling press is used to print the engraved patterns in the oily pigment upon strips of tissue-paper, which are carefully applied and pressed face down-

wards on the biscuit-ware while the oil is yet wet; and so the pattern is transferred to the absorbent clay. This requires great dexterity from the difficulty there is in fitting the printed strips neatly on to curved surfaces. The paper is then washed off, and the printed ware is baked at a moderate temperature in what is called the "hardening" kiln, which is done before the glaze is applied, in order to drive off the oily medium with which the pigment was mixed. The transfer process is quite fatal to all artistic beauty in the designs; it is hard, clumsy, and mechanical, the very opposite of a rational method for the decoration of pottery, which above all things demands freedom of hand and a spirited touch. Painted decoration which is executed by hand is now usually applied over the glaze, both because it is easier to do, not requiring so certain a touch, and also because the soft subdued colours of the under-glaze pigments do not suit the modern taste for what is bright and showy. The pigments used are necessarily oxides and salts of metals which will stand the heat of the kiln. Only those few which can stand the very high temperature of the glazing kiln can be used under the glaze. The over-glaze colours, on the other hand, only need sufficient heat to fix them on the surface of the already fired glaze; and this is often done in a very slight and imperfect way. These colours not only lose in effect from want of the softening vitreous coat through which under-glaze colours are seen, but they are also very inferior through being unprotected, and therefore easily injured by scratches and ordinary wear. In old times the value of a protecting coat of glaze was so strongly felt that even paintings on enamel, like those on Persian pottery and Italian majolica, usually had a thin vitreous glaze added over the smooth enamel, with the double object of protecting the painting and increasing its soft richness of effect.

The discoveries of modern chemistry have added very greatly to the number of metallic salts which are available for the decoration of pottery. Almost every possible tint can be produced for over-glaze painting. Oxides of cobalt are used for various shades of blue and grey up to black; antimony, usually combined with lead, gives yellow; oxides of copper give deep red or brilliant blues and greens according to the proportion of oxygen that they contain; oxide of chromium gives a good quiet green; manganese gives violet and even black; gold gives a fine ruby red; and uranium a rich orange. The various oxides of iron give a great variety of colours,—reds, yellows, and browns. Oxide of zinc is largely used, not as a pigment in itself, but in combination, to modify other colours. The oxides of iron, cobalt, and chromium give very stable colours, capable of bearing a very high temperature, and can therefore be used for under-glaze painting; most of the others can only be employed for over-glaze work. Over-glaze pigments cannot be used alone, but require a flux to make them combine with the glaze. Oxide of lead, borax, nitre, carbonates of potash or soda, and other substances are used for this purpose.

Literature.—English porcelain: Nightingale, *Early English Porcelain*, 1881; Binnis, *Pottery in Worcester*, 2d ed. 1877; Owen, *Ceramic Art in Bristol*, &c., 1878; Porter, *Manufacture of Porcelain*, &c., 1832; Tiffin, *Chronograph of Bow, Chelsea, and Derby Porcelain*, 1875; Wallis and Benrose, *Pottery and Porcelain of Derbyshire*, 1870; Jewitt, *Ceramic Art of Great Britain*, 1877,—the most complete and comprehensive work.

Museums illustrative of the General History of Pottery.—The Musée Céramique Mu- of Sèvres is the best and most complete for the student of all kinds of pottery. In England the Jermyn Street Museum of Geology has a small but very widely-illustrative collection of pottery and the various materials used in its manufacture. The South Kensington Museum is rich in almost all kinds of medieval and modern pottery, but it is unfortunately very badly arranged. The British Museum possesses a very large number of specimens of prehistoric pottery, Greek vases, mediæval English, and very choice examples of Persian and majolica wares. The other chief European museums are mostly each rich in some special department of ceramic art.

General Literature on Pottery.—Brongniart, *Traité des Arts Céramiques*, 1854; Jacquemart, *Histoire de la Céramique*, 1873; Marryat, *Pottery and Porcelain*, 3d ed., 1868; Birch, *Ancient Pottery*, 1873; *Catalogue of Pottery*, Museum of Geology, Jermyn Street, 1876 (a very useful and well-illustrated work); Bonneville and Jaumez, *Les Arts Céramiques*, 1873; Brongniart and Riocreux, *Musée de Sèvres*, 1845; Figuière, *Les Merveilles de l'Industrie*, 1873-75; Greslon, *Recherches sur la Céramique*, 1864; Guillery, *Les Arts Céramiques*, 1854; Jacquemart, *Les Merveilles de la Céramique*, 1866-69; Magnier, *Manuel du Porcelainier*, Faïencier, &c., 1864; Mareschal, *Les Faïences Anciennes et Modernes*, 1887; Maze, *Recherches sur la Céramique*, 1870; Ris-Paquot, *Histoire de la Faïence Ancienne*, 1873-74; Salvétat, *Leçons de Céramique*, 1867; Waring, *Ceramic Art in Remote Ages*, 1875; Ziegler, *Études Céramiques*, 1850; Jännicke, *Grundriss der Keramik*, Stuttgart, 1879; Champfleury, *Bibliographie Céramique*, Paris, 1881 (gives a very large and complete list of works on pottery and porcelain, in all languages); Soden Smith, *List of Works on Pottery and Porcelain in the Kensington Art Library*, 1875.

On Pottery and Porcelain Marks the reader may consult Barth, *Porcellan-Marken und Monogramme*, 1873; Chaffers, *Handbook of Marks and Monograms*, 1874; Demmin, *Guide de l'Amateur de Faïences et Porcelaines*, 1873; Graesse, *Guide de l'Amateur de Porcelaines*, &c., 1873; Palliser, *The China Collector's Companion*, 1874-75; Ris-Paquot, *Dictionnaire des Marques et Monogrammes*, 1874; Hooper and Phillips, *Manual of Marks*, 1876; Bowes, *Japanese Marks*, 1882. Many other lists of ceramic marks occur also in the various works mentioned under previous heads. (J. H. M.)

POTTSTOWN, a borough of Montgomery county, Pennsylvania, United States, is picturesquely situated on the Schuylkill river, in a plain surrounded by hills. It is 18 miles east-south-east of Reading and 40 miles west-

north-west of Philadelphia, at the junction of the Philadelphia and Reading (main line) and the Colebrookdale Railroads, and has communication also by the Schuylkill Valley branch of the Pennsylvania Railroad. There are

in and near Pottstown six rolling-mills, two blast-furnaces, three iron and brass foundries, two nail-factories, and large bridge works, besides minor industries. The population of Pottstown was 4125 in 1870, and 5305 in 1880.

POTTSVILLE, a city of the United States, capital of Schuylkill county, Pennsylvania, lies 35 miles north-west of Reading, on the north side of the Schuylkill river, in the gap by which it breaks through Sharp Mountain. It is the terminus of the main line of the Philadelphia and Reading Railroad, and the great emporium of the Schuylkill coal region, which extends north and east and west, and has an annual yield of about 6,000,000 tons. Furnaces, rolling-mills, machine-shops, planing-mills, a spike-mill, a pottery, &c., are among the industrial establishments; and the public institutions include a court-house, a jail, a town-hall, a union hall, an opera-house, a children's home, a lyceum, and a free reading-room. The German and Welsh elements in the population are strong enough to be represented each by several churches. Pottsville as a city dates from 1825. In 1850 it had 7515 inhabitants, 12,384 in 1870, and 13,253 in 1880.

POUGHKEEPSIE, a city of the United States, capital of Dutchess county, New York, lies on the east bank of the Hudson river, 73 miles north of New York. It is on the New York Central and Hudson River Railroad, and communicates with the New York, West Shore, and Buffalo Railway by ferry from Highland, and with the Hartford and Connecticut Western Railroad by the Poughkeepsie, Hartford, and Boston Railroad (37 miles). The site consists for the most part of a tableland which rises from 150 to 200 feet above the river, and is backed towards the east by College Hill, 300 feet in height. Well laid out with regular and shaded streets and abundantly supplied with water (pumped from the river to a reservoir on College Hill), Poughkeepsie is a pleasant place of residence, and it enjoys a special reputation for its educational institutions. Vassar College (2 miles east of the city), the earliest and one of the greatest women's colleges in the world, was founded and endowed in 1861 by Matthew Vassar, a wealthy Poughkeepsie brewer; in 1884 it had 300 students, and possessed a library of 14,150 volumes, together with collections of water-colours and of American birds, both of great value, an astronomical observatory, and a chemical laboratory. Two miles north of the city, on an eminence above the Hudson, stands the Hudson River State Hospital for the Insane, an immense building erected between 1867 and 1871, with 300 acres of ground attached. Within the city are an opera-house, a free public library, a large young men's Christian association building with a free reading-room, St Barnabas and Vassar Brothers Hospital, and homes for aged men and women. It also contains iron-furnaces, breweries, and manufactories of shoes, glass, mowing machines, pottery, hardware, and various minor industries. The population was 14,726 in 1860, 20,080 in 1870, and 20,207 in 1880.

Poughkeepsie (forty-two different spellings of the name are said to be found in old records) was settled by the Dutch about 1698-1700. Two sessions of the State legislature were held in the place in 1778 and 1779; the former gave assent to the articles of confederation, and the latter ratified the national constitution. The city charter dates from 1854.

POULPE, or **OCTOPUS**. See **CUTTLE-FISH**, vol. vi. p. 735, and **MOLLUSCA**, vol. xvi. p. 669 sq.

POULTRY. The term "poultry" (Fr. *oiseaux de basse cour*) is usually regarded as including the whole of the domesticated birds reclaimed by man for the sake of their flesh and their eggs.¹ The most important are the Common Fowl, which is remarkable as having no distinctive English

name, the Turkey, and the Guinea-fowl, all members of the family of birds known as *Phasianidae*. The Pheasants themselves, belonging to the restricted genus *Phasianus*, are not capable of being domesticated, and the Peacock is to be regarded rather as an ornamental than as a poultry bird. The aquatic birds which are strictly entitled to be considered domesticated poultry are the Duck and the Goose, two species of the latter having been perfectly reclaimed.

The common fowl belongs to the restricted genus *Gallus*, of which four wild species are known,—the Bankiva Jungle fowl (*G. ferrugineus*), the Sonnerat Jungle fowl (*G. sonnerati*), the Ceylon Jungle fowl (*G. stanleyi*), and the Forked-tail Jungle fowl (*G. furcatus*). The range of these species is given under FOWL (vol. ix. pp. 491-492). The origin of the domesticated breeds is ascribed by Darwin, Blyth, and other naturalists to the Bankiva fowl, much stress being laid on the comparative want of fertility in the hybrids produced between this species or the domesticated breeds and the other three forms of wild *Galli*, but it is probable that this want of fertility was due in great part to the unnatural conditions under which the parent and offspring were placed, as, if bred under more natural conditions, there is no difficulty in rearing these hybrids or in breeding from them with the domesticated varieties. The number of distinctive breeds of the domesticated fowl has very greatly increased of late years, owing to the emulation excited by poultry shows. Darwin, in his *Variation of Animals, &c., under Domestication*, enumerated thirteen principal breeds with numerous sub-varieties, but several very distinctive races have come into notice during the last ten years, varieties having been formed by careful selection that may be relied on for reproducing their own distinctive peculiarities in the descendants, and hence constituting what are regarded by fanciers as pure breeds. The classification of the known varieties is not an easy task; each is capable of interbreeding with every other, and so great an intermixture of local races has taken place that the arrangement of the breeds is as difficult in poultry as in dogs.

Game Fowls.—Game fowls differ less from the wild Bankiva than any other variety; they are, however, considerably larger, and carry the tail more erect than the wild birds. In some parts of India sportsmen find it not easy to distinguish between the wild and the domesticated birds. Game fowls in England have been long cultivated not only as useful poultry but on account of their combative tendencies, which have become so intensified by careful selection that they have extended even to the other sex, and hens have been not unfrequently fought in the cock-pit. The comb in the Game is single, the beak massive, the spurs strong and very sharp. There is a tendency towards the assumption of the female plumage by the males, and distinct breeds of "henry" Game are known. The peculiarity is not associated with any loss of combativeness, the birds being highly valued for their courage and endurance in the pit. Economically considered, Game are highly esteemed for the table on account of their plumpness, the amount of the breast-meat, owing to the size of the pectoral muscles, being very great, from which cause, combined with their hardihood, they are most valuable for crossing with other breeds, as the Dorking. English-bred Game have been reared of many varieties of colour, retaining in all cases their distinctive peculiarities of form. Within the last few years Game fowls have been reduced in size by selective breeding, and the exceedingly minute Game bantams have been produced with the distinguishing characters of the larger breed. During the last twenty years Game fowls have been considerably altered in form, owing to the influence of poultry shows,—the legs and necks having been greatly lengthened. This has been

¹ Although pigeons are not generally included among poultry, yet, on account of their close connexion, it has been deemed advisable to add a short section on them to this article.

accomplished by careful selection in breeding and not by crossing with any other breed.

Malayan Fowls.—The Malayan type has been long recognized as of Eastern origin. The birds are of large size, close and scant in plumage, with very long legs and necks. The *Gallus giganteus* of Temminck, which he regarded erroneously as a distinct species, belonged to this group, as did the Kulm fowl and the Grey Chittagong of the United States. The Malays are of savage disposition. Several smaller breeds of a somewhat similar type are known as Indian Game; some of these, as the Aseels, are of indomitable courage. Until the arrival of the so-called Cochins from the north of China, Malays were the largest fowls known in Europe and were employed to impart size to other varieties by crossing.

Cochins.—This type, which must be regarded as including not only the birds generally so called but also the Brahmas and Langshans, is of very large size, some of the males reaching the great weight of 16 or 17 lb. They are distinguished by a profusion of downy plumage, with small wings and tails; they are incapable of long flight, and the pectoral muscles are consequently but feebly developed. The Cochins originally imported from Shanghai were of several colours; some of the grey birds in America were crossed with the grey Chittagong, the Brahmas being the result of the cross, and they have been long since established as a pure breed, faithfully reproducing their own type. The Langshans are a more recent importation; since their introduction they have been bred by careful selection for eating, and have fuller breasts and less abundant plumage than the older-known Cochins and Brahmas. Recently a sub-variety of Cochins has been raised in America by crossing with a cuckoo-coloured breed long known as Dominiques. These have become fashionable under the name of Plymouth Rocks. They are cuckoo-coloured, viz., each feather is marked with transverse grey stripes on a lighter ground, and, as in all cuckoo-coloured breeds, the cocks are of the same colour as the hens; their legs are not feathered, and the plumage is not so loose as that of the more typical Cochins. They are admirable layers, but the intense yellow of the skin lessens their value for the table.

Spanish.—The Spanish or Mediterranean type is well marked. The birds are of moderate size, with large single erect combs and white ear-lobes. In the black Spanish the whiteness of the ear-lobe extends over the face, and its size has been so greatly developed by cultivation that in some specimens it is 6 or 7 inches in length and several in breadth. Closely related to the Spanish, differing only in colour of plumage and extent of white face and ear-lobe, are the white and brown Leghorns, the slaty-blue Andalusians, the black Minorcas, &c. All are non-incubators, the desire to sit having been lost in the tendency to the increased production of eggs, which has been developed by the persistent and long-continued selection of the most fertile layers.

Hamburghs.—The Hamburghs, erroneously so called from a name given them in the classification adopted at the early Birmingham shows, are chiefly breeds of English origin. They have double combs and small white ear-lobes. There are various sub-varieties. Those with a dark crescent-like mark on the end of each feather of the hen are termed Spangled Hamburghs. Others are of uniform black plumage. A somewhat similar breed of smaller size, with each feather of the hens marked with transverse bands of black on a white or bay ground, is termed Pencilled Hamburghs; they were formerly known as Dutch everyday Layers. These breeds are all non-sitters and lay a remarkably large number of eggs.

Crested Fowls.—The crested breeds have long been culti-

vated on the Continent and are admirably delineated in the pictures by Hondekoeter and other early Dutch artists. In Great Britain they are erroneously termed Polish. The development of the feathered crest is accompanied by a great diminution in the size of the comb, which is sometimes entirely wanting. The wattles also are absent in some breeds, their place being occupied by a large tuft of feathers, forming what is termed the "beard." In all the crested breeds there is a remarkable alteration of the cranium, the anterior part of the skull forming a prominent hollow tuberosity which contains a very large part of the brain. This portion of the brain-case is rarely entirely ossified. There are numerous sub-varieties of crested fowls. The best-known breeds in England are the spangled, with a dark mark at the end of each feather. This mark often assumes a crescent shape, the horns of the crescent sometimes running up each margin of the feather so as to form a black border; feathers so marked are termed "laced" by poultry-fanciers. There are also white Polish and a buff variety. A very distinct sub-variety is the black breed with a white crest on the head and large pendent wattles. A variety with the arrangement of these colours reversed was formerly known, but it has now become extinct. Some of the larger breeds of the west of Europe are closely related to the Polish. The Crève-cœur is a crested breed of uniform black colour; it is of large size and of great value for the table and for egg-production. The Houdan is a black and white breed of very similar character. In some breeds the form of the body and structure of bones of the face closely resemble those of the Polish, but there is an absence of the feathered crest, the crescent-shaped comb becoming more largely developed; such are those known as Guelders, Bredas, and La Flèche, the latter being the best French fowl for eating. A small white-crested variety, profusely feathered on the legs, was received some twenty years since (1864) from Turkey; they are now known as Sultans. The crested breeds are all non-incubating.

Dorkings.—The Dorking type includes fowls that have for many generations been bred for the supply of the London markets. They are all fleshy on the breast and of fine quality. The Dorkings have an extra toe, a monstrosity which leads to disease of the feet. The Surrey and Sussex fowls are four-toed. The coloured Dorkings were greatly increased in size some few years since by crossing with an Indian breed of the Malay type. The birds of the Dorking type are fair layers and good sitters. They are rather delicate in constitution and are chiefly bred in the south of England. Crossed with the Game breed they furnish a hardy fowl, plumper than the Dorking and larger than the Game, which is of unsurpassed excellence for the table. Mating a Dorking cock with large Game hens is found to be the most advantageous.

Silk Fowls.—These constitute a singular variety, in which the barbs of the feathers are not connected by barbules and the entire plumage has a loose fibrous appearance; similar variations are found amongst other species of birds, but are soon lost in a wild state. The silk fowl best known is that in which the plumage is perfectly white, whilst the skin, cellular tissue between the muscles, and the periosteum covering the bones are a deep blue-black, the comb and wattles being a dark leaden blue. The birds are admirable sitters and mothers, and are much valued for rearing pheasants, being of somewhat small size. Though of remarkable appearance when cooked, they are of good quality. In crosses with other breeds the silky character of the plumage is generally lost, but the dark skin and intermuscular cellular tissue remain and greatly lessen the value of the birds in the market.

Frizzled fowls are birds in which each feather curls out-

wards away from the body. They are common in India, but are not adapted to the climate of Britain, as the plumage offers an imperfect protection against wet.

Rumpless fowls are those in which the coccygeal vertebrae are absent; there is consequently no tail. By crossing, rumpless breeds of any variety may be produced. They are not desirable to cultivate, as, from the structural peculiarities, the eggs are very apt to escape being fertilized.

Dumpies or *Creepers* are birds in which the bones of the legs are so short that their progression is considerably interfered with. The best known are the Scotch dumpies.

Long-tailed fowls, under the various names of Yokohama or Phoenix fowls, or Shinotawaro fowls, are singular varieties recently introduced from Japan, in which the sickle-feathers of the tail are 6 or 7 feet long. In Japan they are said to assume a much greater length. One bird in the museum at Tokio is stated to have sickle-feathers 17 feet long; but examination is not permitted. In other respects the fowls are not peculiar, resembling the birds of the Game type.

Bantam.—This term is applied to fowls of a diminutive size without any reference to the particular breed. By careful selection and crossing with small specimens any variety can be reduced to the desired size. The Chinese had in the summer palace at Peking small Cochins weighing not more than 1 lb each. Game bantams of less size have been established during the past twenty-five years. The Malays have been reduced to bantam size within a very few years, as have the crested breeds. The Japanese have long possessed a dwarf breed with enormous tail and comb, and with very short legs. One of the most artificial breeds is the Sebright bantam, named after its originator. This bird has the laced or marginal feather of the Polish combined with the absence of male plumage in the cocks, so that it may be described as a hen-feathered breed with laced plumage. When perfect in marking it is of singular beauty, but is not remarkable for fertility.

In breeding the domestic fowl for useful purposes it is desirable to follow to a greater extent than is usual the natural habits and instincts of the bird. The wild fowl is a resident in forests, coming out to feed in the open; in addition to green vegetables and fruit it lives on grain, seeds, worms, grubs, and insects, which it obtains by scratching in the soil; it roosts in the higher branches of trees, and the hen deposits her eggs on the ground, usually in a concealed situation, laying one egg every other day until the number is completed, when she sits for twenty-one days. On the chickens being hatched they do not leave the nest for twenty-four or thirty hours, being nourished by the absorption of the yolk into the intestinal canal. When they are sufficiently strong to run after the hen she takes them in search of food, which she obtains by scratching in the ground or amongst decaying vegetable matter.

A domesticated hen allowed to make her own nest in a hedge or coppice always brings out a much larger, stronger, and healthier brood than one that sits in the dry close atmosphere of a hen-house. Wherever the nest is placed it should always be made of damp earth so as to supply the requisite moisture and cool the under surface of the eggs as compared with the upper. When hatched the chicken should not be removed for twenty-four hours, feeding not being required. The first food should be egg and milk—equal parts—beaten together and heated until it sets into a soft mass; this may be given with a little canary seed for the first day or two, or millet or wheat; newly-ground sweet oatmeal is good, but pungent rancid meal very injurious. The chickens do much better if the hen is allowed to scratch for them than when she is shut up in a coop. If a coop must be used it should be so constructed as to include a plot of grass and be moved daily. The perches in a hen-house should be on one level, or the fowls fight for the highest. All should be low, so that in flying down the breast-bone and feet may not be injured by coming violently in contact with the ground.

Keeping poultry without an extended range in which they can obtain a large portion of their own food is not desirable, nor has the establishment of poultry-farms, in which large numbers of birds are kept in one locality, ever under any conditions been attended with success. In all cases in which a large number of fowls are congregated together the ground becomes contaminated by the excrement of the birds; the food is eaten off the soiled surface; disease breaks

out amongst the adults; and rearing chickens successfully is out of the question. There are no poultry-farms in France, the eggs and chickens being produced by the peasant-proprietors. In England many poultry-farms have been started, but none have ever proved successful. Poultry-rearing is an industry adapted to the small holder, to the rearer for home consumption, or as an adjunct to the work of a large farm, but as an industry of its own it is never likely to be worked to advantage. There is no difficulty whatever in hatching any number of chickens, but when the young birds are crowded together and are living on tainted soil they invariably become diseased and die with extreme rapidity. The conditions of a crowded poultry-run necessarily resemble those of an army encamped without due sanitary precautions, which cannot be adopted in the case of the birds. The inevitable result is that they perish of diseases of a typhoid character which are quite beyond the power of the owners to control or alleviate.

Turkeys.—The origin of the domesticated turkey is probably of a composite character; by Mr Gould and other naturalists this bird is generally regarded as having been derived from the Mexican species *Meleagris mexicana*; but this has recently been crossed with the North-American *M. gallo-pavo*, with great advantage as to size and hardihood. The varieties of the turkey differ chiefly as to colour. The principal English breeds are the bronze or Cambridgeshire, the black or Norfolk, the fawn, and the white. Of these the first, especially when crossed with the American, is the largest and most desirable.

Turkeys are not so extensively raised in Great Britain as in France, from a prevalent opinion that they are very delicate and difficult to rear; this idea arises in great part from errors in their management and feeding. The chicks, when hatched after twenty-eight days' incubation, should be left undisturbed for twenty-four or thirty hours, during which time they are digesting the yolk that is absorbed into the intestinal canal at birth. No attempt should be made to cram them; their first food should consist of sweet fresh meal, soft custard made with equal parts of egg and milk set by a gentle heat, and, above all, abundance of some bitter milky herb, as dandelion, or, much better, lettuce running to seed, on which they can be reared successfully with very little food of any other description. The young turkeys progress much better if the hen has the range of a small enclosure from the first than if she is confined to a coop; thus reared they are much hardier than when cooped and corn-fed, and not so susceptible to injury from slight showers; but a damp locality should be avoided. Turkey-hens are most persevering sitters, and are employed in France to hatch successions of sittings of hens' eggs. Turkeys can often be most advantageously reared by cottagers, as one or two hens only can be kept, one visit to the male being sufficient to fertilize the entire batch of eggs. The young turkeys find a larger proportion of their own food than fowls, and with a good free range cost but little until they are ready for fattening for the table. In places where the opportunity serves they may be allowed to roost in the trees with great advantage. Some wild flocks treated like pheasants are to be found in several of the large parks in Scotland as well as in England.

Guinea-fowls.—The Common Guinea-fowl (*Numida meleagris*) is a native of eastern Africa, from whence it has been carried to many parts of the world, in some of which, as the West Indian Islands, it has become wild. It has also been reared in a half-wild state in many English preserves; under these conditions it flourishes exceedingly, but has the disadvantage of driving away the pheasants. In any dry locality guinea-fowls may be successfully reared, provided they have a good range and trees in which they can roost. The hen lays an abundance of eggs, which are generally hidden. The birds are useful as furnishing a supply of poultry for the table in the interval that ensues between the time when game are out of season and that before chickens arrive at maturity. On a dry, sandy,

and chalky soil and in a warm situation they are reared with ease, but are quite unsuited to damp cold localities. The continued vociferation of the hen-birds renders their maintenance near a house very objectionable, as the cry is continued throughout great part of the night. Several variations of colour exist, but they do not require any detailed description.

Ducks.—All the varieties of the domesticated duck are descended from the Common Mallard or Wild Duck, *Anas boschas*, a species which, though timid in its wild state, is easily domesticated, and suffers changes of form and colour in a few generations. The most important breeds are—the Rouen, which, retaining the colour of the original species, grows to a large size; the Aylesbury, a large white breed with an expanded lemon-coloured bill; the Pekin, a white breed with a pale yellowish tint in the plumage, and a very bright orange bill; two breeds which are entirely black. The smaller of these, which has been bred down to a very diminutive size, is remarkable for the extreme lustre of its feathers and the fact that its eggs are covered with a dark black pigment, which becomes less in quantity as each successive egg is deposited. It is known by the equally absurd names of East Indian, Labrador, or Buenos Ayres duck. The larger black variety, the Cayuga duck, has been recently introduced into England. Decoy or call ducks are small breeds of a very loquacious character, which were originally bred for the purpose of attracting the wild birds to the decoys. Some are of the natural colour, others are white. Amongst the less known breeds are the Duclair ducks of France, evidently the result of crossing white and coloured varieties. Among the breeds differing in structure may be mentioned the Penguin duck, so called from its erect attitude, the Hook-billed and the Tufted ducks, &c., but these are not of practical importance. For table and market purposes no breed surpasses the Aylesbury; its large size, great prolificacy, early maturity, and white skin and plumage cause it to be reared in immense numbers for the London markets. By good feeding the ducks are caused to lay in the winter months, when the eggs are hatched under Cochin or Brahma hens, the young ducklings being reared in artificially-warmed buildings or in the labourers' cottages; they are fed most liberally on soft food, soaked grits, boiled rice with tallow-melters' greaves, and in ten or twelve weeks are fit for the market; if killed before moulting their quills, which they do when about twelve weeks old, they are heavier than afterwards and much better eating. When ducklings are required for the early spring markets the old birds must be fed most freely to cause the production of eggs in cold weather, corn being given in vessels of water, and the birds must be shut up at night, or the eggs will be laid in the water, where they sink and become putrid. Duck-rearing is a very profitable industry, very high prices being paid for ducklings in the early months of the year. The so-called Muscovy duck is a Brazilian species, *Cairina moschata*, which is not reared for the market, although the young birds are edible. The drake not unfrequently mates with the common duck, and large but sterile hybrids are the result.

Geese.—The domestic goose of Europe is undoubtedly the descendant of the migratory Grey Lag Goose, *Anser cinereus*, from which it differs chiefly by its increased size. Although domesticated since the time of the Romans, it has not been subject to much variation. The most important breeds are the large grey variety known as the Toulouse, the white breed known as the Embden, and the common variety frequently marked with dark feathers on the back, and hence termed "saddlebacks." There has also been introduced from the Crimea since the Russian war a variety in which the feathers are singularly elongated, and even curled and twisted; this breed, which is termed

the Sebastopol, is of small size and more important as a fanciers' breed than from a practical point of view. In some countries a second species is domesticated; it is usually termed the Chinese, knob-fronted, or swan goose, *Anser cygnoides*. Though perfectly distinct as a species, having a different number of vertebræ in the neck and a loud clanging voice, it breeds freely with the common goose, and the hybrids produced are perfectly fertile, the late Mr Blyth asserting that over a large tract of country in the East no other geese except these cross-breeds are ever seen. Geese are much more exclusively vegetable-feeders than ducks, and can only be kept to profit where they can obtain a large proportion of their food by grazing. The old birds should not be killed off, as they continue fertile to a great age. Geese are readily fattened on oats thrown into water, and the young, when brought rapidly forward for the markets, afford a very good profit. The Chinese, if well fed, lay at a much earlier date than the common species, and, if their eggs are hatched under large Cochin hens, giving three or four to each bird, the young are ready for the table at a very early period. The nest, as in all cases of ground-nesting birds, should be made on the earth and not in boxes, which become too dry and over-heated. In breeding for the market or for the sake of profit, the very large exhibition birds should be avoided, as many are barren from over-fatness, and none are so prolific as birds of fair average size.

In this article the Pea-fowl (see PEACOCK, vol. xviii. p. 443) has not been included, as, although long since domesticated, it is to be regarded rather as an ornamental than as a useful bird, and in congenial localities in which it can avail itself of the shelter of trees it requires no management whatever beyond feeding, nor should the slightest interference with the sitting hen be practised.

Pigeons.—All the different breeds of pigeons which are known to the fancier have descended from the wild blue Rock-dove, *Columba livia*, and return to the coloration and form of the wild original if allowed to interbreed without interference. When reared as articles of food pigeons are generally treated most disadvantageously; with due care and proper management six or seven couples of young can be raised from each old pair during the year, and a continuous supply of young birds for the table can be depended on. The ordinary pigeons' houses are most objectionable, the birds being exposed to rain and extremes of temperature at all seasons. To be reared successfully pigeons should be housed in a room or loft, with shelves 9 or 10 inches in width running round the walls about 10 inches apart; each shelf should be divided into compartments not less than 16 inches long; this arrangement gives room for a nest at each end and enables the old birds to go to nest again before the young are able to fly. If coarse earthen saucers or nest-pans are used the young will be kept out of the dung, which is ejected over the sides and can be easily removed. They are first fed with a secretion from the crops of the parents, and afterwards with disgorged corn; when required for the table they should be killed before the old birds cease to feed them, as when they begin to feed themselves they lose weight, become thin, and are much less marketable. To obtain a continuous supply of young pigeons the old birds must be well fed with grain and pulse; clean water and a supply of old mortar rubbish mixed with salt should be always accessible; the loft and nest should be kept clean and well ventilated, and the birds have free access to the open air. The breed should be of fair size, the blue rocks being too small to be of full market value as dead birds, though in great request for pigeon-shooting, and, unless a considerable number are kept so as to prevent close interbreeding, some birds from other lofts should be introduced occasion-

ally. The numerous fancy breeds and those employed for conveying messages (see vol. xiii. p. 159 and p. 581 *supra*) do not fall within the scope of this article. (w. B. T.)

POUND, an enclosure in which cattle or other animals found straying are retained until they are redeemed by the owners, or when taken in distraint until replevined, such retention being in the nature of a pledge or security to compel the performance of satisfaction for debt or damage done. A pound belongs to the township or village and should be kept in repair by the parish. The pound-keeper is obliged to receive everything offered to his custody and is not answerable if the thing offered be illegally impounded. By the statute 1 and 2 Phil. and Mary c. 12 (1554), no distress of cattle can be driven out of the hundred where taken unless to a pound within 3 miles of the place of seizure. Where cattle are impounded the impounder is bound to supply them with sufficient food and water (12 and 13 Vict. c. 92, and 17 and 18 Vict. c. 60); any person, moreover, is authorized to enter a place where animals are impounded without food and water more than twelve hours and supply them without being liable to an action for such entry, and the cost of such food is to be paid by the owner of the animal before it is removed. The statute 2 Will. and Mary, sess. 1 c. 5 (1690), gives treble damages and costs against persons guilty of *pound breach*; and by 6 and 7 Vict. c. 30 (1843) persons releasing or attempting to release cattle impounded or damaging any pound are liable to a fine not exceeding £5, awardable to the person on whose behalf the cattle were distrained, with imprisonment with hard labour not exceeding three months in default. In the old law books a distinction is drawn between a common pound, an open pound, and a close pound; these terms have now, however, lost much of, if not all, their significance. By statute 11 Geo. II. c. 19 (1738), which was passed for the benefit of landlords, any person distraining for rent may turn any part of the premises upon which a distress is taken into a pound *pro hac vice* for securing of such distress.

POUSHKIN, ALEXANDER (1799-1837), the most celebrated of Russian poets, was born at Moscow, 7th June 1799. He belonged to an ancient family of boyars, and in a clever poem, many of the sallies of which were too trenchant to pass the censorship, he has sketched some of the more important of his progenitors. A strange ancestor was his maternal great-grandfather, a favourite Negro ennobled by Peter the Great, who bequeathed to him the curly hair of his race and a somewhat darker complexion than falls to the lot of the ordinary Russian.

In 1811 the poet entered the newly-founded lyceum of Tzarskoe Selo, situated near St Petersburg. To his stay in this college Poushkin has alluded in many of his poems. On quitting the lyceum in 1817 he was attached to the ministry of foreign affairs, and in this year he began the composition of his *Ruslan and Lyudmila*, a poem which was completed in 1820. The scene is laid at Kieff, in the time of Vladimir, the "bright sun" of the old Russian legends. Meanwhile Poushkin mixed in all the gayest society of the capital, and it seemed as if he would turn out a mere man of fashion instead of a poet. But an event occurred which, however disastrous it might appear to him at first sight, was fraught with the happiest consequences to his muse. A very daring *Ode to Liberty* written by him had been circulated in manuscript in St Petersburg. This production having been brought to the notice of the governor, the young author only escaped a journey to Siberia by accepting an official position at Kishineff in Bessarabia, in southern Russia. Here he found himself surrounded by a world of new associations. If we follow the chronological order of his poems, we can trace with what enthusiasm he greeted the ever-changing prospects

of the sea and the regions of the Danube and the Crimea. In some elegant lines he sang the *Fountain of Bakhchisarai*, the old palace of the khans near Simpheropol. This fountain and the legend connected with it he afterwards made the subject of a longer poem.

At this time Poushkin was, or affected to be, overpowered by the Byronic "Weltschmerz." Having visited the baths of the Caucasus for the re-establishment of his health in 1822, he felt the inspiration of its magnificent scenery, and composed his next production of any considerable length, *The Prisoner of the Caucasus*, narrating the story of the love of a Circassian girl for a youthful Russian officer who has been taken prisoner. This was followed by the *Fountain of Bakhchisarai*, which tells of the detention of a young Polish captive, a Countess Potocka, in the palace of the khans of the Crimea. About the same time he composed some interesting lines on Ovid, whose place of banishment, Tomi, was not far distant. To this period belongs also the *Ode to Napoleon*, which is far inferior to the fine poems of Byron and Manzoni, or indeed of Lermontoff, on the same subject. In the *Lay concerning the Wise Oleg* we see how the influence of Karamzin's *History* had led the Russians to take a greater interest in the early records of their country. The next long poem was the *Gipsies* (Tzuigani), an Oriental tale of love and vengeance, in which Poushkin has admirably delineated these nomads, whose strange mode of life fascinated him. During his stay in southern Russia he allowed himself to get mixed up with the secret societies then rife throughout the country. He also became embroiled with his chief, Count Vorontzoff, who sent him to report upon the damages which had been committed by locusts in the southern part of Bessarabia. Poushkin took this as a premeditated insult, and sent in his resignation; and Count Vorontzoff in his official report requested the Government to remove the poet, "as he was surrounded by a society of political and literary fanatics, whose praises might turn his head and make him believe that he was a great writer, whereas he was only a feeble imitator of Lord Byron, an original not much to be commended." The poet quitted Odessa in 1824, and on leaving wrote a fine *Ode to the Sea*. Before the close of the year he had returned to his father's seat at Mikhailovskoe, near Pskoff, where he soon became embroiled with his relatives, but grew more at ease when the veteran, who led the life of reckless expenditure of the old-fashioned Russian boyar, betook himself to the capital. The father survived his celebrated son, and it was to him that Zhukovski addressed a pathetic letter, giving him an account of his death. His mother died a year before her son; and Poushkin, when choosing a burial-place for her, marked out a spot for himself and expressed a presentiment that he had not long to live. He had now involved himself in trouble on all sides; for so obnoxious had he become to the authorities even during his retreat in the country that he was put under the supervision of the governor, the marshal of the nobility, and the archimandrite of the neighbouring monastery of Svyatogorski. In his retirement he devoted a great deal of time to the study of the old Russian popular poetry, the *builinas*, of which he became a great admirer. Recollections of Byron and André Chenier gave the inspiration to some fine lines consecrated to the latter, in which Poushkin appeared more conservative than was his wont, and wrote in a spirit antagonistic to the French Revolution. In 1825 he published his tragedy *Boris Godunoff*, a bold effort to imitate the style of Shakespeare. Up to this time the traditions of the Russian stage, such as it was, had been French. Plays of all kinds had appeared,—translations of Molière, Corneille, and Racine, or adaptations of them, and even glimpses of Shakespeare conveyed through the medium of the paltry versions of Ducis.

In 1825 the unfortunate conspiracy of the Dekabrists broke out, the ostensible aim of which was to defend the claims of the grand-duke Constantine against his brother Nicholas, but the real purpose was to set up a republican form of government in Russia, for which the country was not by any means prepared. Many of the conspirators were personal friends of Poushkin, especially Küchelbecker and Pustchin. The poet himself was to a certain extent compromised, but he succeeded in getting to his house at Mikhailovskoe and burning all the papers which might have been prejudicial to him. He had resolved to go to St Petersburg, possibly to throw in his lot with his friends there, but was stopped by what are considered portents by the Russian people. As soon as he had left the gates of his house he met a priest, and he had not gone a verst before three hares crossed his path. These were such bad omens that there was nothing for him to do, as a genuine Russian and at all times a superstitious man, but to return home at once. Through influential friends he succeeded in making his peace with the emperor, to whom he was presented at Moscow soon after his coronation. The story goes that Nicholas said to Count Bludoff on the same evening, "I have just been conversing with the most witty man in Russia." In 1828 appeared *Poltava*, a spirited narrative poem, in which the expedition of Charles XII. against Peter and the treachery of the hetman Mazeppa were described. The best part of the poem is the picture of the battle itself, where the colours are laid on very boldly. In 1829 Poushkin again visited the Caucasus, on this occasion accompanying the expedition of Prince Paskewitch. He wrote a pleasing account of the tour; many of the short lyrical pieces suggested by the scenery and associations of his visit are delightful, especially the lines on the Don and the Caucasus. In 1831 Poushkin married Mademoiselle Natalia Goncharoff, and in the following year was again attached to the ministry of foreign affairs, with a salary of 5000 roubles. He now busied himself with an historical work, an account of the revolt of the Cossack Pugacheff, who almost overthrew the empire of Catherine and was executed at Moscow in the latter part of the 18th century. While engaged upon this he wrote *The Captain's Daughter*, one of the best of his prose works. In 1832 was completed the poem *Eugene Onyegin*, in which the author attempted a completely new style, moulding his production upon the lighter sketches of Byron in the Italian manner. The poem is, on the whole, very successful. The metre is graceful and sprightly and well adapted for serio-comic verse. The characters of Lenski, Onyegin, Tatiana, and Olga are drawn with a vigorous hand, and each is a type. No one can accuse Poushkin of want of nationalism in this poem: it is Russian in every fibre.

In 1837 the poet, who had been long growing in literary reputation, fell mortally wounded in a duel with Baron George Heckeren d'Anthès, the adopted son of the Dutch minister then resident at the court of St Petersburg. D'Anthès, a vain and frivolous young man, had married a sister of the poet's wife. Notwithstanding this he aroused Poushkin's jealousy by some attentions which he paid Natalia; but the grounds for the poet's anger, it must be confessed, do not appear very great. Poushkin died, after two days' suffering, on the afternoon of Friday, 10th February. D'Anthès was tried by court-martial and expelled the country. In the year 1880 a statue of the poet was erected at the Tver Barrier at Moscow, and fêtes were held in his honour, on which occasion many interesting memorials of him were exhibited to his admiring countrymen and a few foreigners who had congregated for the festivities. The poet left four children; his widow was afterwards married to an officer in the army named Lanskoï; she died in 1863.

Poushkin remains as yet the greatest poet whom Russia has produced. The most celebrated names before him were those of Lomonosoff and Derzhavin; the former was a composer of merely scholastic verses, and the latter, in spite of great merits, was too much wedded to the pedantries of the classical school. Since Poushkin's death, Lermontoff and Nekrasoff have appeared, both distinctly writers of genius, but they are confessedly inferior to him. His poetical tales are spirited and full of dramatic power. The influence of Byron is undoubtedly seen in them, but they are not imitations, still less is anything in them plagiarized. *Boris Godunoff* is a fine tragedy; on the whole *Eugene Onyegin* must be considered Poushkin's masterpiece. Here we have a great variety of styles—satire, pathos, and humour mixed together. The character-painting is good, and the descriptions of scenery introduced faithful to nature. The poem in many places reminds us of Byron, who himself in his mixture of the pathetic and the humorous was a disciple of the Italian school. Poushkin also wrote a great many lyrical pieces. Interspersed among the poet's minor works will be found many epigrams, but some of the best composed by him were not so fortunate as to pass the censorship, and must be read in a supplementary volume published at Berlin. As a prose writer Poushkin has considerable merits. Besides his *History of the Revolt of Pugacheff*, which is perhaps too much of a compilation, he published a small volume of tales under the *nom de plume* of Ivan Byelkin. These all show considerable dramatic power; the best are *The Captain's Daughter*, a tale of the times of Catherine II., *The Undertaker*, a very ghostly story, which will remind the English reader of some of the tales of Edgar Poe; *The Pistol Shot*; and *The Queen of Spades*. Of the letters of Poushkin, which originally were to be found scattered over many magazines and literary journals, a fairly complete collection was published in the new edition of his works which appeared at Moscow under the editorship of M. Yefrimoff. (W. R. M.)

POUSSIN, NICOLAS (1594-1665), French painter, was born at Les Andelys (Eure) in June 1594. Early sketches, made when he should have been learning Latin, attracted the notice of Quentin Varin, a local painter, whose pupil Poussin became, till he went to Paris, where he entered the studio of Ferdinand Elle, a Fleming, and then of the Lorrainer L'Allemand. He found French art in a stage of transition: the old apprenticeship system was disturbed, and the academical schools destined to supplant it were not yet established; but, having been brought into relations with Courtois the mathematician, Poussin was fired by the study of his collection of engravings after Italian masters, and resolved to go to Italy. After two abortive attempts to reach Rome, and when he was again on the road, he fell in with the chevalier Marini at Lyons. Marini employed him on illustrations to his poems, took him into his household, and in 1624 enabled Poussin (who had been detained by commissions in Lyons and Paris) to rejoin him at Rome. There, his patron having died, Poussin fell into great distress; but his high qualities had won him friends amongst his brother artists, and on his falling ill he was received into the house of his compatriot Duguet and tenderly nursed by his daughter Anna Maria, to whom in 1629, when his affairs were easier, Poussin was married. Amongst his first patrons were Cardinal Barberini, for whom was painted the Death of Germanicus (Barberini Palace); Cardinal Omodei, for whom he produced, in 1630, the Triumphs of Flora (Louvre); Cardinal de Richelieu, who commissioned a Bacchanal (Louvre); Vincenzo Giustiniani, for whom was executed the Massacre of the Innocents, of which there is a first sketch in the British Museum; Cassiano dal Pozzo, who became the owner of the first series of the Seven Sacraments (Belvoir Castle); and Fiéart de Chanteloup, with whom in 1640 Poussin, at the call of Sublet De Noyers, returned to France. He was well received by Louis XIII., who conferred on him the title of "first painter in ordinary," and in two years at Paris he produced not only several pictures for the royal chapels (the Last Supper, painted for Versailles, now in the Louvre) but eight cartoons for the Gobelins, the series of the Labours of Hercules for the Louvre, the Triumph of Truth for Cardinal Richelieu (Louvre), and much minor work; but in 1643, annoyed and disgusted

by the intrigues of Simon Vouët, Feuquières, and the architect Lemerrier, Poussin withdrew to Rome. There, in 1648, he finished for De Chanteloup the second series of the Seven Sacraments (Bridgewater Gallery), and also his noble landscape with Diogenes throwing away his Scoop (Louvre); in 1649 he painted the Vision of St Paul (Louvre) for the comic poet Scarron, and in 1651 the Holy Family (Louvre) for the duke of Créqui. Year by year he continued to produce an enormous variety of works, many of which are included in the list given by Félibien, in which we find the names of Pointel the banker, Cardinal Manimò, Madame Mauroi, and others. He is said to have settled in a house on the Pincio, but in 1656, the year of the plague, he is entered in the census as living with his wife in the Via Paolina. He died in November 1665 and was buried in the church of St Lawrence in Lucina, his wife having predeceased him.

The finest collection of Poussin's paintings as well as of his drawings is possessed by the Louvre; but, besides the pictures in the National Gallery and at Dulwich, England possesses several of his most considerable works: the Triumph of Pan is at Basildon (Berkshire), and his great allegorical painting of the Arts at Knowsley. At Rome, in the Colonna and Valentini Palaces, are notable works by him, and one of the private apartments of Prince Doria is decorated by a great series of landscapes in distemper, which are little known. Throughout his life he stood aloof from the popular movement of his native school. French art in his day was purely decorative, but in Poussin we find a survival of the impulses of the Renaissance coupled with conscious reference to classic work as the standard of excellence. In general we see his paintings at a great disadvantage, for the colour, even of the best preserved, has changed in parts, so that the keeping is disturbed; and the noble construction of his designs can be better seen in engravings than in the original. Amongst the many who have reproduced his works the two Audran, Claudine Stella, Picart, and Pesne are the most successful.

Poussin left no children, but he adopted as his son Gaspar Dughet, his wife's brother, who took the name of Poussin. GASPARD POUSSIN (1613-1675) devoted himself to landscape painting and rendered admirably the severer beauties of the Roman Campagna; a noteworthy series of works in tempera representing various sites near Rome is to be seen in the Colonna Palace, but one of his finest easel-pictures, the Sacrifice of Abraham, formerly the property of the Colonna, is now, with other works by the same painter, in the English National Gallery. The frescos executed by Gaspar Poussin in S. Martino di Monti are in a bad state of preservation. The Louvre does not possess a single work by his hand. Gaspar died at Rome in 1675.

S. Pattison, "Documents inédits, Le Poussin," in *L'Art* (1882).

POUT, also WHITING-POUT or BIB (*Gadus luscus*), a small species of cod-fish locally abundant on the coasts of northern and western Europe, but less so in the Mediterranean. It is distinguished from other species of the genus *Gadus* by having a deep short body; a short and obtuse snout, not longer than the eye; the upper jaw the longer; and a long barbel at the chin. The three dorsal fins are composed of respectively twelve, twenty or twenty-two, and nineteen or twenty rays, the two anal fins of from twenty-nine to thirty-two and nineteen or twenty. A black spot occupies the upper part of the base of the pectoral fin. Pout affect certain localities of limited extent, where a number may be caught with hook and line. They are excellent food, but must be eaten soon after capture, and do not bear carriage. A pout of 5 lb is considered a very large specimen.

POWAN, or POWEN (*Coregonus clupeoides*), a species of the Salmonoid genus *Coregonus*, which seems to be peculiar to Loch Lomond in Scotland, the great lakes of Cumberland, where it is called "schelly," and Lake Bala in Wales, the Welsh name of the fish being "gwyniad." It is not found in other European waters; but of the numerous Continental species of this genus the lavaret of the Swiss lakes resembles it most. Powan, or, as they are sometimes called, freshwater herrings, live in the deepest parts of the

lakes mentioned and come to the surface only occasionally, either in the winter time in order to spawn, or at certain times of the day during summer, approaching, it is said, the shores in search of food. Large numbers may then be taken with nets, and are mostly consumed on the spot. The powan rarely exceeds a length of 14 inches; it has been fully described and figured by Parnell (*Annals of Natural History*, 1838, vol. i. p. 162) under the names of *Coregonus lacepedei* and *Coregonus microcephalus*; the specimens to which the latter name was given are, however, not specifically different from the typical powan.

POWERS, HIRAM (1807-1873), American sculptor, was the son of a farmer, and was born at Woodstock, Vermont, on 29th June 1807. In 1819 his father removed to a farm in Ohio, about six miles from Cincinnati, where the son attended school for about a year, staying meanwhile with his brother, a lawyer in Cincinnati. After leaving school he found employment in superintending a reading-room in connexion with the chief hotel of the town, but, being, in his own words, "forced at last to leave that place as his clothes and shoes were fast leaving him," he became a clerk in a general store. His second employer in this line of business having invested his capital in a clock and organ factory, Powers set himself to master the construction of the instruments, displaying an aptitude which in a short time enabled him to become the first mechanic in the factory. In 1826 he began to frequent the studio of Mr Eckstein, and at once conceived a strong passion for the art of sculpture. His proficiency in modelling secured him the situation of general assistant and artist of the Western Museum, kept by a Frenchman, M. Dorfeuille, where his ingenious representation of the infernal regions to illustrate the more striking scenes in the poem of Dante met with extraordinary success. After studying thoroughly the art of modelling and casting, he in the end of 1834 went to Washington, and a friend having secured for him as sitters the president and some of the leading statesmen his remarkable gifts soon awakened general attention. In 1837 he settled in Florence, where he remained till his death. While from pecuniary considerations he found it necessary to devote the greater part of his time to busts, his best efforts were bestowed on ideal work. In 1838 his statue of Eve excited the warm admiration of Thorwaldsen, and in 1839 he produced his celebrated Greek Slave, which at once gave him a place among the greatest sculptors of his time. Among the best known of his other ideal statues are the Fisher Boy, Il Penseroso, Proserpine, California, America (modelled for the Crystal Palace, Sydenham), and the Last of his Tribe. Among the eminent men whose busts he modelled are many of the leading contemporary statesmen of America. His genius was strikingly realistic and unconventional, a quality doubtless in some degree attributable to the nature of his early training, but it was the close and thorough study of the works of the great masters which finally disciplined his powers to their highest perfection of purity and refinement. He died on 27th June 1873.

Among various obituary notices of Powers one of the most interesting is that by his intimate friend T. A. Trollope in *Lippincott's Magazine* for February 1875.

POZZO DI BORGO, CARLO ANDREA (1764-1842), Russian diplomatist, was descended from an old Corsican family, and was born at Alata near Ajaccio on 8th March 1764. After completing his legal studies at Pisa he became advocate at Ajaccio, where in 1790 he joined the party of Paoli, to whom the Buonaparte family was strongly opposed. In his early years he had been on terms of the closest intimacy with Napoleon, but from this time a feeling of enmity sprang up between them, which on the part of Pozzo di Borgo increased as the career of Napoleon

developed, until it became the ruling passion of his life. Ultimately his hatred of Napoleon knew no bounds, and, regarding him as the "scourge of the world," he sought to compass his ruin with a pertinacity which discouragements and difficulties served only to whet and kindle into redoubled ardour. In 1794 he was chosen president of the Board of Council, under the English viceroy, and when the British were expelled from the island in 1797 he went to London, where he carried on a secret mission on behalf of the Bourbons. At Vienna in 1798 he assisted in effecting a coalition between Austria and Russia against France, and in 1803 he entered the Russian service, where he became councillor of state, and was employed by the czar in all his most important diplomatic negotiations. He attempted in vain to form a new coalition after the battle of Jena, and retired, first to Austria, then to England. Recalled to Russia in 1812, he exerted all his influence to urge a continuance of the war with France till the power of Napoleon should be broken. In addition to this he secured the alliance of the Swedish crown prince Bernadotte, and also went to London to secure the active co-operation of England. He it was who counselled the allies to bring matters to a crisis by marching on Paris, and it was he who penned the famous declaration that they waged war against Napoleon, not against the French people. He gave warning to the congress of Vienna of the possibility of Napoleon returning from Elba, was present at the battle of Waterloo, where the power of Napoleon was finally crushed, and on 20th November 1815 enjoyed the supreme satisfaction of signing the treaty of Paris as Russian ambassador. In 1826 he was appointed to represent Russia at Paris. He retired from public life in 1835, and died at Paris on 15th February 1842.

Stein et Pozzo di Borgo, 1846, English trans., 1847; Vuhner, *Notice biographique sur le Comte Pozzo di Borgo*, 1842.

POZZUOLI, the ancient PUTEOLI, a city of Italy, on the northern shore of the Bay of Pozzuoli (Sinus Puteolanus or Cumanus),—the western portion of the Gulf of Naples, separated from the larger eastern portion by the promontory of Posillipo and from the open sea on the west by the peninsula which terminates in Cape Miseno. It is a place of 11,967 inhabitants (1881) and the centre of a commune, which, including Bacoli (3130; the ancient Bauli) and Nisida (1202), numbers 17,269. Its small flat-roofed houses cluster picturesquely on a tongue of land projecting south-west into the bay. The cathedral of St Proculus occupies the site of a temple erected to Augustus by L. Calpurnius and contains the tomb of Pergolesi. The harbour is still visited by 500 or 600 sailing vessels in the course of the year. But the true riches of Pozzuoli are its ruins. First in point of interest is the Serapeum or temple of Serapis. This consisted of a rectangular court enclosed by forty-eight massive columns and having in the centre a round temple with sixteen Corinthian pillars of African marble. The three great columns of the portico, about 40 feet high, still stand. The perforations of a boring mollusc show that they must for a time have been submerged 13 feet in the sea. The new upheaval of the ground appears to have begun before 1530 and to have been hastened by the great Monte Nuovo eruption of 1538. A gradual subsidence has again been observed since the beginning of the 19th century. The pillars of the round temple are now in Caserta, and the statue of Serapis is in the National Museum at Naples. The amphitheatre (482 feet long by 383 broad), erected in the time of the Flavian dynasty on the hill behind the town, was seated for 30,000 spectators, and had an arena 286 feet long and 138 feet broad. Among the populace the building is known as the Prison of St Januarius, because, according to the legend, that saint and his com-

panions were here condemned to fight with wild beasts. At an earlier date it had been the scene of the spectacle in which Nero, in presence of King Tiridates of Armenia, displayed his personal prowess. To the west of the Serapeum lie traces of various minor ruins, a temple of Neptune, &c., and especially the site of Cicero's villa (Puteolanum or Academia), which was afterwards occupied by a temple in honour of the emperor Hadrian. The whole neighbourhood has proved rich in epigraphic remains.

Puteoli first appears under the name of Dicearchia as a port of the people of Cumæ. The statement made by Stephanus of Byzantium and Eusebius, that the city was founded by a colony of Samians, probably refers to some secondary accession of population from that quarter. The Romans in 215 B.C. introduced a garrison of 6000 men to protect the town from Hannibal; and in 194 B.C. a Roman colony was established. In the Civil War the citizens sided first with Pompey and afterwards with Brutus and Cassius. Augustus strengthened the colony with a body of his veterans (hence *Colonia Augusta*), and Nero admitted the old inhabitants into it. The remains of Hadrian, who died at the neighbouring town of Baiæ, were burned at Puteoli, and Antoninus Pius, besides erecting the temple to his memory already mentioned, instituted sacred games to be held in the city every five years. It was mainly, however, as a great commercial port that Puteoli was famous in ancient times. It was one of the two places in Italy (Rome was the other) where the Tyrian merchants had a regular trading station; it trafficked with Syria (merchants from Berytus are mentioned among its residents), Egypt, Africa, and Spain, and spices from the East, corn from Alexandria, iron from Populonium were stored in its warehouses. Like Ostia, Puteoli was considered a special port of Rome, and, on account of the great safety and convenience of its harbour, it was preferred to Ostia for the landing of the more costly and delicate wares. Like Ostia, consequently, it was treated as practically part of Rome, and with it enjoyed the peculiar distinction of being enrolled in the Palatine tribe. The artificial mole was probably of earlier date than the reign of Augustus; and by that time there were docks large enough to contain the vessels employed in bringing the obelisks from Egypt. Remains of the piles of the mole still exist, and are popularly known as Caligula's Bridge, from the mistaken idea that they belong to the temporary structure which that emperor flung across the bay from the mole at Puteoli to the shore at Baiæ. Alaric (410), Genserik (455), and Totila (545) successively laid Puteoli in ruins. The restoration effected by the Byzantines was partial and short-lived. Sacked by Grimoald of Beneventum in 715, harassed by the Saracens in the 10th century, captured by John duke of Naples in 1014, and again sacked by the Turks in 1550, the city could hardly have continued prosperous even apart from the earthquakes of 1198 and 1538.

Works on Puteoli have been written by Mazzella (1594), Capaccio (1604), Sarnellius (1691), Parrino (1709), Jorio (1817 and 1830). See the bibliography in *Corp. Inscr. Lat.*, vol. x. part i. pp. 182, 317.

PRADIER, JAMES, French sculptor, was born at Geneva in 1790 and died in Paris on 5th June 1852. He was a member of the Academy and a brilliant and popular sculptor of the pre-Romantic period, representing in France the drawing-room classicism which Canova illustrated at Rome. His chief works are the Son of Niobe, Atalanta, Psyche, Sappho (all in the Louvre), Prometheus (Tuileries Gardens), a bas-relief on the triumphal arch of the Carrousel, the figures of Fame on the Arc de l'Étoile, and a statue of J. J. Rousseau for Geneva.

See *Magazin pittoresque*, iii., vi., and xi.; Barbet de Jouy, *Sculptures modernes du Louvre*.

PRAED, WINTHROP MACKWORTH (1802-1839), one of the most illustrious English writers of *vers de société*, was the third and youngest son of William Mackworth Praed, serjeant at law. The name of his father's family had been originally Mackworth, and the circumstances under which the additional title of Praed was adopted are set out in the *Parochial History of Cornwall* (iii. 101). Winthrop, a cognomen famous across the Atlantic as borne by the governor of Massachusetts, was his mother's maiden name, and the union of these three consonantal names in the person of Winthrop Mackworth Praed formed the combination over which Miss Mitford expressed righteous indignation. He was born at 35 John Street, Bedford Row, London, 26th July 1802, and almost as soon as he could read was taught by his father to "lisp in numbers." His

mother died in 1809, whereupon the child was sent to the preparatory school of Langley Broom near Colnbrook, where he remained until he was removed (28th March 1814) to Eton. Towards the close of his schoolboy days he started a manuscript periodical called *Apis Matina*. This was succeeded in October 1820 by the *Etonian*, a paper projected and edited by Praed and Walter Blunt, which appeared every month until July 1821, when the chief editor left the "glade" of Eton and the paper died. Henry Nelson Coleridge, William Sidney Walker, and John Moultrie were the three best known of his coadjutors in this periodical, which was published by Charles Knight, and of which many interesting particulars are set out in Knight's *Autobiography* and in Maxwell Lyte's *Eton College*. Before Praed left school he succeeded in establishing over a shop at Eton a "boy's library" for the use of the higher Etonians, the books of which are now amalgamated in the official "boy's library" in the new buildings. His career at Cambridge, where he matriculated at Trinity College, October 1821, was marked by exceptional brilliancy. Thrice he gained the Browne medal and twice the chancellor's medal for English verse. He was bracketed third in the classical tripos in 1825, won a fellowship at his college in 1827, and three years later carried off the Seatonian prizes. At the Union his speeches attracted the admiration of his fellow-undergraduates; he struggled, and not unequally, with Macaulay and Austin. The character of Praed during his university life is described by Bulwer Lytton in the first volume of his *Life* (pp. 227-239, 244-246). At Cambridge, as at Eton, the poet was drawn by Charles Knight into the pleasures of magazine-writing. *Knight's Quarterly Magazine* was started in 1822 with Praed as one of the principal contributors, and, after languishing for some time, it expired when three octavo volumes had been issued. For two years (1825-27) he resided at Eton as private tutor to Lord Ernest Bruce, a younger son of the marquis of Ailesbury. During part of this time he was occupied in preparing himself for the profession of the law, and on 29th May 1829 he was called to the bar at the Middle Temple. He travelled on the Norfolk circuit, where his prospects of advancement were bright, but the bias of his feelings inclined him towards politics, and after a year or two he devoted himself entirely to political life. Whilst at Cambridge he leaned to Whiggism, and even to the autumn of 1829 his feelings were bent towards the same side, but with the dawning of the Reform Bill he passed into the opposite ranks, and when he was returned to parliament for St Germans (17th December 1830) his election was due to the kindness of Mr Herries, a zealous member of the Tory party. He sat for that borough until December 1832, and on its extinction contested the borough of St Ives, within the limits of which the Cornish estates of the Praeds are situated. The squibs which he wrote on this occasion were collected in a volume printed at Penzance in 1833 and entitled *Trash, dedicated without respect to James Halse, Esq. M.P.*, his successful competitor. Praed subsequently sat for Great Yarmouth from 1835 to 1837 and for Aylesbury from the latter year until his death. During the progress of the Reform Bill he advocated the creation of three-cornered constituencies, in which each voter should have the power of giving two votes only, and maintained that freeholds within boroughs should confer votes for the boroughs and not for the county. Neither of these suggestions was then adopted, but the former ultimately formed part of the Reform Bill of 1866. Praed was for a few months (December 1834 to April 1835) secretary to the Board of Control, and he was much gratified at receiving the appointment of deputy high steward of his beloved university of Cambridge. The last years of his life were racked by the pains of phthisis, though

all that sympathy and devotion could effect to alleviate his sufferings was accomplished by his wife, Helen, daughter of Mr George Bogle, whom he had married in 1835. He died at Chester Square, London, on 15th July 1839, and was buried at Kensal Green on 23d July.

Praed's lighter poetry was the perfection of ease. It abounded in allusions to the characters and follies of the day and passed with playful touch from puns to politics. In his humorous effusions he was the chief of a school which in these latter days has found numerous imitators. Many of his poems were marked by much pathetic feeling, for his talents were by no means limited to puns and jests. Several American issues of his works appeared before the comprehensive English edition of his *Poems*, "with a memoir by Rev. Derwent Coleridge," was published in 1864. At a later date a selection from his poems by Sir George Young was given to the world.

PRÆFECT (*præfectus*) was the title of various Roman officials, both civil and military. A præfect was not one of the magistrates proper; he was, strictly speaking, only the deputy or lieutenant of a superior magistrate or commander. The following were the most important classes of præfects.

1. The city præfect (*præfectus urbi*) acted at Rome as the deputy of the chief magistrate or magistrates during his or their absence from the city. Thus he represented in the earliest times the king and in later times the consul or consuls when he or they were absent on a campaign or on other public duties, such as the celebration of the annual Latin festival on the Alban Mount. The absence of the chief magistrate for more than a single day rendered the appointment of a præfect obligatory; but the obligation only arose when *all* the higher magistrates were absent. Hence so long as the consuls were the only higher magistrates their frequent absence often rendered the appointment of a præfect necessary, but after the institution of the prætorship (367 B.C.) the necessity only arose exceptionally, as it rarely happened that both the consuls and the prætor were absent simultaneously. But a præfect continued to be regularly appointed, even under the empire, during the enforced absence of all the higher magistrates at the Latin festival. The right and duty of appointing a præfect belonged to the magistrate (king, dictator, or consul) whose deputy he was, but it seems to have been withdrawn from the consuls by the Licinian law (367 B.C.), except that they still nominated præfects for the time of the festival. No formalities in the appointment and no legal qualifications on the part of the præfect were required. The præfect had all the powers of the magistrate whose deputy he was, except that he could not nominate a deputy to himself. His office expired on the return of his superior. There could only be one city præfect at a time, though the dictator Cæsar broke the rule by appointing six or eight præfects simultaneously.

Under the empire there was introduced a city prefecture which differed essentially from the above. Augustus occasionally appointed a city præfect to represent him in his absence from Italy, although the prætors or even one of the consuls remained in the capital. In the absence of Tiberius from Rome during the last eleven years of his reign (26-37 A.D.) the city prefecture, hitherto an exceptional and temporary office, became a regular and permanent magistracy; in all subsequent reigns the præfect held office even during the presence of the emperor in Rome. He was always chosen by the emperor and usually from men who had held the consulship; his office was regarded, like the censorship under the republic, as the crowning honour of a long political career. It was not conferred for any definite length of time, but might be held for years or for life. As under the republic, the præfect was not allowed to quit the city for more than a day at a time. His duty was the preservation of peace in the capital; he was, in fact, the chief of the police, being charged with the super-

intendence of the streets, markets, and public buildings. He was further entrusted by Augustus with a summary criminal jurisdiction over slaves and rioters, which was, however, gradually extended till in the time of Severus or even earlier it embraced all offences by whomsoever committed. Further, he had the power of dealing with civil cases where his interference seemed requisite in the interests of the public safety, but such occasions were naturally few. By the beginning of the 3d century, and perhaps earlier, appeals to the emperor in civil cases were handed over by him to be dealt with by the præfect. Except where special restrictions interfered, an appeal lay from the præfect to the emperor. Though not a military officer, the præfect commanded the city cohorts (*cohortes urbanae*), which formed part of the garrison of Rome and ranked above the line regiments, though below the guards (see PRÆTORIANS). The military power thus placed in the hands of the chief of the police was one of the most sorely-felt innovations of the empire. The constitutional changes of Diocletian and Constantine extended still farther the power of the præfect, in whom, after the disbanding of the guards and the removal from Rome of the highest officials, the whole military, administrative, and judicial powers were centred.

2. Under the republic judicial præfects (*præfecti iuri dicundo*) were sent annually from Rome as deputies of the prætors to administer justice in certain towns of the Italian allies. These towns were called "prefectures" (*præfecturæ*). After the Social War (90-89 B.C.), when all Italy had received the Roman franchise, such prefectures ceased to exist in fact, though the name was sometimes retained.

3. Under the empire the prætorians or imperial guards were commanded by one, two, or even three præfects (*præfecti prætorio*), who were chosen by the emperor from among the knights and held office at his pleasure. From the time of Alexander Severus the post was open to senators also, and if a knight was appointed he was at the same time raised to the senate. The position was one of great influence and importance; the prætorian præfect stood under the immediate orders of the emperor, of whom he was the natural representative and sometimes the rival. Down to the time of Constantine, who deprived the office of its military character, the prefecture of the guards was regularly held by tried soldiers, often by men who had fought their way up from the ranks. In course of time the command seems to have been enlarged so as to include all the troops in Italy except the corps commanded by the city præfect (*cohortes urbanae*). Further, the prætorian præfect acquired, in addition to his military functions, a criminal jurisdiction, which he exercised not as the delegate but as the representative of the emperor, and hence it was decreed by Constantine (331) that from the sentence of the prætorian præfect there should be no appeal. A similar jurisdiction in civil cases was acquired by him not later than the time of Severus. Hence a knowledge of law became a qualification for the post, which under Marcus Antoninus and Commodus, but especially from the time of Severus, was held by the first jurists of the age (*e.g.*, Papinian, Ulpian, and Paullus), while the military qualification fell more and more into the background. Under Constantine the institution of the *magistri militum* deprived the prætorian prefecture altogether of its military character, but left it the highest civil office of the empire.

The title of "præfect" was borne by various other Roman officials, of whom we may mention the following.

4. *Præfectus Socium (sociorum)*.—Under the republic the contingents furnished to the Roman armies by the Italian allies were commanded by Roman officers called *præfecti socium (sociorum)*, who were nominated by the consuls and corresponded to the tribunes in the legions.

5. *Præfectus Classium*.—Down to near the close of the republic a

naval command was never held independently but only in connexion with the command of an army, and, when the general appointed an officer to command the fleet in his room, this lieutenant was styled "præfect of the fleet" (*præfectus classium*). When in 311 B.C. the people took the appointment of these lieutenants into their own hands the title was changed from "præfects" to *duo viri navales*, or "two naval men"; but under the empire the admirals went by their old name of præfects.

6. *Præfectus Fabrum*.—The colonel of the engineer and artillery corps (*fabri*) in a Roman army was called a præfect; he did not belong to the legion, but was directly subordinate to the general in command.

7. *Præfectus Annonæ*.—The important duty of provisioning Rome was committed by Augustus (between 8 and 14 A.D.) to a præfect, who was appointed by the emperor from among the knights and held office at the imperial pleasure.

8. *Præfectus Egypti* (afterwards *Præfectus Augustalis*).—Under the empire the government of Egypt was entrusted to a viceroy with the title of "præfect," who was selected from the knights, and was surrounded by royal pomp instead of the usual insignia of a Roman magistrate. He stood under the immediate orders of the emperor. The exceptional position thus accorded to Egypt was due to a regard on the part of the emperors to the peculiar character of the population, the strategic strength of the country, and its political importance as the granary of Rome. (J. G. FR.)

PRÆMONSTRATIENSIS. See ABBEY, vol. i. p. 20, and MONACHISM, vol. xvi. p. 709.

PRÆMUNIRE, the name given to a writ originating in the 14th century in the attempt to put restraint on the action of the papal authority in regard to the disposal of ecclesiastical benefices in England before the same became vacant, and subsequently, to the prejudice of the rightful patron, and also in the encouragement of resort to the Roman curia rather than to the courts of the country, in disregard of the authority of the crown, leading thereby to the creation of an *imperium in imperio* and the paying that obedience to papal process which constitutionally belonged to the king alone. The word "præmunire"¹ is applied also to the offence for which the writ is granted, and furthermore to the penalty it incurs. The range and description of offences made liable to the penalties of præmunire became greatly widened subsequently to the Reformation, so that acts of a very miscellaneous character were from time to time brought within the scope of enactments passed for a very different purpose. The offence is of a nature highly criminal, though not capital, and more immediately affects the crown and Government. The statute 16 Rich. II. c. 5 (1392) is usually designated the Statute of Præmunire; it is, however, but one only of numerous stringent measures (many of which are still unrepealed) resulting from the enactment of the Statute of Provisors (35 Edw. I. c. 1), passed in a previous reign, which according to Coke (*Instit.*) was the foundation of all the subsequent statutes of præmunire. Cowel (*Laro Dict.*) describes a provisor as one who sued to the court of Rome for a provision which was called *gratia expectativa*.

The penalties of præmunire involved the loss of all civil rights, forfeiture of lands, goods, and chattels, and imprisonment during the royal pleasure. In the Habeas Corpus Act (31 Car. II. c. 2, 1679) the committing of any man to prison out of the realm was made præmunire unpardonable even by the king. It thus appears that, whilst the crown by its prerogative might at any time remit the whole or any part of the punishment incurred by a præmunire, an exception was made in transgressions of the Statute of Habeas Corpus. The Royal Marriage Act (12 Geo. III. c. 11) of 1772 is the last statute which subjects any one to the penalties of a præmunire as ordained by 16 Rich. II.

It cannot be doubted that the legislation exemplified in the Statutes of Præmunire and Provisors was felt by the

¹ Præmunire is a corruption of the Latin *præmonere*, to pre-admonish or forewarn, and is taken from the words of the writ itself, which runs "Præmunire facias" A. B., &c., i.e., cause A. B. to be forewarned that he appear to answer the contempt wherewith he stands charged.

popes to be a great check on their freedom of action. In the hands of Henry VIII. *præmunire* became eventually a lever for the overthrow of papal supremacy. The last ancient statute concerning *præmunire*, until the Reformation, was the 2 Hen. IV. c. 3 (1400), by which all persons who accepted any provision from the pope to be exempt from canonical obedience to their proper ordinary were subjected to the penalties prescribed. Bishop Stubbs,¹ in summing up his account of the various statutes of *præmunire*, succinctly says of them that they were intended to prevent encroachments on and usurpations of jurisdiction on the part of the pope, and he adds that the more important statute was that of 16 Rich. II. c. 5 (1392), which he describes as one of the strongest defensive measures taken during the Middle Ages against Rome, and which was called for in consequence of the conduct of the pope, who had forbidden the bishops to execute the sentences of the royal courts in suits connected with ecclesiastical patronage. Tomlins (*Law Dict.*) states that there is only one instance of a prosecution on a *præmunire* to be found in the state trials, in which case the penalties were inflicted upon some persons for refusing to take the oath of allegiance to Charles II. It may be added that on an indictment for *præmunire* a peer might not be tried by his peers.

See Coke, *Instit.*; Collier, *Ecc. Hist.*, 1708; Hallam, *Middle Ages*, 1868; Stephen, *Comm.*, 1853, and *Hist. Crim. Law*; and Stubbs, *Constit. Hist.*, 1880.

PRÆNESTE (now PALESTRINA), a very ancient city of Latium, lies 22 miles east of Rome on a spur of the Apennines facing the Alban Hills. To the natural strength of the place and its commanding situation Præneste owed in large measure its historical importance. The local tradition (adopted by Virgil) named Cæculus, son of Vulcan, as founder. From the remains of Cyclopean masonry and other indications the foundation of the city has been referred to the 8th century B.C., and objects in metal and ivory discovered in the earliest graves prove that as early as this or the following century Præneste had reached a considerable degree of civilization and stood in commercial relations not only with Etruria but with the East. At this time the city was probably under the hegemony of Alba Longa, then the head of the Latin League. In 499, according to Livy, Præneste withdrew from the Latin League and formed an alliance with Rome, but this statement seems irreconcilable with a passage in Dionysius Halicarnensis (*Ant. Rom.*, v. 61). After Rome had been weakened by the Gallic invasion (390), Præneste joined its foes in a long struggle with Rome. The struggle culminated in the great Latin War (340-338), in which the Romans were victorious, and Præneste was punished for its share in the war by the loss of part of its territory. It was not, however, like the other Latin cities, embodied in the Roman state, but continued in the position of a city in alliance with Rome down to the Social War, when it, like the rest of Italy, received the Roman franchise (90 or 89). As an allied city it furnished contingents to the Roman army and possessed the right of exile (*jus exilii*), i.e., persons banished from Rome were allowed to reside at Præneste. To judge from the works of art and inscriptions of this period (338 to 90 B.C.), it must have been for the place a time of prosperity and even luxury. The nuts of Præneste were famous and its roses were amongst the finest in Italy. The Latin spoken at Præneste was somewhat peculiar.² In the civil wars of Sulla the younger

Marius was blockaded in the town by the Sullans (82 B.C.); and on its capture Marius slew himself, the male inhabitants were massacred in cold blood, and a military colony was settled on part of its territory. It was probably about this time that the city was extended from the hill to the plain and that the temple of Fortune was enlarged so as to include much of the space occupied by the ancient city. Under the empire Præneste, from its elevated situation and cool salubrious air, became a favourite summer resort of the wealthy Romans, whose villas studded the neighbourhood. Horace ranked it with Tibur and Baiæ, the Bath and Brighton of Rome. Augustus resorted thither; here Tiberius recovered from a dangerous illness, and here Hadrian built himself a villa. Antoninus erected a palace to the east of the town. Amongst private persons who owned villas at Præneste were Pliny the younger and Symmachus.

But Præneste was chiefly famed for its great temple of Fortune and for its oracle, in connexion with the temple, known as the "Prænestine lots" (*sortes Prænestinae*). As extended by Sulla the sanctuary of Fortune occupied a series of six vast terraces, which, resting on gigantic substructions of masonry and connected with each other by grand staircases, rose one above the other on the hill in the form of the side of a pyramid, crowned on the highest terrace by the round temple of Fortune proper. This immense edifice, probably by far the largest sanctuary in Italy, must have presented a most imposing aspect, visible as it was from a great part of Latium, from Rome, and even from the sea. The goddess Fortuna here went by the name of Primigenia (First-Born, but perhaps in an active sense First-Bearer); she was represented suckling two babes, said to be Jupiter and Juno, and she was especially worshipped by matrons.³ The oracle of the Prænestine lots was very ancient and continued to be consulted down to Christian times. Constantine and Theodosius forbade the practice and closed the temple. In 1297 the Colonna family who then owned Præneste (Palestrina) revolted from the pope, but in the following year the town was taken and razed to the ground. In 1437 the city, which had been rebuilt, was captured by the papal general Cardinal Vitelleschi and once more utterly destroyed. It was rebuilt and fortified by Stefano Colonna in 1448. In 1630 it passed by purchase into the Barberini family. Præneste was the native town of Ælian and in modern times of the great composer Palestrina.

The modern town of Palestrina, a collection of narrow and filthy alleys, stands on the terraces once occupied by the temple of Fortune. On the summit of the hill (2546 feet), nearly a mile from the town, stood the ancient citadel, the site of which is now occupied by a few poor houses (Castel San Pietro) and a ruined mediæval castle of the Colonnas. The magnificent view embraces Soracte, Rome, the Alban Hills, and the Campagna as far as the sea. Considerable portions of the southern wall of the ancient citadel, built in very massive polygonal (Cyclopean) blocks of limestone, are still to be seen; and the two walls, also polygonal, which formerly united the citadel with the lower town, can still be traced. The ruins of the villa of Hadrian stand in the plain near the church of S. Maria

³ Hence Fernique (*Étude sur Præneste*) ingeniously conjectures that Fortuna was originally a goddess of maternity, and that the view of her functions as a goddess of chance was later, being due to the influence of Greek mythology, in which Chance (*Τύχη*) was a goddess. Fortuna contains the same root as *ferre*, "to bear." Fernique observes that the worship of Fortuna was often associated with that of Feronia. Statuettes in terra-cotta representing a woman with a child at her breast have been found at Præneste. These are supposed by Fernique to be votive offerings, representing not the goddess but the mothers who offered them at the shrine in fulfilment of vows. Fortuna was sometimes represented in the form of two (or possibly more) females, so at Antium (Macrobius, *Sat.*, i. 23, 13; Sueton., *Cal.*, 57), and perhaps at Præneste (Statius, *Sylv.*, i. 3, 80); in one of the Roman temples of Fortuna there was a mysterious veiled figure. Analogous to Fortuna in her double capacity as prophetess and patron of mothers was Carmenta, and she too was sometimes represented in double form (Ovid, *Fasti*, i. 617 sq.; Aulus Gellius, xvi. 16).

¹ *Constit. Hist. of Eng.* (1880), iii. 356 sq.

² Thus the Prænestines shortened some words: they said *conia* for *ciconia*, *tammodo* for *tantummodo* (Plaut., *Truc.*, iii. 2, 23; Id., *Trinum.*, iii. 1, 8; cp. Comment. on Festus, p. 731, ed. Lindemann), and inscriptions exhibit the forms *Acememeno* and *Tondrus* for *Agamemno* and *Tyndarus*. They said *nefrones* for *nefrendes* in the sense of *testiculi*, and *tongitio* for *notio* (Festus, s.v. "nefrendes" and "tongere"). Cp. Quintilian, *Instit.*, i. 5, 56.

della Villa, about three-quarters of a mile from the town. Here was discovered the well-known statue of Antinous, now in the Vatican. Not far off was found in 1773 the calendar which, as Suetonius tells us, was set up by the grammarian M. Verrius Flaccus in the forum of Præneste. Excavations made, especially since 1855, in the ancient necropolis, which lay on a plateau surrounded by valleys at the foot of the hill and of the town, have yielded important results for the history of the art and manufactures of Præneste. Of the objects found in the oldest graves, and supposed to date from about the 7th century B.C., the cups of silver and silver gilt and most of the gold and amber jewellery are Phœnician (possibly Carthaginian), or at least made on Phœnician models; but the bronzes and some of the ivory articles seem to be Etruscan. No objects have been discovered belonging to the period intermediate between the 7th and 3d centuries B.C.; but the graves of the 3d and 2d centuries have yielded many precious relics, bronze caskets (*cistæ*), convex metal mirrors, strigils, &c. Among these is the famous Ficoroni casket, engraved with pictures of the arrival of the Argonauts in Bithynia and the victory of Pollux over Amycus. It was found in 1774. The inscriptions on the caskets are all Latin; those on the mirrors are mostly Etruscan; those on the strigils are Latin, Greek, and Etruscan. The Latin inscriptions seem to belong to the 3d century. On the whole it appears that between the 3d and 2d centuries there existed at Præneste a native Latin art, which was, however, beginning to be affected by Greek art. Most of the objects discovered in the necropolis are preserved in the Roman collections, especially the Kircher Museum (which possesses the Ficoroni casket) and the Barberini Library. Besides these there is preserved in the Barberini Palace at Palestrina a large mosaic, considered one of the most important in existence. It was found on the site of the temple of Fortune and probably dates from the age of Augustus or Tiberius. It represents scenes from the Nile, with animals and figures in Egyptian and Greek costume. (J. G. FR.)

PRÆTOR (*præ-itor*, "he who goes before," "a leader"), originally a military title, was in classical times the designation of the highest magistrates in the Latin towns. The Roman consuls were at first called "prætors"; in the early code of the Twelve Tables (450 B.C.) they appear to have had no other title. By the Licinian law of 367 B.C., which abolished the military tribunes with consular power and enacted that the supreme executive should henceforward be in the hands of the two consuls, a new magistrate was at the same time created who was to be a colleague of the consuls, though with lower rank and lesser powers. This new magistrate was entrusted with the exclusive jurisdiction in civil cases; in other respects his powers resembled those of the consuls. His distinctive title was the "city prætor" (*prætor urbanus*), and in after time, when the number of prætors was increased, the city prætor always ranked first. To this new magistrate the title of "prætor" was henceforward properly restricted.¹ About 242 B.C. the increase of a foreign population in Rome necessitated the creation of a second prætor for the decision of suits between foreigners (*peregrini*) or between citizens and foreigners. This prætor was known at a later time as the "foreign prætor" (*prætor peregrinus*). About 227 B.C. two more prætors were added to administer the recently acquired provinces of Sicily and Sardinia. The conquest of Spain occasioned the appointment of two more in 197 B.C., of whom one governed Hither and the other Further Spain. The number of prætors, thus augmented to six, remained stationary till Sulla's time, 82 B.C. But in the interval their duties vastly multiplied. On the one hand, five new provinces were added to the Roman dominions—Macedonia and Achaia in 146 B.C., Africa in the same year, Asia in 134, Gallia Narbonensis in 118, Cilicia probably in 102. On the other hand, new and permanent jury courts (*quæstiones perpetuæ*) were instituted at Rome, over which the prætors were called on to preside. To meet this increase of business the tenure of office of the prætors and also of

the consuls was practically prolonged from one to two years, with the distinction that in their second year of office they bore the titles of "proprætor" and "proconsul" instead of "prætor" and "consul." The prolongation of office, together with the participation of the proconsuls in duties which properly fell to the prætors, formed the basis of Sulla's arrangements. He increased the number of the prætors from six to eight, and ordained that henceforward all the eight should in their first year administer justice at Rome and in their second should as proprætors undertake the government of provinces. The courts over which the prætors presided, in addition to those of the city prætor and the foreign prætor, dealt with the following offences:—oppression of the provincials (*repetundarum*), bribery (*ambitus*), embezzlement (*peculatus*), treason (*majestatis*), murder (*de sicariis et veneficiis*), and probably forgery (*falsi*). A tenth province (Gallia Cisalpina) was added to the previous nine, and thus the number of judicial and provincial departments corresponded to the annual number of prætors, proprætors, and proconsuls. The proportion, however, was not long maintained: new provinces were added to the empire—Bithynia in 74 B.C., Cyrene about the same time, Crete in 67, Syria in 64—and one or more new law courts were instituted. To keep pace with the increase of duties Julius Cæsar increased the number of prætors successively to ten, fourteen, and sixteen; after his time the number varied from eight to eighteen.

The prætors were elected, like the consuls, by the people assembled in the *comitia centuriata* and with the same formalities. (See **CONSUL**.) They regularly held office for a year; only in the transition period between the republic and the empire was their tenure of office sometimes limited to a few months. The insignia of the prætor were those common to the higher Roman magistrates,—the purple-edged robe (*toga prætexta*) and the ivory chair (*sella curulis*); in Rome he was attended by two lictors, in the provinces by six. The prætors elect cast lots to determine the department which each of them should administer. A prætor was essentially a civil judge, and as such he was accustomed at or before his entry on office to publish an edict setting forth the rules of law and procedure by which he intended to be guided in his decisions. As these rules were often accepted by his successors the prætor thus acquired an almost legislative power, and his edicts thus continued, corrected, and amplified from year to year became, under the title of the "perpetual edicts," one of the most important factors in moulding Roman law. Their tendency was to smooth away the occasional harshness and anomalies of the civil law by substituting rules of equity for the letter of the law, and in this respect the Roman prætor has been compared to the English chancellor. His functions were considerably modified by the introduction of the standing jury courts (*quæstiones perpetuæ*). Hitherto the prætor had conducted the preliminary inquiry as to whether an action would lie, and had appointed for the actual trial of the case a deputy, whom he instructed in the law applicable to the case and whose decisions he enforced. The proceedings before the prætor were technically known as *jus* in distinction from *judicium*, which was the actual trial before the deputy judge. But in the standing jury courts (of which the first—that for *repetundæ*—was instituted in 149 B.C.), or rather in the most important of them, the prætors themselves presided and tried the cases. These new courts, though formally civil, were substantially criminal courts; and thus a criminal jurisdiction was added to the original civil jurisdiction of the prætors. Under the empire various special functions were assigned to certain prætors, such as the two treasury prætors (*prætores ærarii*), appointed by Augustus in 23 B.C.; the spear prætor (*prætor hastarius*), who presided over the

¹ Some writers, following Livy, vi. 42, assert that at first the prætorship was open to patricians only, but Mommsen (*Röm. Staatsrecht*, ii. p. 195) shows that this is probably a mistake. The election of a plebeian to the office for the first time in 337 B.C. was certainly opposed by the consul who presided at the election, but there appears to have been no legal obstacle to it.

court of the Hundred Men, which dealt especially with cases of inheritance; the two trust prætors (*prætores fideicommissarii*), appointed by Claudius to look after cases of trust estates, but reduced by Titus to one; the ward prætor (*prætor tutelaris*), appointed by Marcus Antoninus to deal with the affairs of minors; and the liberation prætor (*prætor de liberalibus causis*), who tried cases turning on the liberation of slaves. There is no evidence that the prætors continued to preside over the standing courts after the beginning of the 3d century A.D., and the foreign prætorship disappears about this time.¹ Even the jurisdiction of the city prætor seems not to have survived the reforms of Diocletian, though the office itself continued to exist. But of the prætorships with special jurisdiction (especially the ward prætorship and the liberation prætorship) some lasted into the 4th century and were copied in the constitution of Constantinople.

Besides their judicial functions, the prætors, as colleagues of the consuls, possessed, though in a less degree, all the consular powers, which they regularly exercised in the absence of the consuls; but in the presence of a consul they exercised them only at the special command either of the consul or, more usually, of the senate. Thus the prætor possessed military power (*imperium*); even the city prætor, though attached by his office to Rome, could not only levy troops but also in certain circumstances take the command in person. As provincial governors the prætors had frequent occasion to exercise their military powers, and they were often accorded a triumph. The city prætor presided over popular assemblies for the election of certain inferior magistrates, but all the prætors officiating in Rome had the right to summon assemblies for the purpose of legislation. In the absence of the consuls the city prætor, and in default of him the other prætors, were empowered to call meetings of the senate. Public religious duties, such as the fulfilment of state vows, the celebration of sacrifices and games, and the fixing of the dates of movable feasts, probably only fell to the prætors in the absence of the consuls. But since in the early times the consuls as a rule spent only the first months of their year of office in Rome it is probable that a considerable share of religious business devolved on the city prætor; this was certainly the case with the Festival of the Cross-roads (*compitalia*), and he directed the games in honour of Apollo from their institution in 212 B.C. Augustus in 22 B.C. placed the direction of all the popular festivals in the hands of the prætors, and it is not without significance that the prætors continued thus to minister to the pleasures of the Roman mob for centuries after they had ceased almost entirely to transact the business of the state. For the prætor as provincial governor, see PROVINCE. (J. G. FR.)

PRÆTORIANS (*prætoriani*) was the name borne by the body-guards of the Roman emperors. The name was derived from the prætorian cohort, a picked body of troops who in the time of the republic formed the guard of a general in command of an army, the old Latin name for a general being *prætor* and his quarters in the camp being known as the *prætorium*. As the emperor was commander-in-chief the headquarters (*prætorium*) were established at Rome, and one of the earliest measures of Augustus was the new organization of the guard. The command of the prætorians rested legally with the emperor, but after 2 B.C. it was practically exercised by one or more colonels chosen by the emperor with the title of "prætorian præfects" (*præfecti prætorio*, see PRÆFECT). The prætorians were divided into cohorts of 1000 men each, horse and foot, and hence they are often referred to as the prætorian cohorts.

Augustus raised nine corps, of which he quartered three in different parts of Rome and the rest in neighbouring cities. One cohort kept guard in the palace. Under Tiberius the crafty and energetic prætorian præfect Sejanus collected the prætorians into a permanent fortified camp outside the Viminalian Gate of Rome. Thus united they acquired and exercised the power of making and unmaking emperors. The number of the cohorts was raised temporarily by Vitellius to sixteen; from 112 A.D. to the end of the 3d century, and probably to the time of Constantine, the number was ten. At first they were recruited exclusively from Italy, but afterwards from the Romanized provinces also of Spain, Noricum, and Macedonia. Their pay was nominally double, but really more than double, that of the legionaries;² their period of service was shorter, being sixteen years instead of at least twenty; and from the time of Claudius it was the custom of the emperors on their succession to the throne to purchase the favour of their powerful guards by a liberal donative. But the sense of their own power, to which these special privileges bore witness, fostered the pride, while the luxurious life of the capital relaxed the discipline, of the prætorians. Their insolence culminated when they murdered the virtuous Pertinax, put the empire up to auction, and knocked it down to the highest bidder (193). In the same year they were disgraced and disbanded by Severus, only, however, to be replaced by a still more numerous corps,³ which was now recruited indifferently from all parts of the empire. Diocletian reduced their numbers, and they were finally suppressed by Constantine in 312.

PRÆTORIUS, MICHAEL (1571-1621), German musical historian, theorist, and composer, was born at Kreuzberg in Thuringia on 15th February 1571. He acted as kapellmeister at Lüneburg early in life, was engaged first as organist and later as kapellmeister and secretary to the duke of Brunswick, and was eventually rewarded for his long services with the priory of Ringelheim, near Goslar. He died at Wolfenbüttel on 15th February 1621. Of his very numerous compositions copies are now so scarce that it is doubtful whether a complete set is anywhere to be found. The most important are—*Polyhymnia* (15 vols.), *Musæ Sionis* (16 vols.), and *Musa Aonia* (9 vols.), all written partly to Latin and partly to German words. But more precious than all these is the *Syntagma musicum* (3 vols. and a cahier of plates, 4to, Wittenberg and Wolfenbüttel, 1615-20). Only two copies of this very rare work are believed to exist in England, one in the library of the Rev. Sir F. A. Gore-Ouseley and the other in that of Mr Alfred Littleton. In the original prospectus of the work four volumes were promised, but it is certain that no more than three were ever published. The fourth volume mentioned in Forkel's catalogue is clearly nothing but the cahier of plates attached to vol. ii.

² The legionaries received 10 asses daily, or 3600 asses (= 225 denarii) annually; the prætorians received twenty asses daily, or 7200 asses annually. But, whereas in paying the legionaries the as was reckoned at its current value of 16 to the denarius, in paying the prætorians it was reckoned at its old and higher value of 10 to the denarius, and hence the 7200 asses of a prætorian were equal to 11,520 asses at the current rate, or 720 denarii. This is Mommsen's highly ingenious and probable explanation of the apparent discrepancy between the statements of Dio Cassius (l. iii. 11, 55) and Tacitus (*Ann.*, i. 17). See Marquardt's *Römische Staatsverwaltung*, ii. p. 480. Pliny (*N. H.*, xxxiii. 45) states that after the value of the as was lowered it continued to be reckoned at its old value in the payment of soldiers. But by combining the statements of Suetonius (*Cæs.*, 26, and *Domit.*, 7) we see that Julius Cæsar, while he nominally and really raised the pay of the soldiers, paid it in asses of the current value, and hence after his time it was only the prætorians who retained the privilege of having their pay reckoned in asses of the old value (see Marquardt, *op. cit.*, p. 95).

³ According to Herodian (iii. 13, 4) Severus increased the troops in Rome fourfold.

⁴ German *Schultz* or *Schultze* (*Schultheiss*), meaning the head-man of a township, Latinized into *Prætor* or *Prætorius*. Many other members of the family of *Prætorius* were eminent as musicians.

¹ Marquardt conjectures with much probability that when Caracalla extended the Roman franchise to the whole empire he at the same time abolished the foreign prætorship.

The chief value of this very remarkable work lies in the information it gives concerning the condition of instrumental music in the early years of the 17th century. The plates include excellent representations of all the musical instruments in use at the time they were published, together with many forms even then treated only as antique curiosities. Many of these instruments are known to us only through these representations and the descriptions with which they are accompanied, the instruments themselves having long fallen into disuse, and no real examples having been preserved to us. Among the most important instruments described and figured are the whole family of flutes, oboes, and bassoons; the different kinds of trombone, many of which exactly resemble those now in use; trumpets and horns of all conceivable varieties; viols, violins, and basses; the entire family of stringed and keyed instruments, including the psaltery, the spinet, the harpsichord, and a curious combination of the harpsichord and viol called the "Nurembergisch Geigenwerck," known only through this description; and finally the organ, to the historical and technical description of which an entire section is devoted. The work thus throws a light upon the earlier forms of instrumental music which to the historian is invaluable. In fact, without the information bequeathed to us by Prætorius it would be impossible to reconstruct in theory the orchestra of the earlier half of the 17th century, during which the opera and the oratorio both sprang into existence, or even to understand the descriptions left us by other less careful writers.

PRAGMATIC SANCTION, the technical name given to some decrees which have been issued as fundamental laws. The term is of Byzantine origin, the edicts of the Eastern emperors having been called "pragmatics." There is a famous document known as the Pragmatic Sanction of St Louis, which contains six articles directed against the assumptions of the papacy; but there are reasons for doubting its genuineness. In 1438 Charles VII. of France issued at Bourges a pragmatic sanction which embodied the most important decisions of the council of Basel. This decree formed the basis of the liberties of the Gallican Church. Louis XI. entered into negotiations with the papacy for its revocation; but it continued in force until the time of Francis I., who substituted for it a concordat with Pope Leo X. The decisions of the council of Basel were also embodied in a pragmatic sanction by a diet which met at Mainz in 1439; but by the concordat of Vienna, concluded in 1448 by the emperor Frederick III. with Pope Nicholas V., most of the advantages which the diet had hoped to secure for the church in Germany were abandoned. The most famous of all pragmatic sanctions was that of the emperor Charles VI. In 1713 it was issued as a family statute, but, as the emperor proposed that it should become a fundamental law of the state, it was afterwards submitted to the diets of the lands ruled by the house of Austria by hereditary right. Having been accepted by the estates of Lower Austria and Bohemia in 1720, by the Hungarian diet in 1722, and by the remaining diets between 1720 and 1724, it was proclaimed as a fundamental law on the 6th of December 1724. By this edict it was decreed that the Austrian lands should always be united; that they should be ruled by Charles VI.'s male descendants; that, if he had no male descendants, his territories should pass to his female descendants; and that, if his female descendants died without issue, the right of succession should belong to the daughters of his brother Joseph and to their male and female offspring in accordance with the law of primogeniture. In the interest of his daughter Maria Thérèse the emperor spared no pains to secure from the empire and from the other powers guarantees for the execution of this law; and, when his nieces, who as the daughters of his elder brother might prove to be dangerous rivals of Maria Thérèse, were married, one to the electoral prince of Saxony, the other to the electoral prince of Bavaria, he caused them to declare on oath that they abandoned their claims. Nevertheless after his death the pragmatic sanction led to the War of the Austrian Succession. In 1759 a pragmatic sanction was issued by Charles III. of Spain granting the throne of the Two Sicilies to his third son and his descendants.

PRAGUE (German, *Prag*; Bohemian, *Praha*), the capital of Bohemia, the seat of an archbishop, and the third largest town of the Austrian-Hungarian monarchy, lies on both banks of the Moldau in 50° 5' N. lat. and 14° 25' E. long., 150 miles to the north-west of Vienna and 75 miles to the south-south-east of Dresden. Its position, near the centre of the country and at the only point where the valley of the Moldau expands sufficiently to make room for a great city, marks it out as the natural capital of Bohemia, and the picturesque effect of its masses of buildings and innumerable spires and towers, filling the valley and climbing the hills on either side, is enhanced by their stirring historical background. The heights on the left bank descend somewhat rapidly to the river and are crowned by the venerable Hradschin, or palace of the Bohemian kings, which forms the dominant feature in every view of the town. On the other bank there is a considerable level space between the river and the base of the hills. An additional charm is lent to the scene by the pleasant green islands in the Moldau, which is here 500 to 1500 feet in width. The general features of the situation recall those of Budapest, and the smaller scale is fully compensated for by the greater variety and interest of the buildings.

The town proper consists of four main divisions, the Altstadt and the Neustadt on the right bank of the Moldau, and the Kleinseite and the Hradschin on the left. Immediately beyond the old line of circumvallation are the suburbs of Carolinenthal, Wyscherad, Smichow, and Weinberg, while these in turn are adjoined by various outer suburban districts. Down to 1866 Prague was surrounded with walls and bastions, which, however, had long lost their military importance, and have since been, to a great

Plan of Prague.

extent, removed. The two sides of the river are connected by seven bridges, of which the most important are the Kaiser Franz suspension bridge, the new Palacky bridge, and the fine old Carls bridge. This last, erected between 1350 and 1500, is closed at each end by a mediæval gate-tower, of which that to the east is particularly interesting. The numerous buttresses are adorned with statues of saints,

among them that of St John Nepomuk, who earned his title to be regarded as the patron saint of bridges from the fact that he here allowed himself to be thrown into the Moldau at the order of King Wenceslaus rather than divulge the queen's confidences in the confessional (1393). The statue is regarded with great veneration and is visited by thousands of devotees on the saint's anniversary (16th May).

The *Altstadt*, or old town, is the most densely populated part of Prague and the principal seat of traffic. Most of the streets are narrow and irregular, but the centre of the district is occupied by a spacious square called the Grosser Ring, and the side next the Moldau is bordered by wide quays embellished with handsome monuments to Charles IV. and Francis I. On one side of the Ring stands the town-house, to a great extent rebuilt, but still comprising part of the mediæval structure that witnessed so many of the stormy scenes of Bohemian history. Opposite is the Teyn church, or old church of the Calixtine Hussites, built in 1407, and containing the tomb of Tycho Brahe, the Danish astronomer. Another interesting structure is the Late Gothic Pulverthurm, a relic of the old wall that once separated the Altstadt from the Neustadt. The Altstadt is also the seat of the university and several other educational establishments. The university, founded by Charles IV. in 1348, was the first in the German empire, and was attended by 10,000 to 15,000 students, until invidious distinctions made between Bohemians and Germans led the latter to secede in a body and found academies for themselves in other parts of Germany. The institution, however, still ranks high among European seats of learning and numbers above 2600 students. Lectures are delivered both in Bohemian and in German, and students may graduate in either language. The faculties of medicine and law occupy the Carolinum near the town-hall, while those of theology and philosophy are established in the Clementinum, a huge old Jesuit college, which also comprises the university library (180,000 vols.), several chapels, a school, and the archiepiscopal seminary. The most conspicuous modern buildings are the civil courts, the savings bank, and the Rudolfinum, a large Renaissance edifice on the quay, containing an academy of art, a conservatorium for music, and an industrial museum. The church of the Knights of the Cross (Kreuzherrenkirche) is an imposing building modelled on St Peter's at Rome, and the palace of Count Clam Gallas is a tasteful Renaissance structure of 1701. Enclosed within the Altstadt is the Josephstadt, or Jewish quarter, a labyrinth of crowded and dingy streets, to which the Jews were strictly confined down to 1848. The Jewish colony of Prague is one of the most ancient in Europe; the Jewish cemetery, with its thousands of closely-packed tombstones interspersed with shrubs and creeping plants, is one of the most curious sights in Prague.

The *Neustadt*, or new town, surrounds the old town in the form of a semicircle, reaching the river both to the north and to the south of it. The site of the old wall and moat that formerly separated the two quarters is now occupied by a line of the handsomest and busiest streets in Prague, and the rest of the Neustadt also consists of broad and well-built streets and squares. Conspicuous among the buildings are the numerous hospitals and asylums on the south side, forming a phalanx of charitable institutions that do great credit to the philanthropy of the citizens. The town-house, now used as a criminal court, is interesting as the spot where the Bohemian Hussite war was inaugurated by the hurling of several unpopular councillors from the window. Other noteworthy edifices are the Bohemian museum, the Bohemian technical college (1500 students), the magnificent new Bohemian theatre (erected at a cost of £200,000), and the churches of

Carlschhof, Emmaus, and Maria Schnee. To the south the Neustadt is adjoined by the Wyscherad, or citadel, the oldest part of Prague. The original fortress was almost entirely destroyed by the Hussites, and the present fortifications are modern.

The *Kleinseite*, or Little Prague, on the left bank of the Moldau, occupies the slopes of the Laurenzberg and the Hradschin and is the headquarters of the aristocratic and official classes. Like the Altstadt, its centre is formed by a "ring," containing the large and handsome Jesuit church of St Nicholas and a fine monument to Marshal Radetzky. The most generally interesting of the numerous palaces of the Bohemian noblesse is the Palace Waldstein or Wallenstein, an extensive edifice built by the hero of the Thirty Years' War and still occupied by his descendants. Kleinseite also contains the hall of the Bohemian diet and the residence of the statthalter or governor of Bohemia. To the north it ends in the pleasant promenades named after the crown-prince Rudolf, which stretch along the bank of the Moldau.

The *Hradschin*, or castle hill, rises abruptly behind the Kleinseite to a height of about 240 feet. The imperial palace, a vast and irregular group of buildings crowning the height, is remarkable rather for its situation and extent than for architectural importance. It is said to have been founded by Princess Libussa, and was greatly enlarged by Charles IV. and others, but now offers little of a mediæval character with the exception of two or three towers. Few of the 440 rooms it is said to contain are of any special interest; in the council chamber is still pointed out the window from which the imperial councillors Martinitz and Slavata were hurled in 1618. Within the large court of the palace stands the cathedral of St Vitus, begun in 1344, in evident imitation of the cathedral of Cologne, but consisting of little more than the extensive Late Gothic choir (1385). Efforts are now being made to bring it to completion. The tower was originally 500 feet high, but lost two-fifths of its height by a fire. The interior enshrines several works of considerable interest and value, such as the mausoleum of the Bohemian kings, a fine Renaissance work in alabaster and marble by Alex. Colin of Mechlin (1589); the shrine of St John Nepomuk, said to contain 1½ tons of solid silver; and the chapel of St Wenceslaus, the walls of which are encrusted with jasper, chalcedony, and amethyst. In the treasury are the Bohemian regalia. The palace precincts also enclose the church of St George, dating from the 12th century, and one of the few Romanesque edifices of which Prague can boast. To the west of the imperial palace is a wide square with three large palaces, one belonging to the archbishop of Prague. Farther on is another square, surrounded by the extensive palace of Count Czernin (now a barrack), a large Capuchin monastery, and the church of St Loretto, an imitation of the wandering Casa Santa. At the extreme west of this quarter, adjoining the wall, is the imposing monastery of Strahov, possessing a good collection of pictures and a large library. To the north of the imperial palace is a picturesque gorge called the Hirschgraben, beyond which are the palace gardens, containing the Belvedere, a villa erected by Ferdinand I. in 1536, and considered one of the most tasteful reproductions of Italian architecture to the north of the Alps.

Prague is unusually well supplied with public parks and gardens, as, in addition to those already mentioned, pleasure-grounds have been laid out on the islands in the Moldau, on the slopes of the Laurenzberg, and on part of the ground occupied by the old fortifications. Among the most popular resorts are the charming grounds of the Baumgarten, a mile to the north of the Kleinseite. Both the industry and the commerce of Bohemia have their

focus in Prague, the chief seats of the former being the large manufacturing suburbs of Smichow (21,000 inhabitants) and Carolinenthal (20,000 inhabitants), the one to the south of the Kleinseite and the other to the north-east of the Neustadt. The most prominent items in a very miscellaneous list of industrial products are linen, cotton, calico, and leather goods, gloves, machinery, confectionery, beer, and chemicals. Garnet wares also form a specialty. Trade is facilitated by an extensive system of roads and railways, but the river navigation is unimportant owing to the numerous weirs and the insufficient depth. In 1880 Prague proper contained 162,323 inhabitants, or including the suburban districts about 250,000; and at the beginning of 1885 the total population was officially stated at 272,333. Nearly five-sevenths of these are of Slavonic race, while all are Roman Catholics with the exception of 20,000 Jews and 5000 Protestants. The Germans, however, though diminishing in relative numbers, still claim to represent the bulk of the capital and culture of the city. The garrison consists of from 8000 to 10,000 men.

The foundation of Prague is ascribed to the princess Libussa, who appears at the beginning of the 8th century of our era as ruling the Bohemians from her stronghold of Wyscherad on the right bank of the Moldau. It is at least certain that the town made rapid progress under the fostering care of the early Bohemian sovereigns, and in the 13th century it was able to bid defiance to the Tatar hordes that then overran the country. Its chief period of prosperity was the reign of Charles IV. (1346-1378), who by founding the university, establishing fairs, and investing the town with valuable privileges attracted to it numerous strangers. At this time Prague was perhaps the most important town in Germany, and could even boast of an independent school of art. Afterwards, however, Prague became the centre of the agitation that culminated in the Hussite wars, and thus brought upon itself a long train of misfortunes. The Hussites took possession of the city soon after defeating the emperor Sigismund, and allowed their religious zeal to carry them so far as to destroy many of the most interesting old churches in the city—a fact that accounts for the want of venerable ecclesiastical edifices in Prague. The town was, however, afterwards rebuilt by the imperialists upon an improved scale. Under Rudolf II. (1576-1612) a second season of prosperity was enjoyed; Copernicus, Tycho Brahe, and other men eminent in science, art, or letters flocked to the court of this enlightened monarch and contributed to the importance of his capital. Prague suffered its full share of the evils of the Thirty Years' War, which may be said to have begun here with the precipitation of the councillors from the window of the Hradschin (1618), and to have ended here with the occupation of the Kleinseite by the Swedes in 1648. The town was occupied by the imperialists after the defeat of the Protestants at the White Hill in 1620, and its Protestant sympathies caused it to find scant grace in the eyes of the victors. It was taken by the Swedes in 1631, by Wallenstein in 1632, by the French and Bavarians in 1741, and by Frederick the Great in 1744. In 1757 it narrowly escaped a second capture by Frederick, who held it closely invested after defeating the Austrians at the battle of Prague, but was compelled to raise the siege by the disaster of Kolin. This was the last time Prague underwent a siege, though it was occupied by the Prussians in 1866. During the present century its material advance has been unbroken, but its harmonious social development has been hampered by the disunion between the Czechish and German elements of its population. The revolutionary ideas of 1848 found a warm response in the nationalist party of Bohemia, and a Pan-Slavonic congress was opened at Prague in May of that year. Unfortunately, however, a collision took place between the military and the populace, and Prince Windischgrätz forcibly dissolved the congress and bombarded the town for two days. In 1862 a new impetus was given to the Slavonic agitation by the formation of a Bohemian diet, and since then the fissure between the warring races has grown wider rather than diminished. The Slavs seem to be steadily gaining ground at the expense of the Germans both in numbers and influence. Among the celebrated natives of Prague the most eminent in public interest are John Huss (1369-1415) and Jerome of Prague (c. 1365-1416). A fragment of the house of the former is still shown in the Altstadt. (J. F. M.)

PRAHRAN, a city of Victoria, Australia, is situated about 3½ miles south-east of Melbourne, with which it is connected by the Melbourne and Brighton Railway, and by road over a fine iron girder bridge which crosses the

Yarra. It is a well-built city, with handsome shops and numerous villas. Among the public buildings are the town-hall, with a lofty tower, containing the rooms of the free library, and the mechanics' institute. There are a number of charitable institutions. Prahran was created a municipality in 1856, a borough in 1863, and a city in 1879. The area of the city is 2320 acres, with a population in 1881 of 21,169.

PRAIRIE DOG. See MARMOT, vol. xv. p. 560.

PRAKRIT (*prākṛta*, "common," as contrasted with *sanskṛta*, "perfect") is the term applied to the vernacular languages of India derived from Sanskrit. In the Sanskrit drama all except the highest male characters speak Prakrit. Prakrit grammar was written in the Hindu scientific style—on the lines of Pāṇini—by Vararuci, one of the "nine gems" of Vikramāditya's court,¹ and by Hemacandra; these grammarians distinguish at least four different kinds of Prakrit, the relations and localization of which are by no means clear. The word Prakrit is sometimes used of all the still spoken Aryan vernaculars of India. See SANSKRIT.

PRAM, CHRISTEN HENRIKSEN (1756-1821), Scandinavian poet, was born in Gudbrandsdal, Norway, in 1756, and educated in Copenhagen, where in 1781 he received an appointment in the chamber of commerce, which gave him considerable leisure for literature. In 1785 he published *Stærkodder*, a romantic epic based on some of the old Scandinavian legends, in fifteen cantos, and in the same year he began to edit *Minerva*, a journal of some influence in Danish literature. He also wrote two tragedies (*Damon and Pythias* and *Frode and Fingal*), several comedies, and a number of tales characterized by brightness and humour. In 1819 he removed to the West-Indian island of St Thomas, where he died on 25th November 1821. His select poetical works were afterwards edited, with a biography, by his friend K. L. Rahbek (6 vols., 1824-29). Compare DENMARK, vol. vii. p. 91.

PRATINCOLE, a word apparently invented by Latham (*Synopsis*, v. p. 222), being the English rendering of *Pratincola*, applied in 1756 by Kramer (*Elenchus*, p. 381) to a bird which had hitherto received no definite name, though it had long before been described and even recognizably figured by Aldrovandus (*Ornithologia*, xvii. 9) under the vague designation of "*hirundo marina*." It is the *Glareola pratincola* of modern ornithologists, forming the type of a genus *Glareola*, founded by Brisson² in 1760, and unquestionably belonging (as is now generally admitted) to the group *Limicolæ*, being either placed in the Family *Charadriidæ* or regarded as constituting a separate Family *Glareolidæ*. The Pratincoles, of which some eight or nine species have been described, are all small birds, slenderly built and mostly delicately coloured, with a short stout bill, a wide gape, long pointed wings, and a tail more or less forked. In some of their habits they are thoroughly Plover-like, running very swiftly and breeding on the ground, but on the wing they have much the appearance of Swallows, and like them feed, at least partly, while flying.³ The ordinary Pratincole of Europe,

¹ The era of Vikramāditya is reckoned from 56 B.C., but many authorities place him 550 A.D.

² Not by Gmelin as inadvertently misstated (ORNITHOLOGY, vol. xviii. p. 19, note 1).

³ This combination of characters for many years led systematizers astray, though some of them were from the first correct in their notions as to the Pratincole's position. Linnæus, even in his latest publication, placed it in the genus *Hirundo*; but the interleaved and annotated copies of his *Systema Naturæ* in the Linnean Society's library shew the species marked for separation and insertion in the Order *Grallæ*—*Pratincola trachelia* being the name by which he had meant to designate it in any future edition. He seems to have been induced to this change of view mainly through a specimen of the bird sent to him by John the brother of Gilbert White; but the opinion

G. pratincola, breeds abundantly in many parts of Spain, Barbary, and Sicily, along the valley of the Danube, and in Southern Russia, while owing to its great powers of flight it frequently wanders far from its home, and more than a score of examples have been recorded as occurring in the British Islands. In the south-east of Europe a second and closely-allied species, *G. nordmanni* or *G. melanoptera*, which has black instead of chestnut inner wing-coverts, accompanies or, further to the eastward, replaces it; and in its turn it is replaced in India, China, and Australia by *G. orientalis*. Australia also possesses another species, *G. grallaria*, remarkable for the great length of its wings and much longer legs, while its tail is scarcely forked—peculiarities that have led to its being considered the type of a distinct genus or subgenus *Stiltia*. Two species, *G. lactea* and *G. cinerea*, from India and Africa respectively, seem by their pale coloration to be desert forms, and they are the smallest of this curious little group. The species whose mode of nidification is known lay either two or three eggs, stone-coloured, blotched, spotted, and streaked with black or brownish-grey. The young when hatched are clothed in down and are able to run at once—just as are young Plovers. (A. N.)

PRATO, a city and bishop's see of Italy, in the province of Florence, on the north edge of the alluvial plain which extends between Florence and Pistoia. By rail it is distant from the former city $11\frac{1}{2}$ miles and from the latter $9\frac{3}{4}$. The cathedral of St Stephen, which stands in a square surrounded by houses of the 16th century, is partly of the 12th and partly of the 14th and 15th centuries. The façade, in alternate bands of white calcareous sandstone and green serpentine, has a fine doorway and a bas-relief by Luca della Robbia; but the most striking external feature is the lovely open-air pulpit at an angle of the building, erected (1428) by Donatello and Michelozzo for displaying to the people without risk the Virgin's girdle, brought from the Holy Land by a knight of Prato in 1130. The chapel of the Girdle has frescos by Agnolo Gaddi and a statue of the Virgin by Giovanni Pisano; and the frescos in the choir are considered the most important work of Fra Filippo Lippi (*q.v.*). The municipal palace also possesses a collection of Lippi's paintings. Prato is a busy industrial town, the seat of a great straw-plaiting establishment, paper-mills, brass-foundries, &c., and outside of the gates which pierce the old city walls several small suburbs have grown up. The city had 13,410 inhabitants in 1881 (inclusive of the suburbs, 15,510) and the commune 16,641.

Prato is said to be first mentioned by name in 1107, but the cathedral appears as early as 1048 as the parish church of Borgo Cornio or Santo Stefano. In 1313 the town acknowledged the authority of Robert, king of Naples, and in 1350 Niccola Acciajoli, seneschal of Joanna, sold it to the Florentines for 17,500 florins of gold. In 1512 it was sacked by the Spaniards under General Cardona. In 1653 it obtained the rank of city.

PRATT, CHARLES. See CAMDEN, EARL.

PRAXITELES, a Greek sculptor, son and apparently also pupil of the Athenian Cephisodotus. An account of his works is given in vol. ii. p. 361; but since that was written there has been found at Olympia, where it still remains, a marble statue from his hand, Hermes carrying the infant Dionysus. Though a work of comparatively youthful years, as may be inferred from his obvious indebtedness to his father Cephisodotus, particularly in the published in 1769 by Scopoli (*Ann. I. hist. naturalis*, p. 110) had doubtless contributed thereto, though the earlier judgment to the same effect of Brisson, as mentioned above, had been disregarded. Want of space here forbids a notice of the different erroneous assignments of the form, some of them made even by recent authors, who neglected the clear evidence afforded by the internal structure of the Pratincole. It must suffice to state that Sundevall in 1873 (*Tentamen*, p. 86) placed *Glareola* among the *Caprimulgidae*, a position which osteology shews cannot be maintained for a moment.

figure of Dionysus, it is nevertheless a masterpiece in those qualities for which Praxiteles was famed in antiquity, the representation of what is called sympathetic types of human or divine beings, and the rendering of very subtle phases of emotion. The Hermes, while massive in build, is flexible and sensitive in his skin and flesh, indolent in his attitude, his mind sufficiently occupied for the moment in trifling with the infant on his left arm. In recent years it has been sought to prove that certain of the sculptures attributed in antiquity to Praxiteles were really the work of a grandfather of his of the same name. But the tendency of investigation has rather been to dispel these views as illusory.

PRECEDENCE. This word in the sense in which it is here employed means priority of place, or superiority of rank, in the conventional system of arrangement under which the more eminent and dignified orders of the community are classified on occasions of public ceremony and in the intercourse of private life. In the United Kingdom there is no complete and comprehensive code whereby the scheme of social gradation has been defined and settled, once and for all, on a sure and lasting foundation. The principles and rules at present controlling it have been formulated at different periods and have been derived from various sources. The crown is the fountain of honour, and it is its undoubted prerogative to confer on any of its subjects, in any part of its dominions, such titles and distinctions and such rank and place as to it may seem meet and convenient. Its discretion in this respect is altogether unbounded at common law, and is limited in those cases only wherein it has been submitted to restraint by Act of parliament. In the old time all questions of precedence came in the ordinary course of things within the jurisdiction of the Court of Chivalry, in which the lord high constable and earl marshal presided as judges, and of which the kings of arms, heralds, and pursuivants were the assessors and executive officers. When, however, points of unusual moment and magnitude happened to be brought into controversy, they were occasionally considered and decided by the sovereign in person, or by a special commission, or by the privy council, or even by the parliament itself. But it was not until towards the middle of the 16th century that precedence was made the subject of any legislation in the proper meaning of the term.¹

In 1539 an Act "for the placing of the Lords in Parliament" (31 Hen. VIII. c. 10) was passed at the instance of the king, and by it the relative rank of the members of the royal family, of the great officers of state and the household, and of the hierarchy and the peerage was definitely and definitively ascertained.² In 1563 an Act "for declaring the authority of the Lord Keeper of the Great Seal and the Lord Chancellor to be the same" (5 Eliz. c. 18) also declared their precedence to be the same. In 1689 an

¹ Ample materials for the satisfaction of the curiosity of those who are desirous of investigating the history of precedence under its wider and more remote aspects will be found in such writers as Selden or Mackenzie, together with the authorities quoted or referred to by them—Selden, *Titles of Honor*, part ii. p. 740 sq. (London, 1672); Mackenzie, *Observations upon the Laws and Customs of Nations as to Precedency* (Edinburgh, 1680, and also reprinted in Guillim, *Display of Heraldry*, 6th ed., London, 1724).

² Sir Bernard Burke, Ulster king of arms, in his *Book of Precedence*, cites 1 Edw. VI. c. 7, an Act "for the Continuance of Actions after the death of any king of this Realm," as a statute bearing on precedence, since, he says, "it enumerates the then names of dignity." But, as the late Sir Charles Young, Garter king of arms, has pointed out in one of his privately printed tracts, the object of the Act was simply to prevent the abatement of suits under certain circumstances, and the names of dignity therein enumerated are enumerated in their wrong order. If the statute of Edward VI. had any effect on precedence, dukes would precede the archbishops, barons the bishops, and knights the judges, which they have never done, and which parliament could never have intended that they should do.

Act "for enabling Lords Commissioners of the Great Seal to execute the office of Lord Chancellor or Lord Keeper" (1 Will. and Mary c. 21) gave to the commissioners not being peers of the realm place next to the speaker of the House of Commons and to the speaker place next to the peers of the realm. In 1707 the Act of Union with Scotland (6 Anne c. 11) provided that all peers of Scotland should be peers of Great Britain¹ and should have rank immediately after the peers of the like degrees in England at the time of the Union and before all peers of Great Britain of the like degrees created after the Union. In 1800 the Act of Union with Ireland (39 and 40 Geo. III. c. 67) provided that the lords spiritual of Ireland should have rank immediately after the lords spiritual of the same degree in Great Britain, and that the lords temporal of Ireland should have rank immediately after the lords temporal of the same degree in Great Britain at the time of the Union, and further that "peerages of Ireland created after the Union should have precedence with peerages of the United Kingdom created after the Union according to the dates of their creation." At different times too during the current century several statutes have been passed for the reform and extension of the judicial organization which have very materially affected the precedence of the judges, more especially the Judicature Act of 1873 (36 and 37 Vict. c. 66), under which the lords justices of appeal and the justices of the High Court now receive their appointments. But the statute of Henry VIII. "for the placing of the Lords" still remains the only legislative measure in which it has been attempted to deal directly and systematically with any large and important section of the scale of general precedence; and the law, so far as it relates to the ranking of the sovereign's immediate kindred whether lineal or collateral, the principal ministers of the crown and court, and both the spiritual and temporal members of the House of Lords, is to all practical intents and purposes what it was made by that statute nearly 350 years ago. Where no Act of parliament applies, precedence is determined either by the will and pleasure of the sovereign or by what is accepted as "ancient usage and established custom." Of the sovereign's will and pleasure the appropriate method of announcement is by warrant under the sign-manual, or letters patent under the great seal. But, although the crown has at all periods very frequently conceded special privileges of rank and place to particular persons, its interference with the scale of general precedence has been rare and exceptional. In 1540 it was provided by warrant from Henry VIII. that certain officers of the household therein named should precede the secretaries of state when and if they were under the degree of barons.² In 1612 James I. directed by letters patent, not without long and elaborate argument in the Star Chamber, that baronets, then newly created, should be ranked after the younger sons of viscounts and barons, and that a number of political and judicial functionaries should be ranked between knights of the Garter and such knights bannerets as should be made by the sovereign in person "under his Standard displayed in an Army Royal in open war."³ Four years later he further directed, also by letters patent, that the sons of baronets and their wives and the daughters of baronets should be placed before the sons of knights and their wives

and the daughters of knights "of what degree or order soever."⁴ And again in 1620 the same king commanded by warrant "after solemn argument before his Majesty" that the younger sons of earls should precede knights of the privy council and knights of the Garter not being "barons or of a higher degree."⁵ If we add to these ordinances the provisions relating to precedence contained in the statutes of several of the orders of knighthood which since then have been instituted or reconstructed, we shall nearly, if not quite, exhaust the catalogue of the interpositions of the sovereign with regard to the rank and place of classes as distinguished from individuals. Of "ancient usage and established custom" the records of the College of Arms furnish the fullest and most trustworthy evidence. Among them in particular there is a collection of early tables of precedence which were published by authority at intervals from the end of the 14th to the end of the 15th century, and to which peculiar weight has been attached by many successive generations of heralds. On them, indeed, as illustrative of and supplementary to the action of parliament and the crown, all subsequent tables of precedence have been in great measure founded. The oldest is the "Order of All Estates of Nobles and Gentry," prepared apparently for the coronation of Henry IV. in 1399, under the supervision of Ralph Nevill, earl of Westmoreland and earl marshal; and the next is the "Order of All States of Worship and Gentry," prepared, as announced in the heading, for the coronation of Henry VI. in 1429, under the supervision of the lord protector Humphrey, duke of Gloucester, and the earl marshal, John Mowbray, duke of Norfolk. Two more are of the reign of Edward IV., and were severally issued by John Tiptoft, earl of Worcester and lord high constable, in 1467, and by Anthony Widvile, Earl Rivers and lord high constable, in 1479. The latest is commonly and shortly known as the "Series Ordinum," and was drawn up by a special commission presided over by Jasper Tudor, duke of Bedford, it is presumed for observance at the marriage of Henry VII. and Elizabeth of York in 1486. To these may be added the "Order for the Placing of Lords and Ladies," taken at a grand entertainment given by command of Henry VIII. at the king's manor-house of Richmond in 1520 by Charles Somerset, earl of Worcester, lord chamberlain of the household, to the French ambassador, Olivier de la Vernade, seigneur de la Bâtie; the "Precedency of All Estates," arranged in 1594 by the commissioners for executing the office of earl marshal; and the "Roll of the King's Majesty's most Royal Proceeding through London" from the Tower to Whitehall on the eve of the coronation of James I., also arranged by the commissioners for executing the office of earl marshal. On many isolated points, too, of more or less importance special declaratory decisions have been from time to time propounded by the earls marshal, their substitutes and deputies; for example, in 1594, when the younger sons of dukes were placed before viscounts; in 1625, when the rank of knights of the Bath and their wives was fixed; and in 1615 and 1677, when the eldest sons of the younger sons of peers were placed before the eldest sons of knights and of baronets. It is from these miscellaneous sources that the precedence among others of all peeresses, the eldest sons and their wives and the daughters of all peers, and the younger sons and their wives of all dukes, marquesses, and earls is ascertained and established. And further, for the purpose of proving continuity of practice and disposing of minor questions not otherwise and more conclusively set at rest, the official programmes and accounts preserved

by the heralds of different public solemnities and processions, such as coronations, royal marriages, state funerals, national thanksgivings, and so on, have always been considered to be of great historical and technical value.¹

1.—General Precedence of Men.

The sovereign; (1) prince of Wales; (2) younger sons of the sovereign; (3) grandsons of the sovereign; (4) brothers of the sovereign; (5) uncles of the sovereign; (6) nephews of the sovereign;² (7) archbishop of Canterbury, primate of all England; (8) lord high chancellor of Great Britain or lord keeper of the great seal; (9) archbishop of York, primate of England;³ (10) lord high treasurer of Great Britain;⁴ (11) lord president of the privy council; (12) lord keeper of the privy seal;⁵ (13) lord great chamberlain of England; (14) lord high constable of England; (15) earl marshal; (16) lord high admiral; (17) lord steward of the household; (18) lord

¹ Selden, *Titles of Honor*, part ii. p. 753.

² The precedence of the members of the royal family depends on their relationship to the reigning sovereign and not on their relationship to any of the predecessors of the reigning sovereign. It is provided by 31 Hen. VIII. c. 10 that no person, "except only the King's children," shall have place "at the side of the Cloth of Estate in the Parliament Chamber," and that "the King's Son, the King's Brother, the King's Nephew, or the King's Brother's or Sister's Sons" shall have place before all prelates, great officers of state, and peers. Lord Chief Justice Coke was of opinion that the king's nephew meant the king's grandson or *nepos* (*Institutes* iv., cap. 77). But, as Mr Justice Blackstone says, "under the description of the King's children his grandsons are held to be included without having recourse to Sir Edward Coke's interpretation of nephew" (*Commentaries*, i. ch. 4). Besides, if grandson is to be understood by nephew, the king's grandson would be placed after the king's brother. The prince of Wales is not specifically mentioned in the statute "for the placing of the Lords"; but, as he is always, whether the son or the grandson of the sovereign, the heir-apparent to the crown, he is ranked next to the sovereign or the queen-consort. With the exception of the prince of Wales, all the male relations of the sovereign are ranked first in the order of their degrees of consanguinity with him or her, and secondly, in the order of their proximity to the succession to the crown; thus the members of the several groups into which the royal family is divided take precedence according to their own seniority and the seniority of their fathers or mothers, the sons of the sons or brothers of the sovereign being preferred to the sons of the daughters or sisters of the sovereign among the sovereign's grandsons and nephews.

³ By 31 Hen. VIII. c. 10, the king's vicegerent "for good and due ministration of justice in all causes and cases touching the ecclesiastical jurisdiction" is placed immediately before the archbishop of Canterbury. The office of vicegerent or vicar-general was then held by Thomas, Lord Cromwell, afterwards earl of Essex, together with that of lord privy seal, and it was never conferred on any other person. By the Act of Union with Ireland the archbishops of Ireland had place next to the archbishops of England, and if consecrated before and not after the disestablishment of the church in Ireland they retain this position under the Irish Church Act of 1869. At the coronation of William IV. the lord chancellor of Ireland walked next after the lord chancellor of Great Britain and before the lord president of the council and lord privy seal. In Ireland, if he is a peer he has precedence between the archbishops of Armagh and Dublin, and if he is not a peer after the archbishop of Dublin. But, except in the House of Lords, the precedence of the lord chancellor of Great Britain or the lord keeper of the great seal is the same whether he is a peer or a commoner. The lord keeper has the same precedence as the lord chancellor under 5 Eliz. c. 18. But the last appointment to the lord keepership was that of Sir Robert Henley, afterwards Lord Henley, lord chancellor, and earl of Northampton, in 1757, and the office is not likely to be revived.

⁴ The last lord high treasurer was Charles Talbot, duke of Shrewsbury, in 1714; since then the office has been executed by commission and as a dignity is practically extinct. None of the commissioners—neither the first lord, who is now always the prime minister, nor any of the other or junior lords—of the treasury have any official precedence whatever.

⁵ The lord president of the council and the lord privy seal, if they are peers, are placed by 31 Hen. VIII. c. 10 before all dukes except dukes related to the sovereign in one or other of the degrees of consanguinity specified in the Act. And, since the holders of these offices have been and are always peers, their proper precedence if they are commoners has never been determined.

chamberlain of the household;⁶ (19) dukes;⁷ (20) mar

⁶ It is provided by 31 Hen. VIII. c. 10 that "the Great Chamberlain, the Constable, the Marshal, the Lord Admiral, the Grand Master or Lord Steward, and the King's Chamberlain shall sit and be placed after the Lord Privy Seal in manner and form following: that is to say, every one of them shall sit and be placed above all other personages being of the same estates or degrees that they shall happen to be of, that is to say the Great Chamberlain first, the Constable next, the Marshal third, the Lord Admiral the fourth, the Grand Master or Lord Steward the fifth, and the King's Chamberlain the sixth." The lord high steward of England is not mentioned in the Act for the placing of the Lords, "because it was intended," Lord Chief Justice Coke says, "that when the use of him should be necessary he should not endure longer than *hac vice*" (*Inst.* iv., 77). But it may be noted that, when his office is called out of abeyance for coronations or trials by the House of Lords, the lord high steward is the greatest of all the great officers of state in England. The office of lord great chamberlain of England is hereditary, and is held jointly during alternate reigns by the heads of the houses of Willoughby de Eresby and Cholmondeley as representing co-heiresses of the Berties, dukes of Ancaster, who derived it from an heiress of the De Veres, earls of Oxford, in whose line it had descended from the reign of Henry I. By a private Act, 1 Geo. I. c. 3, passed previous to the advancement of Robert Bertie, marquess of Lindsey, to the dukedom of Ancaster in 1715, it was provided that the tenure of the great chamberlainship should not give him and his heirs precedence of all other dukes except when in the immediate discharge of the functions of the office; and Sir Bernard Burke still restricts the precedence of the lord great chamberlain to him "when in actual performance of official duty" (*Book of Precedence*, p. 10). But, as Sir Charles Young justly contends, "the limitations of this statute (1 Geo. I. c. 3) failed on the death of the last Duke of Ancaster in 1809 [he should have said "the last duke of Ancaster, who held the great chamberlainship in 1779"], when the precedence of the office of Great Chamberlain fell under the operation of the 31st of Henry VIII." (*Order of Precedence*, p. 20). The office of lord high constable of England is called out of abeyance for and pending coronations only. The office of earl marshal is hereditary in the Howards, dukes of Norfolk, premier dukes and, as earls of Arundel, premier earls of England, under a grant in special tail male from Charles II. in 1672. The office of lord high admiral, like the office of lord high treasurer, is practically extinct as a dignity. Since the reign of Queen Anne there has been only one lord high admiral, namely, William, duke of Clarence, afterwards William IV., for a few months in the Canning administration of 1827. The office is executed by commission, the lords of the admiralty being as destitute of any official precedence as the lords of the treasury, although the first lord of the admiralty is invariably a leading cabinet minister. The lord steward and the lord chamberlain of the household are always peers, and have seldom been under the degree of earls. We may here remark that both the Scottish and Irish Acts of Union make no reference to the precedence of the great officers of state of Scotland and Ireland. Not to mention the prince of Wales, who is by birth steward of Scotland, the earl of Shrewsbury is hereditary great seneschal of Ireland, and the earl of Errol is hereditary lord high constable of Scotland; but what places they are entitled to in the scale of general precedence is altogether doubtful and uncertain. In Ireland the great seneschal ranks after the lord chancellor if he is a commoner, and after the archbishop of Dublin if the lord chancellor is a peer, and in both cases before dukes ("Order of Precedence," *Dublin Gazette*, 3d June 1843). Again, on George IV.'s visit to Edinburgh in 1821 the lord high constable had place as the first subject in Scotland immediately after the members of the royal family. At every coronation from that of George III. to that of Queen Victoria, the lord high constable of Scotland has been placed next to the earl marshal of England, and, although no rank has been assigned on these occasions to the hereditary great seneschal of Ireland, the lord high constable of Ireland appointed for the ceremony has been at all or most of them placed next to the lord high constable of Scotland. It is worthy of notice, however, that Sir George Mackenzie, writing when lord advocate of Scotland in the reign of Charles II., says that "the Constable and Marischal take not place as Officers of the Crown but according to their creation as Earls," and he moreover expresses the opinion that "it seems very strange that these who ride upon the King's right and left hand when he returns from his Parliaments and who guard the Parliament itself, and the Honours, should have no precedence by their offices" (*Observations*, &c., p. 25, in Guillin's *Display of Heraldry*, p. 461 sq.; but see also Wood-Douglas, *Peerage of Scotland*, vol. i. p. 557).

⁷ Both Sir Charles Young and Sir Bernard Burke place "Dukes of the Blood Royal" before dukes, and their eldest sons before marquesses, and their younger sons before marquesses' eldest sons. In the "Ancient Tables of Precedence," which we have already cited, dukes of the blood royal are always ranked before other dukes, and in most of them their eldest sons and in some of them their younger sons are placed in a corresponding order of precedence. But in this connexion the words of the Act for the placing of the Lords are perfectly plain and unambiguous: "All Dukes not aforementioned," i.e., all except only such

queesses; (21) dukes' eldest sons;¹ (22) earls; (23) marquesses' eldest sons; (24) dukes' younger sons; (25) viscounts; (26) earls' eldest sons; (27) marquesses' younger sons; (28) bishops; (29) barons;² (30) speaker of the House of Commons; (31) commissioners of the great seal;³ (32) treasurer of the household; (33) comptroller of the household; (34) master of the horse; (35) vice-chamberlain of the household; (36) secretaries of state;⁴ (37)

as shall happen to be the king's son, the king's brother, the king's uncle, the king's nephew, or the king's brother's or sister's son, "Marquesses, Earls, Viscounts, and Barons, not having any of the offices aforesaid, shall sit and be placed after their anciently as it hath been accustomed." As Lord Chief Justice Coke and Mr Justice Blackstone observe, the degrees of consanguinity with the sovereign to which precedence is given by 31 Hen. VIII. c. 10 are the same as those within which it was made high treason by 28 Hen. VIII. c. 18 for any man to contract marriage without the consent of the king. Queen Victoria, by letters patent under the great seal in 1865, ordained that, "besides the children of Sovereigns of these realms, the children of the sons of any of the Sovereigns of Great Britain and Ireland shall have and at all times hold and enjoy the style or attribute of 'Royal Highness' with their titular dignity of Prince or Princess prefixed to their respective Christian names, or with their other titles of honour." But, notwithstanding this, their rank and place are still governed by the Act for the placing of the Lords. Thus the duke of Cambridge, although he is, as the son of a son of George III., properly designated "Royal Highness" under the letters patent of 1865, has no precedence as the first cousin of the sovereign under the statute of 1539. In the same way the duke of Cumberland has no precedence as the first cousin once removed of Queen Victoria, and being the grandson only of a son of George III. would not be a "Royal Highness" at all if his father had not been, like his grandfather, king of Hanover. In *Garter's Roll of the Lords Spiritual and Temporal*, the official list of the House of Lords, the duke of Cambridge is entered before the archbishop of Canterbury, instead of in the precedence of his dukedom after the duke of Leinster, while the duke of Cumberland is entered in the precedence of his dukedom after the duke of Northumberland. By the etiquette of society, however, both of them are regarded and treated as royal dukes, and even in parliament they are always alluded to not as "noble" but as "illustrious." Under the combined operation of the Act for the placing of the Lords and the Acts of Union with Scotland (art. 23) and with Ireland (art. 4), peers of the same degrees, as dukes, marquesses, earls, viscounts, and barons, severally, have precedence according to priority in the creation of their respective peerages. But peerages of England created before 1707 precede peerages of Scotland created before 1707, peerages of Great Britain created between 1707 and 1801 precede peerages of Ireland created before 1801, and peerages of Ireland created before 1801 precede peerages of the United Kingdom and of Ireland created after 1801, which take precedence in common. The relative precedence of the members of the House of Lords, including the representative peers of Scotland and Ireland, is officially set forth in *Garter's Roll*, which is prepared by the Garter king of arms at the commencement of each session of parliament, that of the Scottish peers generally in the *Union Roll*, and that of the Irish peers generally in *Ulster's Roll*, a record which is under the charge of and is periodically corrected by the Ulster king of arms. The *Union Roll* is founded on the "Decree of Ranking" pronounced and promulgated by a royal commission in 1606, which, in the words of an eminent authority in such matters, "was adopted at once as the roll of the peers in Parliament, convention, and all public meetings, and continued to be called uninterruptedly with such alterations upon it as judgments of the Court of Session upon appeal in modification of the precedence of certain peers rendered necessary, with the omission of such dignities as became extinct and with the addition from time to time of newly created peerages—down to the last sitting of the Scottish Parliament on the 1st May 1707" (*The Earldom of Mar, &c.*, by the earl of Crawford (25th) and Balcarres (8th), vol. ii. p. 16). As the crown was precluded by the Act of Union from creating peerages of Scotland after the Union, all Scottish peers in their several degrees have rank and place before all peers of Great Britain, Ireland, and the United Kingdom.

¹ Eldest sons of peers of any given degree are of the same rank as, but are to be placed immediately after, peers of the first degree under that of their fathers; and the younger sons of peers of any given degree are of the same rank, but are to be placed immediately after peers of the second degree and the eldest sons of peers of the first degree under that of their fathers.

² Secretaries of state, if they are barons, precede all other barons under 31 Hen. VIII. c. 10. But if they are of any higher degree their rank is not influenced by their official position.

³ Under 1 Will. and Mary c. 21, being the only commissioners for the execution of any office who have precedence assigned to them.

⁴ The officers of the household who, under Henry VIII.'s warrant of 1540, precede the secretaries of state have been for a long time

viscounts' eldest sons; (38) earls' younger sons; (39) barons' eldest sons; (40) knights of the Garter;⁵ (41) privy councillors;⁶ (42) chancellor of the exchequer; (43) chancellor of the duchy of Lancaster; (44) lord chief justice of England; (45) master of the rolls; (46) lords justices of appeal;⁷ (47) judges of the High Court of Justice;⁸ (48) knights bannerets made by the sovereign in person; (49) viscounts' younger sons; (50) barons' younger sons; (51) baronets;⁹ (52) knights bannerets not made by the sovereign in person; (53) knights of the first class of the Bath, the Star of India, and St Michael and St George;¹⁰ (54) knights of the second class of the Bath, the Star of India, and St Michael and St George;¹¹ (55) knights bachelors;¹² (56) eldest sons of the younger sons of peers; (57) baronets' eldest sons; (58) knights' eldest sons; (59) baronets' younger sons; (60) knights' younger

always peers or the sons of peers, with personal rank higher, and usually far higher, than their official rank. The practical result is, seeing also that the great seal is only very rarely indeed in commission, that the secretaries of state, when they are commoners whose personal precedence is below a baron's, have official precedence immediately after the speaker of the House of Commons. The principal secretaries, for so they are all designated, are officially equal to one another in dignity, and are placed among themselves according to seniority of appointment.

⁵ During more than two centuries only one commoner has been indebted for his precedence to his election into the order, and that was Sir Robert Walpole, the minister, who at the coronation of George II. in 1727 was placed as a knight of the Garter immediately before privy councillors. The proper precedence of both knights of the Thistle and knights of St Patrick is undecided.

⁶ Privy councillors of Great Britain and of Ireland take precedence in common according to priority of admission. The chancellors of the exchequer and of the duchy of Lancaster, the lord chief justice of England, the master of the rolls, and the lords justices of appeal are always members of the privy council, and have rank and place as privy councillors, if they are not also peers.

⁷ The lords justices of appeal have precedence among themselves according to seniority of appointment. Until recently they were preceded by the lord chief justice of the Common Pleas and the lord chief baron of the Exchequer (divisions of the High Court of Justice). But under existing arrangements these offices have fallen into abeyance, although they have not been formally abolished. The vice-chancellors, used to follow the lords justices of appeal; but, in spite of the fact that there is still one vice-chancellor remaining, the office of vice-chancellor is practically extinct and will altogether disappear on his decease. In Ireland all these offices are in existence; but they have no precedence allotted to them in England; as the judges holding them are invariably privy councillors, however, they are ranked accordingly. And it is the same with regard to the lord justice-general and the lord justice-clerk in Scotland.

⁸ The judges of all the divisions of the High Court of Justice are ranked together according to seniority of appointment. Neither the senators of the College of Justice in Scotland nor the judges of the various divisions of the High Court in Ireland have any precedence in England. The precedence of the Scottish judges among themselves is settled by a royal warrant of 1729, which is printed in full by Nisbet, in his *System of Heraldry* (vol. ii. p. 277). The precedence of the Irish judges among themselves is the same as the precedence of the English judges among themselves used to be before the offices of chief justice of the Common Pleas and chief baron of the Exchequer were suspended.

⁹ It is a question whether baronets ought or ought not to have precedence, like peers, according as they are of England, Scotland, Great Britain, Ireland, or the United Kingdom. Baronets are not referred to in either the Scottish or the Irish Act of Union; and Sir Bernard Burke contends that, since the Acts of Union are silent with regard to them, they are still entitled to whatever precedence was originally conferred on them. He therefore places the whole body of the baronets together in the order merely of the dates of their several creations, and in this he appears to us to have both law and reason on his side.

¹⁰ These knights consist of grand crosses of the first, grand commanders of the second, and grand crosses of the third order, and have precedence in their respective orders according to seniority of creation. By the statutes of the order of the Bath as revised in 1847 it is ordained that the knights grand crosses are to be placed "next to and immediately after baronets," thus superseding knights bannerets not created by the sovereign in person.

¹¹ Knights commanders of all three orders are placed in each order according to seniority of creation.

¹² Knights bachelors are ranked together according to seniority of creation, whether they are made by the sovereign or the lord lieutenant of Ireland.

sons;¹ (61) companions of the Bath, the Star of India, St Michael and St George, and the Indian Empire;² (62) esquires;³ (63) gentlemen.⁴

¹ The sons of all persons, when any specified rank is assigned to them, are placed in the precedence of their fathers. Eldest sons of the younger sons of peers were ranked before the eldest sons of knights by order of the earl marshal, 18th March 1615, and before the eldest sons of baronets by order of the earl marshal, 6th April 1677. But no precedence has been given to the younger sons of the younger sons of peers, although precedence is given to the younger as well as the eldest sons of baronets and knights by James I.'s decree of 1616. Moreover, no precedence has been given to either the eldest or the younger sons of the eldest sons of peers. But in practice this omission is generally disregarded, and the children of the eldest sons of dukes, marquesses, and earls, at all events, are accorded the same rank and titles which they would have if their fathers were actual instead of *quasi* peers of the degree next under that of their grandfathers. Sir Charles Young says that "by decision (Chap. Coll. Arms of 1680) if the eldest son of an Earl died in his father's lifetime leaving a son and heir, such son and heir during the life of the Earl his grandfather is entitled to the same place and precedence as was due to his father: so had the father been summoned to Parliament as the eldest son of a peer the grandson would succeed to the dignity even during the grandfather's lifetime" (*Order of Precedence*, p. 27). And, of course, what applies to the grandson and heir of an earl applies equally to the grandsons and heirs of dukes and marquesses. But the grandsons and heirs of viscounts and barons are differently situated, and have neither honorary additions to their names nor any ascertained place and precedence even by the etiquette of society.

² Companions are members of the third class of the first three orders and the only members of the fourth order, except the sovereign and the grand master. Sir Charles Young and Sir Bernard Burke concur in placing the companions of these orders before the eldest sons of the younger sons of peers, on the ground that under their statutes they are entitled to precede "all Esquires of the Realm." But the sons of peers themselves—the eldest as well as the younger—are merely esquires, and are ranked before, and not among, other esquires because they have a particular precedence of their own assigned to them. Similarly the eldest sons of the younger sons of peers and the eldest sons of baronets and of knights who are also esquires, and likewise the younger sons of baronets and of knights who are not esquires, have a particular precedence of their own assigned to them. All of them are placed before esquires as a specific grade in the scale of general precedence, and it seems clear enough that it is before esquires considered as a specific grade that the companions of the orders ought to be placed and not before any other persons who, whether they are or are not esquires, have a definite and settled rank which is superior to that specific grade in the scale of general precedence.

³ It appears to be admitted on all hands that the following persons are esquires and ought to be so described in all legal documents and processes: first, the eldest sons of peers in the lifetime of their fathers, and the younger sons of peers both in and after the lifetime of their fathers; secondly, the eldest sons of the younger sons of peers and their eldest sons in perpetual succession, and the eldest sons of baronets and knights; thirdly, esquires created with or without the grant of armorial bearings by the sovereign; fourthly, justices of the peace, barristers at law, and mayors of corporations; and fifthly, those who are styled esquires in patents, commissions, or appointments to offices under the crown in the state, the household, the army or navy, and elsewhere. Sir Bernard Burke accords precedence to sergeants at law and masters in lunacy, not only before esquires as such but also before the companions of the orders of knighthood. It is, however, enough to observe with regard to the first, since no more of them are to be created, that, in spite of the extravagant pretensions which have been frequently urged by them and on their behalf, "they have not in the general scale," as Sir Charles Young says, "any precedence, and when under the degree of a Knight rank only as Esquires," and with regard to the second that the statute 8 and 9 Vict. c. 100, on which the Ulster king of arms bases their claims, simply provides that they "shall take the same rank and precedence as the masters in ordinary of the High Court of Chancery," who are now extinct, "apparently," to recur to Sir Charles Young, "assuming the rank of the masters without defining it." "The masters, however," he adds, "as such have not a settled place in the order of general precedence emanating from any authority by statute or otherwise" (*Order of Precedence*, p. 71). Sir William Blackstone says that before esquires "the Heralds rank all Colonels, Sergeants at Law, and Doctors in the three learned professions" (*Commentaries*, i. c. 12). But the only foundation for this statement seems to be a passage in Guillim, which is obviously without any authority.

⁴ The heralds and lawyers are agreed that gentlemen are those who, by inheritance or grant from the crown, are entitled to bear coat armour (see Coke, *Inst.* iv., c. 77; Blackstone, *Comm.*, i. ch. 12; Selden, *Titles of Honor*, pt. ii. ch. 8; Guillim, *Display of Heraldry*, pt. ii. ch. 26).

2.—General Precedence of Women.

The queen;⁵ (1) princess of Wales; (2) daughters of the sovereign; (3) wives of the sovereign's younger sons; (4) granddaughters of the sovereign; (5) wives of the sovereign's grandsons; (6) sisters of the sovereign; (7) wives of the sovereign's brothers; (8) aunts of the sovereign; (9) wives of the sovereign's uncles; (10) nieces of the sovereign; (11) wives of the sovereign's nephews;⁶ (12) duchesses;⁷ (13) marchionesses; (14) wives of the eldest sons of dukes; (15) dukes' daughters;⁸ (16) countesses; (17) wives of the eldest sons of marquesses; (18) marquesses' daughters; (19) wives of the younger sons of dukes; (20) viscountesses; (21) wives of the eldest sons of earls; (22) earls' daughters; (23) wives of the younger sons of marquesses; (24) baronesses; (25) wives of the eldest sons of viscounts; (26) viscounts' daughters; (27) wives of the younger sons of earls; (28) wives of the eldest sons of barons; (29) barons' daughters; (30) maids of honour to the queen;⁹ (31) wives of knights of the Garter; (32) wives of knights bannerets made by the sovereign in person; (33) wives of the younger sons of viscounts; (34) wives of the younger sons of barons; (35) baronets' wives; (36) wives of knights bannerets not made by the sovereign in person; (37) wives of knights grand crosses of the Bath, grand commanders of the Star of India, and grand crosses of St Michael and St George; (38) wives of knights commanders of the Bath, the Star of India, and St Michael and St George; (39) knights bachelors' wives; (40) wives of the eldest sons of the younger sons of peers; (41) daughters of the younger sons of peers; (42) wives of the eldest sons of baronets; (43) baronets' daughters; (44) wives of the eldest sons of knights; (45) knights' daughters; (46) wives of the younger sons of baronets; (47) wives of the younger sons of knights;¹⁰ (48) wives of companions of the Bath, the Star of India, St Michael and St George, and the Indian Empire; (49) wives of esquires;¹¹ (50) gentlewomen.¹²

⁵ The queen-consort is the second personage in the realm, and has precedence of the queen-dowager. But the husband of a reigning queen has no rank or place except such as is specially accorded to him by the sovereign.

⁶ There is no Act of parliament or ordinance of the crown regulating the precedence of the female members of the royal family. But the above is the gradation which appears to have become established among them, and follows the analogy supplied by the Act for the placing of the Lords in the case of their husbands and brothers.

⁷ Peeresses in their own right and peeresses by marriage are ranked together, the first in their own precedence and the second in the precedence of their husbands.

⁸ Among the daughters of peers there is no distinction between the eldest and the younger as there is among the sons of peers. Their precedence is immediately after the wives of their eldest brothers, and several degrees above the wives of their younger brothers. They are placed among themselves in the precedence of their fathers. But the daughter of the premier duke or baron ranks after the wife of the eldest son of the junior duke or baron.

⁹ Maids of honour to the queen are the only women who have any official precedence. They have the style or title of honourable, and are placed immediately after barons' daughters by Sir Bernard Burke, the rank which is accorded to them by the etiquette of society. But Sir Charles Young does not assign any precedence to them, and we do not know on what authority the Ulster king of arms does so, although he is by no means singular in the course he has taken.

¹⁰ The wives of baronets and knights, the wives of the eldest sons and the daughters of the younger sons of peers, and the wives of the sons and the daughters of baronets and knights are all placed severally in the precedence of their respective husbands, husbands' fathers, and fathers.

¹¹ "Esquire" and "gentleman" are not names of "dignity" but names of "worship," and esquires and gentlemen do not, in strictness, convey or transmit any precedence to their wives or children (see Coke, *Inst.* ii., "Of Additions," p. 667).

¹² "And *generous* and *generosa* are good additions: and if a gentleman be named Spinster in any original writ, *i.e.*, appeal or indictment, she may abate and quash the same, for she hath as good right to that addition as Baroness, Viscountess, Marchioness, or Duchess have to theirs" (Coke, *Inst.* ii., "Of Additions," p. 668).

Attention to the foregoing tables will show that general precedence is of different kinds as well as of several degrees. It is first either personal or official, and secondly either substantive or derivative. Personal precedence belongs to the royal family, the peerage, and certain specified classes of the commonalty. Official precedence belongs to such of the dignitaries of the church and such of the ministers of state and the household as have had rank and place accorded to them by parliament or the crown, to the speaker of the House of Commons, and to the members of the privy council and the judicature. Substantive precedence, which may be either personal or official, belongs to all those whose rank and place are enjoyed by them independently of their connexion with anybody else, as by the archbishop of Canterbury, the lord high chancellor or the lord great chamberlain, peers and peeresses, baronets, knights, and some esquires. Derivative precedence, which can only be personal, belongs to all those whose rank and place are determined by their consanguinity with or affinity to somebody else, as the lineal and collateral relations of the sovereign, the sons, daughters, and daughters-in-law of peers and peeresses in their own right, and the wives, sons, daughters, and daughters-in-law of baronets, knights, and some esquires. It is to be observed, however, that the precedence of the sovereign is at once official and personal, and that the precedence of peeresses by marriage is at once derivative and substantive. In the case of the sovereign it is his or her actual tenure of the office of king or queen which regulates the rank and place of the various members of the royal family, and in the case of peeresses by marriage, although their rank and place are derivative in origin, yet they are substantive in continuance, since during coverture and widowhood peeresses by marriage are as much peeresses as peeresses in their own right, and their legal and political status is precisely the same as if they had acquired it by creation or inheritance.

Bearing the above definitions and explanations in mind, the following canons or rules may be found practically useful.

1. Anybody who is entitled to both personal and official precedence is to be placed according to that which implies the higher rank. If, for example, a baron and a baronet are both privy councillors, the precedence of the first is that of a baron and the precedence of the second is that of a privy councillor. And similarly, except as hereafter stated, with respect to the holders of two or more personal or two or more official dignities.

2. Save in the case of the sovereign, official rank can never supply the foundation for derivative rank. Hence the official precedence of a husband or father affords no indication of the personal precedence of his wife or children. The wives and children, for example, of the archbishop of Canterbury, the lord high chancellor, or the speaker of the House of Commons do not participate in their official rank but only in their personal rank whatever it may be.

3. Among subjects men alone can convey derivative rank, except in the case of the daughters and sisters of the sovereign, or of peeresses in their own right. But no man can acquire any rank or place by marriage. The sons-in-law or brothers-in-law of the sovereign and the husbands of peeresses in their own right have as such no precedence whatever. And the daughter and heiress of the premier duke of England, unless she happens to be also a peeress in her own right, does not transmit any rank or place to her children.

4. Within the limits of the peerage derivative rank is as a rule always merged in personal, as distinguished from official, substantive rank. If, for example, the younger son of a duke is created a baron or inherits a barony, his precedence ceases to be that of a duke's younger son and becomes that of a baron. But, where the eldest son of a duke, a marquess, or an earl is summoned to the House of Lords in a barony of his father's, or succeeds as or is created a baron, he is still, as before, "commonly called" by some superior title of peerage, as marquess, earl, or viscount, and retains his derivative precedence on all occasions, except in parliament or at ceremonies which he attends in his character as a peer. The younger sons of all peers, however, who are created or who inherit peerages—which they often do under special limitations—are everywhere placed according to their substantive rank, no matter how inferior it may be to their derivative rank. But if the son of a duke or a marquess, whether eldest or younger, or the eldest son of an earl is consecrated a bishop his derivative rank is not merged

in his substantive rank, because it is official, and his derivative and personal rank implies the higher precedence. Again, the daughters of dukes, marquesses, and earls who become peeresses by marriage or creation, or who inherit as peeresses, are placed according to their substantive and not according to their derivative rank, although they may thereby be assigned a far lower precedence than that to which their birth entitles them.

5. The widows of peers and baronets have precedence immediately before the wives or widows of the next successors in their husbands' dignities. But the sons and daughters of peers and baronets have precedence immediately before the sons and daughters of the holders of the dignities to whom their fathers succeeded. The reason of this is that the first are senior in the dignities and the second are nearer in the line of succession to them.

6. The widows of peers who marry again either share the precedence of their second husbands or resume the precedence belonging to them independently of their marriage with their first husbands. Thus, if the daughter of a duke or an esquire marries first an earl and secondly a baron, although she remains a peeress, she is placed as a baroness instead of a countess. But if either of them should marry a commoner as her second husband, whatever may be his rank or degree, she ceases to be a peeress. While, however, the duke's daughter, if her second husband were not the eldest son of a duke, would resume her precedence as the daughter of a duke, the esquire's daughter would share the precedence of her second husband, whether he were a peer's son, a baronet, a knight, or an esquire. By the etiquette of society, however, the widows of peers who marry again do not forfeit the titles and precedence acquired by their marriage with their first husbands unless they choose to lay them aside, or unless their own rank or the rank of their second husbands is equal or superior to that of their first husbands.

7. The widows of the eldest and younger sons of dukes and marquesses and of the eldest sons of earls, and also the widows of baronets and knights who marry again, are permitted by the etiquette of society to keep the titles and rank acquired by their first marriage if their second marriage is with a commoner whose precedence is considerably lower. But the widows of the younger sons of earls and of the eldest and younger sons of viscounts and barons, although their precedence is higher than that of the widows of baronets and knights, are not allowed to retain it, under any circumstances, after a second marriage.

8. Marriage does not affect the precedence of peeresses in their own right unless their husbands are peers whose peerages are of a higher degree, or, being of the same degree, are of more ancient creation than their own. If, for example, a baroness in her own right marries a viscount she is placed and described as a viscountess, or if she marries a baron whose barony is older than hers she is placed in his precedence and described by his title. But if she marries a baron whose barony is junior to hers she keeps her own precedence and title.

9. The daughters of peers, of sons of peers, baronets, and knights retain after marriage the precedence they derive from their fathers, unless they marry peers of any rank or commoners of higher rank than their own. Hence, for example, the daughter of a duke who marries the eldest son of a marquess is placed as a duke's daughter, not as the wife of a marquess's eldest son, and the daughter of a baronet who marries the younger son of a knight is placed as a baronet's daughter and not as the wife of a knight's younger son.

10. What are termed "titles of courtesy" are borne by all the sons and daughters of peers and peeresses in their own right, who in this connexion stand on exactly the same footing. The eldest sons of dukes, marquesses, and earls are designated by the names of one or other of the inferior peerages of their fathers, usually a marquessate or an earldom in the first, an earldom or a viscounty in the second, and a viscounty or barony in the third case. But, whatever it may be, it is altogether without effect on the rank and place of the bearer, which are those belonging to him as the eldest son of his father. The younger sons of dukes and marquesses are styled "lords" followed by both their Christian names and surnames. The younger sons of earls and both the eldest and the younger sons of viscounts and barons are described as "honourable" before both their Christian names and surnames. The daughters of dukes, marquesses, and earls are styled "ladies" before both their Christian names and surnames. The daughters of viscounts and barons are described as "honourable" before both their Christian names and surnames. If the eldest son of a marquess or an earl marries a woman of rank equal or inferior to his own, she takes his title and precedence; but if she is of superior rank she retains, with her own precedence, the prefix "lady" before her Christian name followed by the name of her husband's title of courtesy. Again, if the younger son of a duke or a marquess marries a woman of rank equal or inferior to his own, she is called "lady," with his Christian and surname following, and is placed in his precedence; but, if she is of superior rank, she retains, with her own precedence, the prefix "lady" before her Christian name and his surname. If the daughter of a duke, a marquess, or an earl

marries the younger son of an earl, the eldest or younger son of a viscount or baron, a baronet, a knight, or an esquire, &c., she retains, with her own precedence, the prefix "lady" before her Christian name and her husband's surname. If the daughter of a viscount marries the younger son of an earl or anybody of inferior rank to him, or the daughter of a baron marries the younger son of a viscount or anybody of inferior rank to him, she retains her own precedence with the prefix "honourable" before the addition "Mrs" and his surname or Christian name and surname. But, if her husband is a baronet or a knight, she is called the Honourable Lady Smith or the Honourable Lady Jones, as the case may be. The wives of the younger sons of earls and of the eldest and younger sons of viscounts and barons, if they are of inferior rank to their husbands, take their precedence and are described as the Honourable Mrs, with the surnames or Christian names and surnames of their husbands following. It was because the judges were placed by James I. before the younger sons of viscounts and barons that they were accorded the title of "honourable," and that they are designated as the Honourable Mr Justice Hawkins or the Honourable Mr Justice Stephen, instead of as Sir Henry Hawkins or Sir James Stephen, which would connote their inferior personal dignity of knighthood. But in this addition their wives do not participate, since it is merely an official distinction.

It is manifest on even a cursory examination of the tables we have given that, although they embody the only scheme of general precedence, whether for men or for women, which is authoritatively sanctioned or recognized, they are in many respects very imperfectly fitted to meet the circumstances and requirements of the present day. In both of them the limits prescribed to the royal family are pedantically and inconveniently narrow, and stand out in striking contrast to the wide and ample bounds through which the operation of the Royal Marriage Act (12 Geo. III. c. 11) extends the disabilities but not the privileges of the sovereign's kindred. Otherwise the scale of general precedence for women compares favourably enough with the scale of general precedence for men. If, indeed, it includes the queen's maids of honour and the wives of the companions of the knightly orders, there certainly does not seem to be any good reason why it should omit the mistress of the robes and the ladies of the bedchamber, or the ladies of the royal order of Victoria and Albert and the imperial order of the Crown of India. But these are trifling matters in themselves, and concern only an extremely minute fraction of the community. The scale of general precedence for men is now in substantially the same condition as that in which it has been for between two and three centuries, and the political, to say nothing of the social, arrangements to which it was framed to apply have in the interval undergone an almost complete transformation. The consequence is that a good deal of it has come down to us in the shape of a survival, and has ceased to be of any practical use for the purpose it was originally designed to effect. While it comprises several official and personal dignities which are virtually obsolete and extinguished, it entirely omits the great majority of the members of Government in its existing form, and whole sections of society on a less exalted level, to whom it is universally felt that some rank and place at all events are both in public and in private justly due.

As we have already said, it accords no precedence whatever to the prime minister, whether as premier or as first lord of the treasury. In the same way it ignores not only the first lord of the admiralty but also the presidents of the Board of Trade and the Local Government Board, the postmaster-general, the vice-president of the council, and all the law officers of the crown.¹ And, when it does confess the

presence of any of the sovereign's principal ministers, it commonly places them in positions which are out of all keeping with their actual eminence and importance. It ranks the lord president of the council and the lord privy seal before dukes, while it places the chancellor of the exchequer after the younger sons of earls and the eldest sons of barons, and the secretaries of state after the master of the horse and the vice-chamberlain of the household. The lord chancellor still has precedence as the first of the great officers of state, which was allotted to him not as what he is, the head of the judicature, but as what he once was, the prime minister of the sovereign; and the lord chief justice, who is next to him in regular judicial rank, as presiding over the Common Law Courts, as he presides over the Courts of Equity, is placed after the chancellors of the exchequer and of the duchy of Lancaster, who still have the precedence which was allotted to them not as ministers, which they are, but as judges, which they are no longer. Neither the lord lieutenant of Ireland, the viceroy of India, nor the governor-general of Canada has any rank or place at St James's, where, as well as at Westminster, the lord steward or the lord chamberlain of the household is a much greater and more splendid personage. Again, in the scale of general precedence there are no clergymen except bishops, no lawyers except judges, and no officers of either the army or the navy from field-marshal and admirals of the fleet downwards. Nor, of course, are any colonial governors or lieutenant-governors entered on it. It contains no mention of under-secretaries of state, chairmen or commissioners of administrative boards, comptrollers or secretaries of Government departments, lord lieutenants or sheriffs of counties, deputy lieutenants or justices of the peace, members of the House of Commons, or graduates of the universities. It is true that among some of these classes definite systems of subordination are established by either authority or usage, which are carefully observed and enforced in the particular areas and spheres to which they have reference. But we have seldom any means of determining the relative value of a given term in one series as compared with a given term in another series, or of connecting the different steps in the scales of local, professional, or academical precedence with the different steps in the scale of general precedence, to which such scales of special precedence ought to be contributory and supplementary. We know, for example, that major-generals and rear-admirals are of equal rank, that with them are placed commissaries-general and inspectors-general of hospitals and fleets, that in India along with civilians of thirty-one years' standing they immediately follow the vice-chancellors of the Indian universities, and that in relation to the consular service they immediately precede agents-general and consuls-general. But there is nothing to aid us in determining whether in England they should be ranked with, before, or after deans, queen's counsel, or doctors in divinity, who are as destitute as they are themselves of any recognized general precedence, and who, as matters now stand, would certainly have to give place to the younger sons of baronets and knights and the companions of the knightly orders.

The subjoined tables of special precedence, although their authority would not always be admitted in the Col-

has in such cases become established. This applies, for instance, to the places of the Gentlemen of the Privy Chamber, Law Officers of the Crown, and Masters and Six Clerks in Chancery, who have no definite or fixed place in the tables of precedence regulating the general orders of society, though in reference to State ceremonials they have certain places assigned in the order of procession in right of their offices, which, however, give them no general rank. Upon such occasions, nevertheless, the legal rank and precedence which they hold in the Courts of Law is observed, and so far establishes among themselves, and in respect to their several classes, their precedence" (Sir Charles Young, *Order of Precedence, &c.*, pp. 59-61).

¹ "There are no doubt certain public ceremonials of State, such as Coronations, Royal Public Funerals, and Processions of the Sovereign to Parliament, &c., wherein various public functionaries walk and have for the occasion certain places assigned to them, but which they may not at all times find the same, as it by no means follows that they are always entitled to the same place for having been there once: there is to a certain extent a precedent furnished thereby, and in some cases the uniformity of precedence in regard to one class over another

lege of Arms, may perhaps assist towards the solution of some of the problems which occasionally arise in ordinary society.

1. *Ecclesiastical Precedence.*—(1) Archbishop of Canterbury; (2) archbishop of York; (3) archbishop of Armagh; (4) archbishop of Dublin; (5) bishop of London; (6) bishop of Durham; (7) bishop of Winchester; (8) other bishops of England; (9) bishop of Meath; (10) other bishops of Ireland; (11) suffragan bishops of England; (12) bishop of Sodor and Man; (13) bishops of Scotland; (14) colonial bishops; (15) deans of cathedrals; (16) archdeacons; (17) canons; (18) rural deans; (19) rectors; (20) vicars; (21) curates.

2. *Legal Precedence.*—(1) Lord chancellor of Great Britain; (2) lord chancellor of Ireland; (3) lords of appeal in ordinary in the House of Lords; (4) members of the judicial committee of the privy council; (5) lord chief justice of England; (6) lord justice-general and president of the Court of Session of Scotland; (7) lord chief justice of Ireland; (8) master of the rolls in England; (9) lord justice-clerk and president of the second division of the Court of Session of Scotland; (10) master of the rolls in Ireland; (11) lords justices of appeal in England; (12) lords chief justice of the Common Pleas, chief baron of the Exchequer, and justices of appeal in Ireland; (13) vice-chancellor in England; (14) vice-chancellor in Ireland; (15) judges of the High Court of Justice in England; (16) senators of the College of Justice in Scotland; (17) judges of the High Court of Justice in Ireland; (18) attorney-general for England; (19) lord advocate of Scotland; (20) attorney-general for Ireland; (21) solicitor-general for England; (22) solicitor-general for Scotland; (23) solicitor-general for Ireland; (24) queen's counsel; (25) serjeants-at-law; (26) masters in lunacy; (27) recorder of London; (28) treasurers of the Inns of Court; (29) dean of the faculty in Scotland; (30) barristers; (31) advocates; (32) president of the Incorporated Law Society; (33) solicitors; (34) writers to the signet; (35) writers.

3. *Military Precedence.*—(1) Field-marshal; (2) generals; (3) lieutenant-generals; (4) major-generals, inspectors-general of hospitals after three years' service or with an army in the field, and commissaries-general; (5) brigadier-generals, deputy paymasters-general, and inspectors-general of hospitals of under three years' service and not with an army in the field; (6) colonels, deputy judge advocate, and deputy inspectors-general of hospitals after five years' service; (7) lieutenant-colonels, deputy commissaries-general after five years' service, deputy inspectors-general of hospitals, and surgeon-majors; (8) majors, deputy commissaries-general under five years' service, assistant commissaries-general, inspectors of army accounts, staff or regimental surgeons, chaplains attached to brigades, deputy judge advocates if not at the head of their department, storekeepers of the ordnance, and barrack masters of the first and second classes; (9) captains, deputy assistant commissaries-general, assistant deputy paymasters-general, regimental paymasters, principal examiner of military accounts, staff or regimental assistant surgeons after ten years' service, veterinary surgeons after twenty years' service, chaplains attached to regiments, deputy storekeepers of the ordnance, and barrack masters of the third and fourth classes; (10) lieutenants, acting deputy assistant commissaries-general, examiners of military accounts, assistant surgeons, apothecaries of less than fifteen years' service, deputy medical purveyors, and veterinary surgeons after ten years' service; (11) second lieutenants, commissariat clerks, clerks in the paymaster-general's and military accounts departments, medical and ordnance clerks, and veterinary surgeons under ten years' service; (12) superintending schoolmasters.

4. *Naval Precedence.*—(1) Admirals of the fleet; (2) admirals; (3) vice-admirals; (4) rear-admirals and inspectors-general of hospitals and fleets; (5) commodores; (6) captains of over three years' seniority, deputy inspectors-general of hospitals and fleets, secretaries to admirals of the fleet, paymaster-in-chief, chief inspectors of machinery, and inspectors of machinery of eight years' standing; (7) captains of under three years' seniority; (8) staff captains, secretaries to commanders-in-chief of five years' standing, and inspectors of machinery of under eight years' standing; (9) commanders; (10) staff commanders, fleet surgeons, secretaries to commanders-in-chief of under five years' standing, paymasters of fifteen years', chief engineers of ten, and naval instructors of fifteen years' standing; (11) lieutenants of eight years' seniority; (12) navigating lieutenants of eight years' seniority, staff surgeons, secretaries to junior flag officers, paymasters of eight, naval instructors of eight, and chief engineers of under ten years' standing; (13) lieutenants of under eight years' seniority; (14) navigating lieutenants of under eight years' seniority, surgeons, secretaries to commodores of the second class, paymasters and naval instructors of under eight and assistant paymasters and engineers of over eight years' standing; (15) sub-lieutenants; (16) navigating sub-lieutenants, assistant paymasters and engineers of under eight years' standing, chief carpenters, and assistant engineers; (17) chief gunners and chief boatswains; (18) gunners, boatswains, and carpenters; (19) midshipmen and clerks; (20) naval cadets and assistant clerks.

5. *Relative Military and Naval Precedence.*—(1) Field-marshal with admirals of the fleet; (2) generals with admirals; (3) lieutenant-generals with vice-admirals; (4) major-generals with rear-admirals; (5) brigadier-generals with commodores; (6) colonels with captains of over three years' seniority; (7) lieutenant-colonels with captains of under three years' seniority and staff captains, and before commanders and staff commanders; (8) majors with lieutenants and navigating lieutenants of eight years' seniority; (9) captains with lieutenants and navigating lieutenants of under eight years' seniority; (10) lieutenants with sub-lieutenants and navigating sub-lieutenants; (11) second lieutenants with midshipmen.

6. *Diplomatic and Consular Precedence.*—(1) Ambassadors immediately after the royal family and the sons and brothers of sovereigns, and before archbishops, great officers of state, and dukes; (2) envoys and ministers accredited to the sovereign after dukes and before marquesses; (3) chargés d'affaires who are accredited, not to the sovereign, but to the minister of foreign affairs, have no recognized general precedence; (4) military or naval attachés of higher rank than colonel in the army or captain in the navy, next to the head of the mission; (5) agents-general and consuls-general with but after major-generals and rear-admirals; (6) consuls-general with but after brigadier-generals and commodores; (7) secretaries of embassy; (8) secretaries of legation; (9) military or naval attachés of or under the rank of colonel in the army or captain in the navy, next to the secretary of embassy or legation; (10) consuls with but after colonels in the army and captains in the navy; (11) second secretaries of embassy; (12) second secretaries of legation; (13) vice-consuls with but after majors in the army and lieutenants in the navy of eight years' seniority; (14) third secretaries of embassy; (15) third secretaries of legation; (16) consular agents with but after captains in the army and lieutenants in the navy of under eight years' seniority; (17) attachés.

7. *Colonial Precedence generally.*—(1) The governor or lieutenant-governor or officer administering the government; (2) general in command of the troops and admiral in command of the naval forces; (3) the bishop; (4) the chief justice; (5) colonel or lieutenant-colonel in command of the troops and the officer of equivalent rank in command of the naval forces; (6) members of the

executive council; (7) president of the legislative council; (8) members of the legislative council; (9) speaker of the house of assembly; (10) puisne judges; (11) members of the house of assembly; (12) colonial secretary not being in the executive council; (13) commissioners or Government agents of provinces or districts; (14) attorney-general; (15) solicitor-general; (16) major or other senior officer in command of the troops and the officer of equivalent rank in command of the naval forces; (17) the archdeacon; (18) treasurer, paymaster-general, or collector of internal revenue; (19) auditor-general or inspector of general accounts; (20) commissioner of crown lands; (21) collector of customs; (22) comptroller of customs; (23) surveyor-general; (24) clerk of the executive council; (25) clerk of the legislative council; (26) clerk of the house of assembly.

8. *Precedence in the Dominion of Canada.*—(1) The governor-general or officer administering the government; (2) general commanding the troops and admiral commanding the naval forces; (3) lieutenant-governor of Ontario; (4) lieutenant-governor of Quebec; (5) lieutenant-governor of Nova Scotia; (6) lieutenant-governor of New Brunswick; (7) archbishops and bishops; (8) members of the cabinet; (9) speaker of the house; (10) chief judges of the courts of law and equity; (11) members of the privy council; (12) generals and admirals not in chief command; (13) colonel in command of the troops and naval officer of equivalent rank in command of the naval forces; (14) members of the Senate; (15) speaker of the House of Commons; (16) puisne judges; (17) members of the House of Commons; (18) members of provincial executive councils within their province; (19) speaker of legislative councils within his province; (20) members of legislative councils within their province; (21) speaker of legislative assemblies within his province; (22) members of legislative assemblies within their province.

9. *Precedence in the Indian Empire.*—(1) Governor-general and viceroy of India; (2) governors of Madras and Bombay; (3) president of the council of the governor-general; (4) lieutenant-governors of Bengal, the North-West Provinces, and the Punjab when in their own territories; (5) commander-in-chief in India; (6) lieutenant-governors of Bengal, the North-West Provinces, and the Punjab; (7) chief justice of Bengal; (8) bishop of Calcutta, metropolitan of India; (9) ordinary members of the council of the governor-general; (10) commanders-in-chief in Madras and Bombay; (11) commander-in-chief of the naval forces unless senior in relative rank to the above; (12) chief justices of Madras, Bombay, and the North-West Provinces; (13) bishops of Madras and Bombay; (14) ordinary members of council in Madras and Bombay; (15) chief commissioners and resident at Hyderabad and agents to the governor-general in Rajputana, Central India, and Baroda; (16) puisne judges of the High Courts of Calcutta, Madras, Bombay, and the North-West Provinces; (17) military officers above major-generals; (18) additional members of the councils of the governor-general; (19) secretaries to the Government of India; (20) commissioner in Sind; (21) judges of the Chief Court in the Punjab; (22) additional members of the councils of the governors of Madras and Bombay; (23) chief secretaries to the Governments of Madras and Bombay; (24) members of the legislative council of the lieutenant-governor of Bengal; (25) vice-chancellors of Indian universities. *First class:* (26) civilians of thirty-one years' standing and major-generals; (27) advocate-general, Calcutta; (28) advocates-general, Madras and Bombay; (29) members of the boards of revenue, Bengal, Madras, and the North-West Provinces, and commissioners of revenue and customs, Bombay; (30) financial commissioner, Punjab; (31) judicial commissioners and recorder of Rangoon; (32) comptroller-general of accounts in India; (33) commissioners of divisions within their own divisions, and residents, political agents, and superintendents, on pay of Rs.2000 per mensem or more (not being collectors or deputy commissioners of British districts), within their own charges; (34) civil and military secretaries to Governments of Madras and Bombay, and civil secretaries to Governments of Bengal, North-West Provinces, and Punjab; (35) surveyor-general of India, and directors-general of the post-office and of telegraphs; (36) chief engineers, first class; (37) archdeacons of Calcutta, Madras, and Bombay; (38) brigadier-generals. *Second class:* (39) civilians of twenty-three years' standing and colonels; (40) commissioners of divisions, and commissioners of police, Calcutta; (41) private secretary to the viceroy; (42) residents, political agents, and superintendents on pay of Rs.2000 per mensem or more (not being collectors or deputy commissioners of British districts); (43) superintendent of the trigonometrical survey; (44) commissioner of inland customs; (45) sanitary commissioner of the Government of India; (46) superintendent of the Geological Survey; (47) inspector-general of forests in India; (48) standing council to the Government of India; (49) military accountant-general; (50) directors of public instruction under local governments; (51) accountant-general for local governments; (52) inspectors-general of police under local governments; (53) director of revenue settlement and superintendent of revenue survey, Madras, survey and settlement commissioners, Bombay, and commissioner of settlements, Punjab; (54) remembrancers of legal affairs and Government advocates in the North-West Provinces, the Punjab, and British Burma; (55) consulting engineers to the Government of India for guaranteed railways, Calcutta and Lahore, and chief engineers (second and third classes) under local governments; (56) district and sessions judges, collectors and magistrates of districts, deputy superintendent of Port Blair, and the chief officer of each presidency municipality, within their respective charges; (57) officers of the first class graded list of civil offices not reserved for members of the Covenanted Civil Service. *Third class:* (58) civilians of eighteen years' standing and lieutenant-colonels; (59) political agents and superintendents on pay of Rs.1000 and less than Rs.2000 per mensem (not being collectors or deputy commissioners in British districts) within their own charges; (60) military secretary to the Government, Punjab, and civil secretaries to local administrations; (61) private secretaries to governors; (62) directors of public instruction under local administrations; (63) administrators-general, Calcutta, Madras, and Bombay; (64) inspectors-general of jails and of registration, sanitary commissioners, inspectors, and conservators of forests under local governments, and postmasters-general; (65) accountants-general for local administrations; (66) consulting engineer to the Government of India for guaranteed railways, Lucknow, and chief and superintending engineers when secretaries to local administrations or to agents to the governor-general; (67) inspectors-general of police under local administrations; (68) senior chaplains; (69) superintendent of marine, Bombay; (70) master attendants; (71) sheriffs within their own charges; (72) officers in the second class graded list of civil offices not reserved for members of the Covenanted Civil Service. *Fourth class:* (73) civilians of twelve years' standing and majors; (74) political agents and superintendents of less than Rs.1000 per mensem within their own charges; (75) Government solicitors; (76) inspectors-general of jails and of registration, sanitary commissioners, and conservators of forests under local administrations; (77) officers in the third class graded list of civil offices not reserved for members of the Covenanted Civil Service.²

2 "All ladies to take place according to the rank herein assigned to their respective husbands, with the exception of wives of Peers and of ladies having precedence in England independently of their husbands and who are not in rank below the daughters of Barons, such ladies to take place according to their several ranks with reference to such precedence in England immediately after the wives of members of council at the presidencies in India" (*Royal Warrant*, 18th October 1876).

1 Town or fort majors, if officers under the rank of captain, rank as the junior captains in the garrison, and apothecaries after fifteen years' service rank immediately before lieutenants.

10. *Academical Precedence*.—(1) Chancellors; (2) high stewards; (3) vice-chancellors; (4) rectors; (5) principals; (6) heads of colleges and halls; (7) doctors of divinity; (8) doctors of law; (9) doctors of medicine; (10) doctors of music; (11) bachelors of divinity; (12) proctors; (13) professors; (14) masters of law; (15) masters of arts; (16) bachelors of law; (17) bachelors of medicine; (18) bachelors of music; (19) bachelors of arts. Offices in the universities are more or less different in each of them, and those which are peculiar to any one vary so much from those which are peculiar to the others that it is not convenient to enumerate and distinguish them. Among graduates of all of them the senior take precedence of the junior according to their several faculties and degrees and the relative antiquity of their universities in the order of Oxford, Cambridge, St Andrews, Glasgow, Aberdeen, Edinburgh, Dublin, London, Durham, Queen's, Sydney, Melbourne, Catholic, Royal, and Victoria. (F. D.R.)

PREDESTINATION is a theological term, sometimes used with greater latitude to denote the decree or purpose of God by which He has from eternity immutably determined whatever comes to pass; sometimes more strictly to denote the decree by which men are destined to everlasting happiness or misery; and sometimes with excessive strictness to denote only predestination to life or election.¹

The question to which the theory of predestination supplies an answer, although it has a special interest to Christian thought, yet arises in all minds which are occupied with the problems of human existence. That question is, To what cause can we refer the diversities in human character, fortunes, and destiny? The Greek tragedians made it their business to exhibit the helplessness of man in his strife against fate. Sometimes indeed they explicitly distinguish fate from a mere pitiless and non-moral sovereignty and identify it with the Nemesis which pursues hereditary or individual guilt; and sometimes—as in the case of *Œdipus*—they follow the history of the sufferer for the sake of showing how the predestined and inevitable transgression and punishment educate the character. But the idea which fascinates and pursues them is that man cannot escape his destiny, that his life is woven with a “shuttle of adamant,” and that when God means to destroy a man He makes evil seem good to him (*Soph., Antig., 622-24*). The Greek philosophy tended in the same direction; and the Stoic doctrine of necessity or providence, though based on a broad and thoroughly philosophical view of nature and of man's place in it, was entangled in the very difficulties which attach to Calvinism.

Among the Jews the Sadducees carried their defence of free will so far as to deny predestination; while the

Pharisees and Essenes ran to the other extreme and left no place for human freedom (Josephus, *Antiq.*, xviii. 1, 3, 4; xiii. 5, 9).

In Islam the subject of predestination has produced endless controversy. The orthodox doctrine is thus stated by Al-Berkevi. “It is necessary to confess that good and evil take place by the predestination and predetermination of God, that all that has been and all that will be was decreed in eternity and written on the *preserved table*; that the faith of the believer, the piety of the pious, and their good actions are foreseen, willed, predestinated, decreed by the writing on the preserved table produced and approved by God: that the unbelief of the unbeliever, the impiety of the impious, and bad actions come to pass with the foreknowledge, will, predestination, and decree of God, but not with His satisfaction and approval. Should any ask why God willeth and produceth evil, we can only reply that He may have wise ends in view which we cannot comprehend.” Some Mohammedan teachers (disciples of Al-Ash'ari) endeavour to maintain the consistency of this doctrine with man's freedom and responsibility; but practically the Sunnite or orthodox Mohammedans believe that by the force of God's eternal decree man is constrained to act thus or thus. From this there has resulted, on the one hand, the Epicurean pessimism of 'Omar Khayyám—

“’Tis all a chequer-board of nights and days
Where destiny with men for pieces plays:
Hither and thither moves, and mates, and slays,
And one by one back in the closet lays”—

or the weak recklessness of the poet Faizi: “Before thou and I were thought of, our freewill was taken from us; be without cares for the Maker of both worlds settled our affairs long before we were made.” On the other hand, there has resulted the freethinking (Mō'tazilite) reaction, to which the Shiah's incline and which rehabilitates freewill at the expense of the divine sovereignty.

Within the Christian church there have in like manner always existed two opposed beliefs regarding predestination, which have received their ultimate development and expression in the Calvinistic and Arminian systems respectively. The Calvinistic doctrine of predestination is that “from all eternity God chose or elected some men—certain definite persons of the human race—to everlasting life; that He decreed or determined certainly and infallibly, and not conditionally and mutably, to bring those persons to salvation by a Redeemer; that in making this selection of some men, and in decreeing to save *them*, He was not influenced or determined by anything existing in them or foreseen in them—such as faith or good works—by which they were distinguished from other men, or by anything out of Himself, or by any reason known to us or comprehensible by us; and that this eternal purpose or decree He certainly and infallibly executes, in regard to each and every one included under it; while all the rest of men not thus elected He decreed to pass by,—to leave in their natural state of sin and misery, and finally to punish eternally for their sin.” The Arminian doctrine of predestination (see ARMINIUS) is that God has from eternity decreed to give eternal life to as many as repent and believe, and foreseeing who shall repent and believe He has determined to give life to these. The “peremptory” election of individuals to life eternal proceeds only on the foreknowledge of their faith and obedience, so that, as the Remonstrants explicitly affirmed, the decree proper in predestination is that decree by which it is determined on what grounds or conditions God assigns sinners to salvation.² The difference between these two views of predestination is wide, and, when logically carried out, radical. The Calvinist

¹ This restricted use of the term is favoured by Lutherans (“*Accipitur predestinatio vel impropre, quomodo destinationem et ad vitam et ad mortem complectitur, . . . vel proprie, quomodo phrasi scripture tantum ordinationem ad vitam notat*,” Quenstedt). In a different interest, the Westminster Confession seems to incline to restrict the use of the word “predestinate” to the decree which secures to some men life eternal, while for the obverse of that decree, by which the rest of men are consigned to everlasting death, it prefers the term “foreordained”: its words are, “By the decree of God, for the manifestation of His glory, some men and angels are *predestinated* unto everlasting life and others *foreordained* to everlasting death. These angels and men, thus predestinated and foreordained,” &c. Dr Cunningham (*Historical Theol.*, ii. 422) tells us that this distinction is not grounded either on etymology or on the usage of theologians, “but Calvinists, in general, have held that there is an important difference between the way and manner in which the decree of election bears or operates upon the condition and fate of those who are saved, and that in which the decree of reprobation, as it is often called, bears or operates upon the condition of those who perish; and the *existence* of this difference, though without any exact specification of its nature, the compilers of the Confession seem to have intended to indicate, by restricting the word ‘predestinate’ to the elect, the saved; and using the word ‘foreordained’ in regard to the rest.” Probably a significance slightly more definite should, however, be attached to the introduction of this distinction; for as early as the age of Augustine objection was taken to the expression “*predestinati ad interitum*” on the specific ground that it seemed to impose upon men a necessity of perishing. And Bishop Davenant, while he does not shrink from using the term “predestinate to death,” gives this significant explanation: “if by predestinating *ad interitum* we understand the causing and effectual working of any man's destruction, God cannot be said *predestinare ad interitum*: but if we only understand the foreordaining of those to damnation whom God foresaw deserving and working the same, we neither think nor speak otherwise than the orthodox Fathers did” (*Animadversions*, &c., p. 41).

² “Sententia Remonstr.” in Hales's *Letters from Dort*, pp. 174-175; also *Apol. Conf. Remonstr.*, p. 102.

maintains that God absolutely decrees the salvation of a certain fixed number of definite persons, and in pursuance of this decree infallibly secures their salvation; the Arminian maintains that God's decree, so far as it concerns the salvation of individuals, is conditional upon their use of the means of grace. That which constitutes Arminianism is the denial that God absolutely elects individuals to eternal life; and that which lies at the root of Calvinism, and out of which all that is characteristic of the system springs, is the affirmation that God does absolutely elect certain individuals to life eternal, and in pursuance of this decree works in them all that constitutes life eternal. According to Calvinism, salvation is the work of God. Seeing men to be all alike helplessly involved in sin and misery, God determined to save some, not on account of any good in them but for some inscrutable but necessarily wise and just reasons, and because of this determination He gives to those whom He wills to save, and enables them to receive and retain, all that is involved in salvation,—renewal of will, union to Christ, holiness of life, the indwelling Spirit.

The doctrine of predestination was first formulated in the church by Augustine. The Pelagian idea that man is competent to determine his own character, conduct, and destiny was repugnant to him, and he strove to show that the initial and determining element in the salvation of the individual is not the human but the divine will. He based his position upon the doctrine of original sin and the consequent depravity of the will. This doctrine represents the whole human race as involved in moral ruin, guilty and sinful, incapable of self-regeneration or of willing what is good. By God alone, therefore, can regeneration and deliverance be accomplished. The salvation designed by God must not be allowed to depend for its efficacy on the depraved and incapable will of man; it must be an absolute act of power on God's part. Provision must be made not only for the offer but for the acceptance of grace. In a word, grace must be effectual or irresistible. Hence Augustine distinguished between "assistance without which a thing cannot be done" and "assistance by which a thing is done" (the Jansenist *adjutorium sine quo non*, and *adjutorium quo*, assisting and efficacious or irresistible grace). By every device of language he throws the whole work of salvation upon God ("facit credentes," "data sunt et ipsa merita quibus datur," "non solum mentes bonas adjuvat, verum etiam bonas eas facit"). This is the distinctive characteristic of the dispensation of redemption, that it depends not on man's will but on God's. "A dispensation which left the salvation of man dependent on his will was highly suitable as a first one, suitable alike to the justice of the Creator and the powers of the untried creature, and such as we should naturally expect at the beginning of things; but such having been the nature of the first, the second must, for that very reason, be a dispensation of a different kind, effecting its design not by a conditional but by an absolute saving act." This absolute saving act being an act of God, and it being maintained by all theologians that whatever God Himself does in time He has from eternity decreed to do, we have the doctrine of predestination. As Aquinas tersely puts the kernel of the Augustinian doctrine: "It is manifest that whatever is of grace is the effect of predestination." With Augustine grace is nothing else than predestination realized. Grace is irresistible because it is God's instrument in fulfilling His decree. This carries with it a refutation of the three modified forms of predestinarian doctrine which continually seek to make good for themselves a position within the church. It maintains (1) that men are elected not to means of grace only but to grace itself. Salvation is infallibly secured to the elect (*De Dono Persev.*, passim).

It maintains (2) that not nations or the church but individuals are the object of predestination,—a certain fixed number, "so certain that no one can be added to it or taken from it" (*De Corr. et Gratia*, 13). And (3) this predestination must be founded, not on foreseen good in man, but on the inscrutable but necessarily just will of God (*De Præd. Sanct.*, 17).¹

As Augustine thus constructed the doctrine of predestination as an integral part of the evangelical system, he necessarily spoke much more of election than of reprobation; but he did not shrink from acknowledging, with all intelligent predestinarians, that the election of some involved the passing by (*præteritio*) of the rest: "for the *rest*, where are they but in that mass of perdition where the Divine justice most justly leaves them?" (*De Dono Persev.*, 14). "If God from eternity absolutely elected some unto the infallible attainment of grace and glory, we cannot but grant that those who are not comprised within this absolute decree are as absolutely passed by as the others are chosen" (Bishop Davenant's *Animadversions*, p. 4). All men being naturally under condemnation, it seemed to Augustine no injustice that in some that condemnation should take effect; and, if it is suggested that it would at all events have been better had all been saved, he is content to reply, "Who art thou, O man, that repliest against God?" He has no hesitation, therefore, in using the expressions "*prædestinati ad interitum*," or "*ad æternam mortem*," or "*damnationi prædestinati*"; and in using these expressions he indicates that there are some to whom God has decreed not to give saving grace, and that He foresaw that these persons would sin and be damned. He does not bring the decree of reprobation into direct, and of course not into causal, connexion with the sins of the reprobate, holding that, while the decree of God is the efficient cause of all good in the elect, the cause of sin in the reprobate is the evil will of man. He denies that God's foreknowledge of man's sin makes that sin necessary, but he nowhere exhaustively discusses the distinction between foreknowledge and decree. When pushed to defend God's justice in creating those whose damnation He foreknew, he responds to the challenge sometimes by showing that, so far as the Creator's responsibility is concerned, the creature which sins with free will is of a higher kind than that which cannot sin because it has no free will; sometimes on the ground that it contributes to God's glory that His retributive justice should be manifested; and sometimes on the ground that in the destruction of sinners the elect will see what God's goodness has saved them from.

About the middle of the 9th century Gottschalk attempted to revive Augustinianism (see GOTTSCHALK). His teaching regarding predestination was precisely that of his master, and as such it was maintained by Remigius of Lyons in opposition to the blundering and intolerant Hincmar of Rheims. Hincmar admitted predestination to life and also the consequent abandonment of the rest of men to their sinful state, and yet he mercilessly persecuted Gottschalk for maintaining a predestination to punishment, and sought to establish a distinction between leaving men in a state which involves punishment and ordaining them to punishment. Remigius exposed the futility of such a distinction, and showed that "the abandonment of a certain portion of mankind to the state of sin in which they are born is predestinarian reprobation, whether we express it as abandonment to sin or as ordaining to punishment." The discussion, however, extensive and heated as it was, did not go deeply into the substance of the controversy. The incident which gave a distinctive character to this period of the development of the doctrine

¹ See Mozley, *Augustinian Doctrine of Predestination*.

was the appeal for aid which Hincmar made to John Scotus Erigena; for in the tract on predestination which Erigena wrote in response to this appeal he introduced the terms and methods of philosophy and sought a solution for the problem in the nature of God. He argued that, God being eternal, foreknowledge and predestination, which are temporal relations, could only improperly be predicated of Him. He argued also that sin and its consequences in death and misery are nonentities, the mere corruption, defect, or privation of their opposite realities, and that therefore they can neither be caused by God nor be known by Him. Reprobation is therefore impossible. Still further, he argued that evil is only a stage in the development of good, and that the ultimate issue of the development is universal return to God. This orthodoxy was considered more dangerous than the heresy it was called in to resist. Prudentius, Ratramnus, Lupus, and Florus denounced the introduction of this style of discussion, for which indeed the mind of the church was not at that time prepared. Not only did interested individuals resist the teaching of Erigena, but two councils condemned his treatise as containing "hæreses plurimas, ineptas quæstionculas, et aniles pæne fabellas, pluribus syllogismis conclusas, Scotorumque pultes puritati fidei nauseam inferentes." Accordingly no additional light on the problem was received by the church at this time.

This controversy, however, was merely the prelude to a discussion which was maintained throughout the scholastic period, and in which the Thomists adopted the more rigid Augustinian view, while the Scotists leaned to Semipelagianism. Anselm and Peter Lombard were moderately and guardedly Augustinian. Thomas Bradwardine (archbishop of Canterbury, d. 1349) complained that almost the whole world had fallen into Pelagianism, and strenuously opposed this tendency. But it is in Aquinas (*Summa*, I, Q. xxiii.) that we find the clearest and most compact treatment of the subject. His doctrine is substantially that of Augustine. In express terms he teaches that predestination is an essential part of the divine providence, and that, as some, and these a fixed number, are ordained to life eternal, so by the same divine providence others are allowed to fail of this end ("et hoc dicitur reprobare"). He teaches further that this predestination does not depend upon any foreseen difference of character ("præscientia meritorum non est causa vel ratio predestinationis"). Aquinas derives his doctrine of predestination directly from his doctrine of God (not from his anthropology, as Augustine had done). His idea of God was the Aristotelian "first mover, itself unmoved." That God is in all things by His power, presence, and essence he explicitly maintains against three forms of error regarding the connexion of God and the world. The divine will is the cause of all things past, present, and to come.

But the contribution made by Aquinas consists in his theory of the divine concurrence, by which he seeks to provide a philosophical basis for Augustinianism. The divine providence governs all things by means of two great classes of secondary causes, the necessary or natural and the contingent or voluntary. The mediate or proximate causes of all that takes place in the natural world are necessary; the proximate causes of human action are the voluntary motions of the will. But both are set in motion by God, the First Cause: as the actings of natural causes remain natural, though they are moved by God, so do the actings of voluntary causes remain voluntary though moved by God.¹ But obviously this theory leaves only an appearance of free will. "Free will is here reconciled

and made consistent with the divine power, brought into the same scheme and theory. But it is of itself a sufficient test that a system is necessitarian, that it maintains the divine power in *harmony* with free will. The will as an original spring of action is irreconcilable with the divine power—at least with the scholastic idea of the divine power—"a second first cause in nature being inconsistent with there being only one First Cause." Besides, every theory of predestination which bases itself on the idea that God is the sole originating and true cause must give an account of the origin of evil. Aquinas recognizes this and endeavours to meet the requirement by showing (1) that to a complete universe all kinds of creatures are requisite, not only the highest but the lowest; (2) that there cannot be a perfect universe without the existence of free will, but that this involves the risk of evil; and (3) that evil is a negation. Of these arguments there are hints in the writings of Augustine and Erigena, and none of them is satisfactory, although they certainly point in the right direction.

At the Reformation the discussion was drawn back from the endeavour initiated by the schoolmen to find for the doctrine of predestination a scientific basis in the nature of God and His connexion with the world. The more circumscribed method of Augustine was reverted to, and it was deemed sufficient to show that predestination was indispensable to the ideas of grace which found a response in the devout Christian consciousness, and that it was in harmony with Scripture. Not only Calvin, but much more unguardedly Luther, and even Melancthon in the earliest (1521) edition of his *Loci Communes*, taught the most rigid Augustinian doctrine. In the later editions (1535, 1543) Melancthon greatly modified his opinions and inclined more to the synergistic view, though even in this he was not thoroughgoing. But the attempt to terminate the synergistic controversy saddled the Lutherans with a symbol—the *formula concordie*—which, awkwardly enough, rejected both the Semipelagian theory of co-operation and the Augustinian doctrine of predestination. The consequence has been that later Lutheran theologians, in their efforts to purge their church of this inconsistency, have devised the theory that man, unable as he is to will any good thing, can yet use the means of grace, and that these means of grace, carrying in themselves a divine power, produce a saving effect on all who do not voluntarily oppose their influence. Baptism, e.g., confers grace which, if not resisted, is saving. And God, foreseeing who will and who will not resist the grace offered, predestinates to life all who are foreseen as believers.

The theory of Calvin (*Inst.*, i. 15-18; iii. 21-24) need not be detailed, because it is Augustinian not only in its substance but in the methods and grounds by which it is sustained.² Hagenbach (*Hist. of Doctrines*, iii. 103) and others have indeed asserted that Calvin held the supralapsarian theory, and in so far differed from Augustine. But in order to prove Calvin or any one else a supralapsarian it is not enough to show that he believed that the fall was decreed, for this is admitted by Augustine and all sublapsarians; it must be shown that the fall was decreed as a means towards carrying out a previous decree to save some and leave others to perish,—a view which Calvin turns from as an *otiosa curiositas*. The supralapsarian view was, however, adopted by Beza and other Calvinists, as it had been held by some of the Augustinian schoolmen; and indirectly this led to the reopening of the controversy in the beginning of the 17th century. For it is said to have been the extreme supralapsarianism of Perkins which repelled Arminius from Calvinism and

¹ "Sicut naturalibus causis, movendo eas, non aufert quin actus earum sint naturales, ita movendo causas voluntarias, non aufert quin actiones earum sint voluntarie, sed potius hoc in eis facit."

² Compare Burnet, *On the XXXIX. Articles*, and Mozley's *Augustin. Doct.*, where this agreement is affirmed.

led him to promulgate the opinions which are known as Arminianism, and which led to the summoning of the synod of Dort (see ARMINIUS and DORT). The canons of Dort, while not definitively exclusive of supralapsarianism, are favourable to the sublapsarian view; and the Westminster divines followed the lead of Dort in constructing their *Confession* so as to admit of signature by either party.

Meanwhile the Church of Rome had been torn by similar diversities of opinion. The council of Trent was careful not to offend the Dominicans by explicitly repudiating Augustinian doctrine. But, as time went on, the Jesuit MOLINA (*q.v.*) stirred the sleeping controversy by a well-meant and decidedly able attempt to reconcile free will and God's foreknowledge. A still more serious disturbance was created by the strenuous efforts of Jansen to revive the decaying Augustinianism of the church. But neither then nor in more recent times has anything essential been added to the argument on either side; and until our knowledge of the freedom of the will becomes more scientific—that is, more accurate, thorough, and reliable—it is impossible that the argument can advance. During the last two centuries the discussion in England has turned not so directly on the truth or falsity of Calvinism as upon the question whether the Church of England Articles are or are not Calvinistic. This question has been reopened at various times—at the dismissal of Baro from the Margaret professorship at Cambridge at the close of the 16th century; on occasion of Dr Samuel Clarke's plea for Arian subscription; in connexion with the Wesleyan claim that the Articles favoured Arminianism; and again, in this century, in the Bampton lectures of Archbishop Lawrence. The arguments which may be gathered from the actual terms of the seventeenth Article itself are very fairly stated by Bishop Burnet, who, though himself an Arminian, frankly allows that Calvinists can sign the Article with less scruple than Arminians, "since the Article does seem more plainly to favour them." The historical facts regarding the theological school to which the framers of the Articles belonged are very fully given in Goode's *Effects of Infant Baptism*.¹ In Germany, notwithstanding Herder's dismissal of the subject of predestination with the curse, "May the hand wither that shall ever bring it back," theologians still range themselves in opposite camps,—Kliefoth, Frank, and Sartorius advocating the Augustinian doctrine, while Thomasius, Hofmann, and Luthardt attempt a middle course.

Lipsius justly observes that the solution of the problem of predestination is the solution of the religious problem in general. The Augustinian theory is not an isolated doctrine which may be accepted or rejected without any material alteration of fundamental beliefs. It is rather a deliverance upon the relation which subsists between God and the world,—that is, upon the radical problem of philosophy. No doubt it is rather in a theological than in a philosophical interest that the subject has usually been debated. It has been felt that the Augustinian theory accords better with the devout humility of the religious spirit, and lays a sure ground for hopeful confidence; while the opposed theory is considered to be more likely to excite human effort and secure a more satisfactory level in conduct, if not a higher spiritual condition. Both parties have been influenced by a perhaps somewhat officious zeal for the divine reputation, the one party being concerned to maintain God's sovereignty, the other His goodness. Our ignorance of the divine nature, and our inability to apprehend the subtlety of His connexion with the world, have not been sufficiently allowed for by either party. Is God the absolute sovereign without whose will no individual act is done? Is He in all things by His essence and will? Then the Calvinistic scheme seems alone legitimate. As Calvin himself argues, if God has not absolutely decreed all things, then "ubi erit illa Dei omnipotentia, qua secundum arcanum consilium, quod aliunde non pendet, omnia moderatur?" (*Inst.*, iii. 23, 7). And yet, if God's sovereignty is thus universal, can the freedom of the human will be preserved in more than name? Is not the world

of human thought and action reduced to a mere play of puppets, a pantheistic sham? If God's will has determined all that is to be, what real power of origination is left to man? He who determines upon a certain event sets in operation such causes as will produce it, and is himself its proper efficient cause. If God is thus the real cause of all that is, the universe would seem to be merely God evolving Himself, and there has been no true creation, no bringing into being of wills separate from His own.

The grave difficulty, therefore, with which the strict doctrine of predestination has always to contend is its apparent inconsistency with human accountability. It is accused generally of colliding with human freedom, and particularly of representing God as the author of sin. This consequence of their teaching Calvinists repudiate. They maintain that by God's foreordination of whatsoever comes to pass "violence is not offered to the will of the creature"; and they have adopted various methods of relieving their doctrine from the odium of this charge. The character of an act has been separated from its substance or actuality, and, while its character is ascribed to man's free will, its actuality is referred to God's sustaining energy. Or it has been supposed that God may have created men with the power of originating action, so that, though dependent upon God for life, yet when kept in life men can act freely. But this scarcely meets the difficulty, for Calvinism maintains that each individual act is determined by God. Others again prefer to relegate these seeming contradictions to the region of the unknowable, and to say with Locke: "I cannot have a clearer perception of anything than that I am free, yet I cannot make freedom in man consistent with omnipotence and omniscience in God, though I am as fully persuaded of both as of any truth I most firmly assent to; and therefore I have long since given off the consideration of that question, resolving all into the short conclusion that if it be possible for God to make a free agent, then man is free, though I see not the way of it." (M. D.)

PRE-EMPTION. See SALE.

PRELATE. See ABBOT and BISHOP.

PRELLER, FRIEDRICH (1804-1878), German landscape-painter, was born at Eisenach on 25th April 1804. After studying drawing at Weimar, he went in 1821, on Goethe's advice, to Dresden, where he made such progress that in 1824 he was invited to accompany the grand-duke of Weimar to Belgium, where he became a pupil in the academy at Antwerp. From 1827 to 1831 he studied in Italy, and in the last-named year he received an appointment in the Weimar school of art. In 1834-36 he executed in tempera six pictures on subjects taken from the *Odyssey* in the "Roman House" at Leipsic, in 1836-37 the landscapes with scenes from *Oberon* in the Wieland room in the grand-ducal palace at Weimar, and in 1836-48 six frescos in Thuringian subjects commissioned by the grand-duchess. In 1840 he visited Norway and produced a number of easel works, some of which are preserved at Weimar. In 1859 he revisited Italy, and on his return in 1861 he completed for the grand-ducal museum the landscapes illustrative of the *Odyssey*, which are held to constitute his chief claim to fame, entitling him to rank with Poussin and Claude Lorraine in the hierarchy of painters. Preller, who was also a successful etcher, died at Weimar on 23d April 1878.

PRELLER, LUDWIG (1809-1861), author of well-known works on Greek and Roman mythology, was born at Hamburg on 15th September 1809. He studied philology at Leipsic under Gottfried Hermann, at Berlin under Böckh, and at Göttingen under O. Müller, graduating at the last-named university in 1832. After "habilitating" as privat-docent in Kiel, he was called in 1838 to an ordinary professorship at Dorpat, which, however, he speedily resigned along with several other German professors in consequence of misunderstandings with the Russian governing body. He afterwards spent some time in Italy, but settled in Jena in 1844, where he became professor in 1846. In the same year he removed to Weimar as head librarian and hofrath. In 1852 he travelled in Greece and Asia Minor. His death occurred at Weimar on 21st June 1861.

Preller's chief works are—*Demeter u. Persephone* (1837), *Griechische Mythologie* (1854-55; 3d ed., 1872-75), and *Römische Mythologie* (1858; 3d ed., 1878). He also co-operated with H. Ritter in the preparation of a useful *Historia philosophiæ græcæ et romaniæ*

¹ A review of the controversy and its literature will be found in Cunningham's *Reformers and Theology of the Reform.*, Essay iv.; and, on the other side, Hardwick's *Hist. of the Articles* may be consulted.

ex fontium locis contexta (1838; 4th ed., 1869), and contributed extensively to Ersch and Gruber's *Allgem. Encykl.*

PRENZLAU, or **PRENZLOW**, a town of Prussia, in the province of Brandenburg, lies on the lower Ucker See, 60 miles north by east of Berlin and 30 miles west by south of Stettin. It is a busy little place with various branches of industry, among the chief of which are wool cleaning and spinning, iron-founding, and sugar-refining. A good deal of tobacco is grown in the neighbourhood, and there is a cigar manufactory in the town. A brisk trade is carried on also in cattle and grain. The Gothic church of the Virgin, dating from 1340, is one of the finest churches in the district, and the remains of the old town gates and walls are also interesting. In 1880 Prenzlau contained 16,933 inhabitants, nearly all Protestants and many of French descent. The garrison consists of about 800 men.

Prenzlau is first mentioned in a document of the close of the 12th century, and received its municipal charter in 1235. As the capital of the old Ucker mark it was a frequent object of dispute between Pomerania and Brandenburg until finally incorporated with the latter about 1480. It was at Prenzlau that Prince Hohenlohe, with his corps of 12,000 men, surrendered to Murat on the retreat after the battle of Jena.

PRERAU (Slav. *Prerow*), one of the oldest towns in Moravia, lies on the Beczwa, 13 miles to the south-east of Olmütz. It is an important railway junction and carries on a considerable trade. The chief industries are sugar-boiling (from beetroot), rope-making, and the manufacture of agricultural and other machinery. The only buildings of interest are the old castle, once occupied by Matthias Corvinus, and the Gothic town-house. The population in 1880 was 10,985.

PREROGATIVE, in law, is an exclusive privilege of the crown. The word, originally an adjective, is derived from the *centuria prerogativa*, or century which voted first on a proposed law (*rogatio*) in the Roman *comitia centuriata*. In English law, Blackstone says, "by the word prerogative we are to understand the character and power which the sovereign hath over and above all other persons, in right of his regal dignity; and which, though part of the common law of the country, is out of its ordinary course. This is expressed in its very name, for it signifies, in its etymology, something that is required or demanded *before*, or in preference to, all others; and, accordingly, Finch lays it down as a maxim that the prerogative is that law in the case of the king which is law in no case of the subject" (Stephen's *Comm.*, vol. ii. bk. iv. pt. i. ch. vi.). The prerogative is sometimes called *jura regalia* or *regalia*, the *regalia* being either *majora*, the regal dignity and power, or *minora*, the revenue of the crown. The word "prerogative" is used to denote the whole privilege of the crown or any part of it; in the latter sense it may be used in the plural number.

The theory of English law as to the prerogative of the king seems to be not quite consistent. On the one hand, he is a perfect and irresponsible being, holding his office by divine right; "Victoria, by the grace of God of Great Britain and Ireland Queen,"¹ is still the heading of every writ. On the other hand, his powers are defined and limited by law. This is laid down as early as the 13th century: "Rex non debet esse sub homine sed sub Deo et sub lege, quia lex facit regem" (Bracton, 5b),—a striking contrast to the rule of Roman law, "quod principi placuit legis habet vigorem." A consequence of this position is that the prerogative may be confined or extended by the supreme legislative authority, and that the courts have jurisdiction to decide whether or not any alleged right falls within the prerogative. The prerogative of the crown, still of great extent, has been gradually limited by a long

¹ There is no difference in the prerogative as exercised by a king or a queen regnant, so that the word "king" in its constitutional sense includes queen. That the queen regnant has the same rights as a king was declared by 1 Mary sess. 3, c. 1.

series of enactments, the most worthy of notice being *Magna Carta*, *Confirmatio Cartarum*, *Prerogativa Regis*, the Petition of Right, the Habeas Corpus Act, the Bill of Rights, and the Act of Settlement. (See ENGLAND.) Where a prerogative was abolished by statute, in some instances compensation was granted in return for the surrender, in others no compensation was given. An example of the former is the statute 12 Car. II. c. 24, by which excise duties were granted to the crown in return for the abolition of military tenures and their incidents; of the latter, the statute 16 Car. I. c. 20, abolishing the prerogative of imposing compulsory knighthood or a fine in its place. The prerogative has also been limited by judicial decision and by tacit abandonment. Thus monopolies were declared illegal (in the respectful language of the judges the queen was held to have been deceived in her grant) in the reign of Elizabeth by *The Case of Monopolies* (11 Coke's Reports, 84), and the right to exclude a member from parliament was abandoned by the same queen in 1571. The most important of the obsolete prerogatives, other than those named, which have been at one time claimed and exercised are the following. (1) The right to impose a tax upon the subject without the consent of parliament was the subject of contest for centuries. Sums were raised at various times under the names of tallage, scutage, hydrag, subsidies, aids, benevolences, tonnage and poundage, tolls, ship-money, tenths, fifteenths, &c. (2) The right to dispense with the obligation of statutes, by the insertion in a grant of the clause *non obstante statuto*, was frequently asserted by the crown down to the Revolution. An end was finally put to this and the last right by the Bill of Rights. (3) The right of purveyance and pre-emption—that is, of buying up provisions at a valuation without the consent of the owner—and the right of impressing carriages and horses were finally abolished by 12 Car. II. c. 24. (4) The authority to erect tribunals not proceeding according to the ordinary course of justice was declared illegal by 16 Car. I. c. 10 (the Act dissolving the Star Chamber, the court of the marches of Wales, and the court of the president and council of the north). (5) The revenue from first-fruits and tenths, annexed to the crown by Henry VIII., was vested by Queen Anne in trustees for the augmentation of poor benefices, 2 and 3 Anne c. 11. This is what is usually called "Queen Anne's bounty." (6) The right of corody—that is, of sending one of the royal chaplains to be maintained by a bishop until the bishop promotes him to a benefice—has become obsolete by disuse. (7) The right by forfeiture to the property of a convict upon his conviction for treason or felony was abolished by the Felony Act, 1870. (8) The immunity of the crown from payment of costs has been taken away in almost all cases. The crown is liable to costs in revenue cases by 18 and 19 Vict. c. 90, in petitions of right by 23 and 24 Vict. c. 34. (9) The right to alienate crown lands by grant at pleasure was taken away by 1 Anne c. 8, passed in consequence of the improvident alienations of land by William III. In very few cases has the prerogative been extended by statute; 34 and 35 Vict. c. 86 is an example of such extension. By that Act the jurisdiction of lords-lieutenant of counties over the auxiliary forces was re-vested in the crown.

The prerogative may be exercised in person or by delegation. The prerogative of conferring honours is generally (though not necessarily) exercised by the king in person, as in the case of investment with knighthood and military or civil decorations. The delegation of the prerogative often takes place by commission, issued with or without a joint address from both Houses of parliament. An example of a commission issued on a joint address is the commission to inquire into the existence of corrupt practices after an election (15 and 16 Vict. c. 57). In most

cases a commission is issued by the prerogative alone without any address from parliament; thus the assent of the crown to a Bill may be given by commission, and rights of command may be granted by commission to officers in the army and navy. The delegation of the prerogative in judicial matters is illustrated by commissions of the peace and commissions of assize. The prerogative may still further be delegated by a delegate; thus commissions of lunacy are and commissions of bankruptcy were issued by the lord chancellor as the representative of the crown. Parts of the prerogative—generally in the nature of profit, and so in derogation of the revenue of the crown—may be conferred upon subjects by grant in letters patent, which will be presumed after enjoyment by the subject for a certain time. What in the king is a prerogative becomes a franchise in the subject, *e.g.*, chases, warrens, wrecks, treasure-trove, courts-leet.

The existing prerogatives may be divided, with Blackstone, into such as are direct and such as are by way of exception; or perhaps better, with Chief Baron Comyns, into those affecting external relations and those affecting internal relations. Under the first class would fall the power of making war and concluding peace. As incidents to this power the king has the right of sending and receiving ambassadors, of concluding treaties, and of granting passports, safe-conducts, letters of marque, and reprisals. These rights may be limited by international agreement; thus the Declaration of Paris, 1856, abolished privateering as far as the assenting nations (of whom Great Britain was one) were concerned.

The prerogatives affecting internal relations may be conveniently, if not scientifically, classified as personal, political, judicial, ecclesiastical, and fiscal.

Personal.—In order that there may always be an existing head of the state the king is regarded as a corporation. He cannot die; there can be only a demise of the crown,—that is, a transfer of the royal authority to a different person. On the same principle the king cannot be under age, though in cases where the king has been of tender years a protector or regent has usually been appointed for administrative purposes. The king is personally irresponsible for crime or tort, it being an ancient common law maxim that the king can do no wrong, and that any injury suffered by a subject at the hands of the king is to be attributed to the mistake of his advisers. A curious consequence of this irresponsibility is that the king is apparently the only person in the realm who cannot under any circumstances arrest a suspected felon, for no action for false imprisonment would lie against him, and in the event of the arrest of an innocent person there would be a wrong without a remedy. He cannot be guilty of laches or negligence. The maxim of the common law is “Nullum tempus occurrit regi.” This is still the law in criminal matters. With a very few exceptions, such as prosecutions for treason and offences against the customs, no lapse of time will in England (though it is otherwise in Scotland) bar the right of the crown to prosecute. In civil matters the crown is barred of its right in suits relating to land by the lapse of sixty years (9 Geo. III. c. 16). The king is exempt from taxation on the ground that, as the revenue of the realm is his prerogative, it is useless for him to tax himself. But lands purchased by the privy purse are liable to taxation (39 and 40 Geo. III. c. 88, s. 6). He is also exempt from tolls (which can only exist as a franchise granted by him), and from the poor-rate, as he is not mentioned in the Poor Law Acts. His person cannot be arrested, or his goods distrained or taken in execution. The privilege of exemption from taxation applies to his palaces and to the public buildings of the state. No kind of judicial process can be executed in a palace as long as it continues to be a royal residence. The privilege does not attach to palaces which the king has ceased to use as a dwelling, such as Hampton Court, with the one exception of Holyrood House, with the precincts, which still affords a sanctuary from civil process. It does not, however, protect criminals or crown debtors. The king has also several personal privileges of minor importance, such as the title of “majesty,” the right to a royal salute, to the use of the royal standard and of special liveries, &c.

Political.—The king is the supreme executive and co-ordinate legislative authority. As such authority he has the attribute of sovereignty¹ or pre-eminence, and the right to the allegiance of his subjects. All land is mediately or immediately held of him (see LAND). Land derelict suddenly by the sea, land newly discovered by subjects, and islands arising in the sea are his. As paramount authority in parliament he can dissolve or prorogue it at pleasure, but cannot prolong it beyond seven years. In theory parliament

only exists at his will, for it is summoned by his writ, and the vote for a member of parliament is only a franchise, not a right existing independently of his grant. He can refuse his assent to a Bill passed by the Houses of parliament. This right has, however, not been exercised since 1707, when Queen Anne refused the royal assent to a Scottish Militia Bill. The king has power to issue proclamations and (with the assent of the privy council) orders in council, in some cases as part of the ancient prerogative, in others under the provisions of an Act of parliament. Proclamations are only binding so far as they are founded upon and enforce the laws of the realm. They cannot alter the common law or create a new offence. By 31 Hen. VIII. c. 8 it was enacted that the king's proclamations should, under certain conditions, have the force of Acts of parliament, but this Act was repealed by 1 Edw. VI. c. 12. The king is not in general bound by an Act of parliament unless named therein. He can, by virtue of his supreme executive authority, recall a subject from abroad, or forbid his leaving the realm by the writ of *ne eceat regno*. This writ at the present day is not used for state purposes, but merely to prevent a party to an action from going abroad. To order aliens to leave the realm is apparently a matter not falling within the prerogative, as, where such a course is necessary, an Act of parliament is passed; 11 and 12 Vict. c. 20 is an instance of such an Act passed for a temporary purpose. The right of the crown to grant letters of denization to aliens is preserved by 33 and 34 Vict. c. 14, s. 13. The king is the fountain of honour; as such he has the valuable power of granting peerages at will, so far as he is not restrained by any Act of parliament, and so far as he keeps within certain constitutional limits, *e.g.*, he cannot insert a shifting clause in a patent of peerage. He also confers all other titles of honour, whether hereditary or not, and grants precedence and armorial bearings. The great officers of state are appointed by the king. The only restriction upon the creation of offices is that he cannot create new offices with new fees attached to them, or annex new fees to old offices, for this would be to impose a tax upon the subject without an Act of parliament. The king, as head of the state, is in supreme command of the army and navy for the defence of the realm. This right, contested by the Long Parliament, was finally declared by 13 Car. II. c. 6 to be in the king alone. All supplies for the maintenance of the army and navy are voted annually, so that it is practically impossible for the king to use his position to the detriment of the state. The army is an annual institution, the Army Act of each session (which corresponds to the Mutiny Act passed annually up to 1878) reciting the provision of the Bill of Rights, “that the raising or keeping a standing army within the kingdom in time of peace, unless it be with consent of parliament, is against law.” The right of command carries with it as an incident the right to build forts and defences, to impress seamen in case of necessity, and to prohibit the importation of munitions of war (39 and 40 Vict. c. 36, s. 43), also the right to the soil of the foreshore and of estuaries of rivers, and the jurisdiction over territorial waters. (See NAVIGATION LAWS.) Other rights which fall under the political branch of the prerogative may be called the commercial rights, including the coining of money, the regulating of weights and measures, the establishing of markets and fairs, and the erecting of beacons, lighthouses, and sea-marks. The king also has the power of constituting corporations. A royal grant to inhabitants makes them a corporation for the purposes of the grant. The king is presumed to be the visitor of all civil corporations. As *parens patriæ* he is *ex officio* guardian of infants, idiots, and lunatics. It is scarcely necessary to point out that all these prerogatives (except the conferring of honours and such prerogatives as are purely personal) are exercised through responsible ministers, practically in these days members of the party to which the majority of the House of Commons belongs. Thus the jurisdiction over infants, &c., is exercised in England by the lord chancellor, and over beacons, &c., by the Trinity House, under the general superintendence of the Board of Trade.

Judicial.—The king is the fountain of justice, and the supreme conservator of the peace of the realm. “By the fountain of justice,” as has been well said by Blackstone, “the law does not mean the author or original, but only the distributor. Justice is not derived from the sovereign, as from his free gift; but he is the steward of the public, to dispense it to whom it is due. He is not the spring, but the reservoir, from whence right and equity are conducted, by a thousand channels, to every individual” (Stephen's *Comm.*, vol. ii. bk. iv. pt. i. ch. vi.). The king was bound to the observance of justice by the well-known words of *Magna Carta*, “Nulli vendemus, nulli negabimus aut differemus, rectum aut justiciam.” As supreme judge the king has the appointment of all judicial officers (other than those in certain local courts), who act as his deputies. He may constitute legal courts for the administration of the general law of the land, but he cannot erect tribunals not proceeding according to the known and established law of the realm, such as the Star Chamber (see above) or the commissions of martial law forbidden by the Petition of Right. Nor can he add to the jurisdiction of courts; thus he cannot give a spiritual court temporal

¹ The word “sovereign” is frequently applied to the king in legal works. It should be borne in mind at the same time that the king is not a sovereign in the strict sense in which the term is used by Austin.

powers. In early times the kings sat in person in the *curia regis*. The growth of a permanent judicature seems to be due to the increase of judicial business, making it impossible for the king to hear all the suits in the *curia regis* in person. Appeals from the colonies, the Channel Islands, and the Isle of Man still lie to the crown in council, a jurisdiction now practically exercised by the judicial committee of the privy council. The king is still (or was until very recently) in theory present in court. Actions in the Queen's Bench were until modern times said to be *coram rege ipso*, and the king could not be non-suited, for a non-suit implied the non-appearance of the plaintiff in court. The king enforces judgment by means of the sheriff, who represents the executive authority. As supreme conservator of the peace, the king, through the lord-lieutenant in counties and through the lord chancellor in cities and boroughs, appoints justices of the peace. In the same capacity he is the prosecutor of crimes. All indictments still conclude with the words "against the peace of our lady the Queen, her crown and dignity." As it is the king's peace that is broken by the commission of a crime, the king has, as the offended party, the power of remission. The king cannot be sued by ordinary action. He may sue by ordinary action, but he has the advantage of being able to use prerogative process (see below). He has the right of intervention in all litigation where his rights are concerned, or in the interests of public justice, as where collusion is alleged between the decree nisi and the decree absolute in divorce. Crown debts have priority in administration and bankruptcy.

Ecclesiastical.—The king is recognized as head of the church by 26 Hen. VIII. c. 1 and 1 Eliz. c. 1. By this prerogative he convenes and dissolves convocation and nominates to vacant bishoprics and other ecclesiastical preferments. He is also guardian of the temporalities during the vacancy of a see, but this is now merely a nominal prerogative. The dean and chapter of a cathedral cannot proceed to the election of a bishop without the king's permission to elect (*congé d'élire*). When any benefice is vacant by the promotion of the incumbent to a bishopric other than a colonial bishopric the king has the patronage *pro hac vice*. He is the supreme court of appeal in ecclesiastical cases. This appellate jurisdiction is now vested in the judicial committee of the privy council, with the assistance of archbishops and bishops as assessors (39 and 40 Vict. c. 59, s. 14). The king cannot create new ecclesiastical jurisdiction in England or in colonies other than crown colonies. (See BISHOP.) Where a new bishopric is created it is under the powers of an Act of parliament. It seems to be as head of the church that the king grants licences to hold in mortmain, though the right now extends to lay as well as ecclesiastical corporations. The right is acknowledged by 7 and 8 Will. III. c. 37.

Fiscal.—The theory of the constitution is that the king, being entrusted with the defence of the realm and the administration of justice, must have sufficient means given him for the purpose. The bulk of the revenue of the Norman and Plantagenet kings was derived from crown lands and feudal dues. At the present day the rents of crown lands form a very small part of the revenue, and the feudal dues do not exist except in the pecuniarily unimportant cases of escheat, royal fish, wrecks, treasure-trove, waifs and strays, &c. Of the revenue a comparatively small part (the civil list) is paid to the king in person, the rest (the consolidated fund) is applied to public purposes.

Prerogative Process.—This is the name given to certain methods of procedure which the crown alone has the right of using; such are inquest of office (an inquiry by jury concerning the right of the crown to land or goods), extent (a mode of execution), *scire facias* (for the resumption of a grant), and information (by which proceedings are commenced in the name of the attorney-general for a public wrong or for injury to crown property).

Prerogative Writs.—Certain writs are called "prerogative writs," as distinguished from writs of right, because it is within the prerogative to issue or reissue them. In order to induce the court to issue them a *prima facie* case must be made out by the applicant. Writs of right, on the other hand, are *ex debito iustitiæ*, and cannot be refused. Examples of prerogative writs are *certiorari*, *habeas corpus*, *mandamus*, *procedendo*, *prohibition*, *quo warranto*.

Prerogative Courts.—This was the name given to the provincial courts of Canterbury and York, as far as regarded their jurisdiction over the estates of deceased persons. They had jurisdiction to grant probate or administration where the diocesan courts could not entertain the case owing to the deceased having died possessed of goods above the value of £5 (*bona notabilia*) in each of two or more dioceses. The jurisdiction of the prerogative courts was transferred to the Court of Probate in 1857 by 20 and 21 Vict. c. 77, and is now vested in the Probate, Divorce, and Admiralty Division of the High Court of Justice by the Judicature Act, 1873 (36 and 37 Vict. c. 66, s. 34).

In the State of New Jersey, United States, the court having jurisdiction over probate matters is called the Prerogative Court (*Kent's Comm.*, vol. ii. p. 427).

Besides the authorities cited and the writers on constitutional history, the reader is referred to Allen, *Inquiry into the Rise and Growth of the Royal Pre-*

rogative in England; Chitty, *The Prerogative of the Crown*; Staunforde, *Exposition of the King's Prerogative*; Comyns, *Digest*, art. "Prerogative"; Broom, *Constitutional Law*. (J. Wt.)

PRESBYTER. Towards the end of the 2d century the organization of the Christian congregations throughout the Roman empire, at least of all the greater ones, was identical. At the head of each was the bishop, whose function it was to conduct public worship, control the church funds, and keep watch over the manners of his flock. The free prophets and teachers having almost everywhere died out, the duty of religious instruction and edification also fell on him. In conducting the worship and in ministering to the wants of the poor he was assisted by the deacons as his subordinates. The presbyters formed a college, whose business was that of advising the bishop. Of this college he was the president, and as such he was himself a presbyter, and conversely the presbytery, inclusive of the bishop, formed the governing body of the community.¹ Outside of the presbytery the individual presbyter as such had no definite official duties. If he baptized, celebrated the eucharist, preached, or the like, this was only as commissioned and deputed by the bishop.² Such deputation was frequently necessary, and therefore the presbyter behaved as far as possible to be qualified to teach. As member of the college, which before everything had to do with jurisdiction and discipline, it was required of him that he should be of blameless life, that he should administer just judgment without respect of persons, and that in private life also he should as occasion offered exhort and admonish the faithful and set before them the law of God. The presbyters, who as a rule were expected to be men of advanced years, were, like the bishop and the deacons, chosen by the congregation. Their number was unrestricted, but there were small communities in which they did not exceed three or even two. In rank they were above the deacons, but below the bishop, yet in such a way that the bishop could call them his "co-presbyters."³ As the bishop was not unfrequently chosen from among the deacons, even although in many congregations it may have been the case that the office was invariably bestowed on presbyters, and as the deacons stood in closer personal relation with the bishop than the presbyters, cases of invasion of the rights of the latter by the former began to occur from an early period. There can be no doubt that at the end of the 2d century all presbyters were elected office-bearers, but the way in which Irenæus speaks makes it quite clear that at an earlier date "presbyter" was also a title of honour borne by worthy and prominent persons in the congregations, who, in virtue of their advanced years, were witnesses for the purity of tradition. Irenæus, frequently speaking (as he does) of bishops simply as "presbyters," also proves that there must have been a time in which the bishop as member of the "synedrium" of the church cannot have held a higher position than the other members of this college.

Tracing the history upwards from Irenæus, we find in the *Epistles* of Ignatius, which may be assigned perhaps to about 140, the presbyters holding essentially the same

¹ Tertull., *Apol.*, 39: "Præsident probati quique seniores, honorem istum non pretio sed testimonio adepti."

² Tertull., *De Bapt.*, 17: "Baptismi dandi habet jus summus sacerdos, qui est episcopus; dehinc presbyteri . . . non tamen sine episcopi auctoritate." In the oldest constitution of the Catholic Church which has come down to us relating to presbyters a regular service of some presbyters in public worship is indeed presupposed (*Κανόνες ἐκκλησιαστ. τ. ἀγ. ἀποστόλων*, c. 18), but this fact is unique of its kind.

³ Compare the regulations laid down in the Arabic text of the *Canones Hippolyti* (c. 4): "At the ordination of a presbyter everything is to be done as in the case of a bishop, save that he does not seat himself upon the throne. The same prayer also shall be said as for a bishop, the name of bishop only being left out. The presbyter shall in all things be equal with the bishop save in the matters of presiding and ordaining, for the power to ordain is not given him."

position as they have at the end of the century. With Ignatius also the presbyters come into account only as a college; according to him they constitute a senate, as it were; he compares them to the college of the apostles, but gives great prominence to their subordination under the bishop, whom he likens to our Lord Himself. Except in the Ignatian *Epistles*, however, one finds the presbyters holding a different position within the Christian communities of the period from 90 to 140. This is not at all surprising, for there was not at that time any rigid and uniform organization of the congregations at all; as yet no one bishop stood at the head of each congregation, and as yet the church constitution was not determined by the idea of *office* alone, that of *charismata* (spiritual gifts) still having wide scope alongside of the other. Church organization was still influenced by a variety of ways of looking at the question—ways which sometimes crossed each other, and from the combination of which it cannot be doubted that a variety of constitutions resulted. We are not in a position to give a complete view of these, the historical material being insufficient, but points of leading importance can be established. Before all it is of consequence to recognize that in the congregations a threefold organization had place. (1) The duty of edifying and of preaching the gospel was not yet attached to an office but to a charisma. "Service in the word" was the business of apostles, prophets, and teachers who had been awakened by the Spirit and by the Spirit endowed. These were the *ἡγούμενοι* in the congregations; they alone in the first instance form the class of persons entitled to honour in Christendom; they never belonged to any one congregation exclusively, but were held to be "organs of the Spirit," given by God to the whole church. (2) In so far as each local church embraced a system of higher and lower functions—each was indeed a little world to itself—it possessed a governing body (*οἰκονόμοι*). For the care of the poor, for worship, for correspondence,—in a word, for its "economy," in the widest sense of that word, the congregation needed controlling officials. These were the bishop and the deacons,—the former for higher, the latter for inferior services; they owed their official position to the congregation, and in the nature of their offices there was, strictly speaking, nothing which could have laid the foundation of any special rank or exaltation. Many of the functions discharged by them nevertheless had the result of making the post of a bishop a very influential one (charge of the worship, control of the funds), and in so far as their service rested upon a charisma (*χάρισμα τῆς ἀντιλήμψεως*) a certain inner relation between them and the teachers endowed with the gift of the Spirit was established. (3) In so far as the individual congregation was an actual organism in which the varieties of age, of sex, of experience, of manner of life, and of ethical culture continued to exist and which had to be admonished, disciplined, and heeded, it from the nature of the case divided itself into leaders and led, a distinction which would assert itself in every sphere of the congregation's activities. The leaders were, as might be expected, the "elders" (*οἱ πρεσβύτεροι*), or, so to speak, the patrons; the led were the "younger" members (*οἱ νεώτεροι*). Out of this distinction arose equally naturally—for it was impossible for all the "elders" to take part in the conduct of affairs—the separation of an elected ruling college (*οἱ πρεσβύτεροι οἱ προΐσταμένοι*) from the *πλήθος* (*plebs, λαός*). Thus an "order" (*ordo*) arose, placed over the congregation by the congregation itself.¹ To the presbyters belonged a *τιμὴ καθήκουσα*,—that is to say, the honour which naturally came from their

position in life. In some congregations it may have been long before the elders were *chosen*, in others this may have come very soon; in some the sphere of the competency of the presbyters and patrons may have been quite indefinite and in others more precise. In some congregations, lastly, as in those of Asia Minor, the presbyters may have enjoyed particular honour for the special reason that they had known apostles or disciples of apostles personally;² in the majority of congregations this was not the case. With the congregational administration, properly so called, in any case, they had nothing to do.

We may call the first-named organization the *spiritual*, the second the *administrative*, the third the *patriarchal*. It is obvious that from the first it was impossible they should coexist side by side without coming into contact. Here two facts are of the highest importance. (1) If in any congregation prophets and teachers were wanting, then the administrative officials charged themselves with their function.³ (2) The bishops had as such a seat and a voice in the presbyters' college; every bishop was at the same time a presbyter, whether old or young, but every presbyter was not necessarily also a bishop. In many communities, indeed—as, for example, at Philippi,⁴ at Ephesus,⁵ and in Crete⁶—all the presbyters may possibly also have been bishops, although this is by no means certain; but in other cases—as, for example, in that of Rome, as we learn from the *Pastor of Hermas*—all presbyters were not also bishops. Thus it is not the case that originally the bishops were simply identical with the presbyters, and that the one bishop was a gradual development out of the presbyters' college; on the contrary, the attributes of presbyters and bishops were originally distinct. But, since the bishops had a seat and a voice in the college and exercised special functions of importance besides, they ultimately acquired a higher place.

The office of presbyter was not during the oldest period (90-140) a *spiritual* one. The apostle, the prophet, the teacher, in a certain sense also even the old bishop and deacon, had a spiritual character, for they possessed a charisma. It was not so with the presbyters; they had no charisma, and the respect in which they were held arose out of the *natural* position which they took within the congregations. Hence the newly-discovered *Διδαχὴ τῶν ἀποστόλων* has nothing to say at all about presbyters, but only about apostles, prophets, teachers, bishops, and deacons. The design of that writing was to give those institutions of the apostles which are peculiar to the Christian community. The system of leaders and led is, however, a matter of order; it does not depend upon the special Christian charismata, and therefore does not impart to the Christian community its peculiar character. But, on the other hand, that the community is God's building is shown by such marks as these, that the apostles spread the gospel by their inspired preaching, that prophets and teachers edify the churches, that everywhere bishops and deacons are found at work in the churches, endowed with the gift of government and of loving service. Other communities also—towns, temples, synagogues, and the like—have presbyters, but they have no persons endowed with the gift of the Spirit. A sure proof of the correctness of the view just given is found in the circumstance that before the time of Domitian we do not

² Compare what is said by Papias, Irenæus, and also by Clement of Alexandria.

³ See *Διδαχὴ τῶν ἀποστόλων*, 15. According to 1 Tim. v. 17 those presbyters are to be counted worthy of special honour *οἱ κοπιῶντες ἐν λόγῳ καὶ διδασκαλίᾳ*. But this makes it plain that the presbyters were under no obligation to teach.

⁴ Polyc., *Ad Philipp.*, 5, 6, 11.

⁵ 1 Tim. and Acts xx. 17, 28.

⁶ Ep. to Titus.

¹ Tertull., *De exhort. cast.*, 7: "Differentiam inter ordinem et plebem constituit ecclesiæ auctoritas et honor per ordinis consensum sanctificatus."

possess in Christian literature a single sure testimony to the existence of presbyters. In the genuine epistles of St Paul and in the Epistle to the Hebrews they are not mentioned. In 1 Cor. xii. 28 Paul says that God has given to the church apostles, prophets, teachers, miracles, gifts of healing, help, government; but of presbyters he has not a word to say. Even from passages where he is speaking of the jurisdiction of the congregation—as, for example, in 1 Cor. v., vi.—the presbyters are absent, while in Phil. i. 1 it is the bishops and deacons that he mentions. In the Epistle of James, in the First Epistle of Peter, in the Acts of the Apostles, and in the pastoral epistles the presbyters certainly occur, but no one is able to show that any of these writings are earlier than the age of Domitian. Even Clement of Rome (*Ad Cor.*, 42, 4) does not say that the apostles had appointed presbyters in the congregation; he speaks only of bishops and deacons. For this very reason is the statement in Acts xiv. 23 to be looked upon with suspicion. It would be much too precipitate to assert that before the time of Domitian there were no presbyters in the Christian churches; on the contrary, it may be assumed that the distinction between

“elder” and “younger” would not fail from the very first to assert itself in these communities, organized as they were so largely on the model of the family. But in this there is no reason for assigning any special importance to the distinction. Out of it there grew very gradually a special rank and gradually the presbyters had assigned to them definite functions; or, in other words, the functions which they had exercised from the first, of exhorting, rebuking, superintending, became recognized ecclesiastical duties and privileges. There is accordingly no need for answering the question whether the Christian “elder” is akin to the Jewish or to any kind of heathen “elder.” This, however, can well be affirmed, that the pattern of the civic senates was not without its influence upon the later development of the presbyterate. As for the communities of Jewish Christians, we know nothing certain about their constitution, and are therefore unable to say anything definite about their presbyters.

Reformation theories.

THE Presbyterian form of church government began at the Reformation and attained development only in the churches commonly called “Reformed.” The Saxon Reformers were not indeed fundamentally averse to Presbyterian principles. Melancthon, for instance, expressly declared that no minister, without a college of elders and the consent of worthy members of the congregation, might excommunicate; and, in a letter to Nuremberg (1540), Bugenhagen, Jonas, Luther, and Melancthon say, “*Restituatur et excommunicatio . . . adhibitis in hoc iudicium senioribus in qualibet ecclesia.*” On the other hand, the “Reformed” churches did not all accept the system, *e.g.*, Zwingli and the Zurich congregation.

In 1526 John Brenz drew up at Halle (Swabia) a scheme including elders, ministers chosen from the elders, and councils, by which the elders were chosen by the Government, who also had the final decision in all questions of importance. Franz Lambert, at the same time, provided for the church at Hesse provincial synods, representative of the churches, and a general or land synod, under the control of the Government. Within the limits of a congregation the scheme was purely congregational. At Ziegenhain in 1539 a decided advance was made towards autonomy, as only half the elders, who had extended powers, were there chosen by the Government. Zwingli theoretically gave the power to the congregation, practically to the civil power, as being the representative of the church. In Basel in 1529 the clergy alone had the power of church discipline. In 1530, however, Ecolampadius, fearing a spiritual tyranny, wished to join a body of elders with the clergy, to be chosen by the council partly from its own body and partly from the congregation, four from each, who with the clergy would form the “*censurum consensus.*” But the council, fearing the *imperium in imperio*, preferred four colleges, one for each parish, each college being formed by two members of the council, one of the congregation, and the minister; and the council also retained the final decision regarding excommunication. At Strasburg (1531) the council created an assembly of the ministers of the seven churches, with three life elders from each, nominated by the council. In 1534 this system was modified; ordinary matters were settled each fortnight by the minister and three of the twenty-one elders. Difficult questions were carried to the twenty-one, and

discipline, short of excommunication, to them with the seven ministers. Capito's system at Frankfort differed from this in that only three out of nine elders were elected by the council, and that the office was for three years only.

These all remained mere theories, limited, fragmentary, Calvin's and abortive. Calvin set himself to create a majestic system and comprehensive system and to give to it the double authority of argumentative statement and practical realization. He saw that the impulses and the aspirations of the Reformation were, for want of discipline, robbed of a large part of their dynamic force. He threw these forces and aspirations into the mould of his own genius, developed order out of tumult, and created a definite, yet elastic code, which should match the discipline of Rome and at the same time frustrate the anarchical tendencies of extreme Protestantism. The contrast with Luther is complete: Luther created, Calvin fashioned; “the watchword of the one was war, of the other order.” Calvin, surrounded by Catholic powers, felt more strongly than Luther that a definite protest as to church government was necessary. His leading principles are that—(1) a separate ministry is an ordinance of God (*Inst.*, iv. 3, 1-3); (2) ministers duly called and ordained may alone preach and administer sacraments (iv. 3, 10); (3) a legitimate ministry is one where suitable persons are appointed with the consent and approbation of the people, but that other pastors should preside over the election to guard against inconstancy, intrigue, or confusion (iv. 3, 15), the final act of ordination, the laying on of hands, being confined to the pastors; (4) to co-operate with the pastors there should be “governors,” whom he “apprehends” to be persons of advanced years, selected from the people to join with the pastors in admonishing and in exercising discipline (iv. 3, 8); (5) discipline, the ordering of men's lives, is all-important and is the special business of the governors aforesaid. Calvin arrived at these principles as follows. From Eph. iv. 11 *sq.*, Rom. xii. 7, and 1 Cor. xii. 28 he deduced five orders, of which three—apostles, prophets, and evangelists—were extraordinary and had lapsed, but two—pastors and doctors—were for all time. Doctors are concerned only with interpretation and exposition, pastors with preaching, sacraments, discipline. From the pastors some are singled out (1 Tim. v. 17), called, and ordained to “labour in the word,” to occupy themselves, in *fixed* charges, with preaching and administering

sacraments; while the rest are invested with jurisdiction in the correction of manners and with the care of the poor. For, although Christ gave to the whole congregation the power of excommunication, as in the Jewish Sanhedrim, and although, therefore, the elders are to use their power only with the consent of the congregation, yet the crowd are not to rule, lest arbitrariness and confusion enter. Deacons (or elders who have the care of the poor) are of two kinds, those who administer alms and those who attend to the sick. For additional sanction to his views Calvin often refers to the primitive church and the writings of the fathers. But with respect to this his position is best indicated by his own words in the preface to the *Institutes*: "We so read their writings as always to keep in view the saying of Paul (1 Cor. iii. 21-23) that all things are ours, to serve us that is, and not to rule over us, while we ourselves belong to the Lord, whom, without exception, we must all obey." (1) His system, while preserving the democratic theory in so far as it recognized the congregation as the holder of church power, was in practice strictly aristocratic, inasmuch as the congregation is never allowed any direct use of that power, which is invested in the whole body of elders; and the system constantly tended to development in the aristocratic direction. (2) The great object is discipline of life: "We come now to the third branch of the power of the church, and that which is the principal one in a well-regulated state, which, we have said, consists in jurisdiction. The whole jurisdiction of the state relates to the discipline of manners" (iv. 11, 1). In his correspondence too Calvin is ever on this subject, while the eldership itself is seldom mentioned; at Strasbourg his mind was constantly occupied with it; it was the first business that he set his hand to in Geneva; it was for insisting upon this that he was banished; and he made it his first condition for return (iv. 12). (3) Although the Presbyterian form of church government has to thank Calvin for its vertebrate existence, he nowhere makes the true church depend upon this or any other form of government. The inner life is what he insists upon, not the outward form; all that is needed for a true church, he asserts, is the word of God duly preached and the pure administration of the sacraments. He held the *jus divinum* of the ministerial office as admitting of no question—"that mode of governing the church by its ministers which the Lord appointed to be of perpetual continuance" (iv. 3, 1-3)—but the manner in which the ministerial office is divided is to some extent in his mind a matter of argument and "apprehension." The same elasticity and desire for adaptation may often be noticed in his words, as, for example, when on the very question of election of ministers, whether it should be by the congregation or not, he says, "We must be guided in this respect by times and circumstances" (Henry, i. 371).¹ Nor does he put forward any theory as to the details—the number, method of choice, or period of office. All these he leaves to each individual church. (4) He does not include synods as necessary. Should controversy arise respecting doctrine (iv. 9, 13), there is no better or more certain remedy, he says, than to assemble a council of true "bishops," in which the controverted doctrine may be discussed. Regarding the question historically he gives to the ancient councils a modified approbation, but he denies the power of councils to frame new doctrine.

With regard to the relations between the church and

the state, Calvin was utterly opposed to the Zwinglian Calvinon theory, whereby all ecclesiastical power was handed over to the state. The political administration, he says, is as necessary to human weakness as are food and light and air; but it has not the right to legislate for religion or divine worship, though it must take care that the gospel religion is not insulted or injured. "The church of God stands in need of a certain spiritual polity, which, however, is entirely distinct from civil polity, and is so far from obstructing or weakening it, that on the contrary it highly conduces to its assistance and advancement" (iv. 11, 2). "The church does not assume to itself what belongs to the magistrate, nor can the magistrate execute that which is executed by the church." Thus, the magistrate imprisons a man for drunkenness; the church excommunicates him, and regards him spiritually as an outlaw. Should he repent, the magistrate takes no cognizance of his repentance, but the church can do so by allowing him to return to communion. The magistrate makes laws, and God makes laws; the breach of the one is a "crime," that of the latter is a "sin," though perhaps no crime; it is with the sin that the church deals. The magistrate may neglect to punish magisterially; the church, with spiritual penalty, supplies the neglect.

But, though the church disclaims interference with the domain of the state, she expects the state to support her. Indeed, while Calvin utterly abjures the thought of an *imperium in imperio*, while he spends much labour in showing how the papacy, by continual encroachments, secured the civil power, and in condemning this confusion of two distinct spheres of action, the function of giving support to the church is in the Calvinistic system really the *raison d'être* of the state. In a very remarkable passage (iv. 20, 3) Calvin's position is clearly shown. A well-ordered state, that for which the best of the popes strove, is a theocracy. There can be no question as to what doctrine is right, for the law of God, the only possible doctrine, is plainly stated in the Bible. That law is the highest thing that a state can regard; it is indeed the very life of the state, and the position of the state towards the church follows at once. The words "toward the church" alone introduce the difficulty. They should be "toward God." If the state fail to support the church, it fails to support, not a human, but a divine organization. In the infliction of punishments, for example, the magistrate should regard himself merely as executing the judgments of God. So that the objection of the *imperium in imperio*, the assertion that the church claims spiritual liberty independent of the judgment of the state, while at the same time insisting on the support of that state whose authority she thus disregards, falls to the ground. The civil magistracy is as much a divine institution as is the ministry of Christ; the state and the church are as much one as are the veins and the blood which permeates and vivifies them.

The fallacy in all this is obvious. The argument necessarily presupposes a theocracy, and such a thing did not exist in Europe. A state church, claiming at once independence of the state and support from the state, must bring about contest and complication where the state is not prepared to recognize the claim. The *imperium in imperio* difficulty (expressed most briefly by James I.'s "No bishop, no king") arises acutely at once, however much the church may refuse to admit it. This was the case in Scotland. And where, as was the case in France, it is not a state church but a union of persons holding a religion, and therefore views on important matters, which differ from those of the Government, oppression must arise in an age ignorant of religious liberty, and the oppressed will become a *political* party opposed to the Government, however much they may disclaim the position.

¹ On the question of the *jus divinum* of the eldership, see Lorimer, *On the Eldership*, especially the tract therein by James Guthrie, who first suggested the idea in the middle of the 17th century, and two papers in the *Records of the First General Presbyterian Council, 1877* (pp. 52, 98), by Dr Cairns and Professor Lee, in the latter of which it is stated with wonderful confidence that "Calvin himself holds that we may rest the doctrine of a divine warrant for the ruling eldership on the ground mentioned in *Inst.*, iv. 3, 8."

It can now be seen how far Calvin was able to carry out his theory. But for his life the theory, like those which preceded it, would probably have had no universal historical interest.

Calvin's
relations
with
Geneva.

The course of events in Geneva had developed a theocratical feeling; and the essence of a theocracy seemed gained when the citizens were summoned by tens in 1536 to swear the confession contained in Calvin's first *Catechism* (really an analysis of the *Institutes*). They swore as citizens, and those who refused lost their citizenship. As soon, however, as Calvin attempted to make this a reality trouble followed. His ruling idea was discipline, and this was exercised against both the moral and the spiritual libertines,—against those who objected to the discipline of manners and those who disliked submission to the confession. As the reins were drawn tighter these two bodies gained influence in the council, and inveighed against the new popedom. At length, in 1538, when Calvin, Farel, and Conrad refused to give the communion in a city which, as represented by the council, would not submit to church discipline, the storm broke out. The three preachers were banished, and Calvin retired to Strasburg. This refusal of the sacrament is important as a matter of ecclesiastical history, because it is the essence of that whole system which Calvin subsequently introduced, and which rests on the principles that the church has the right to exclude those who, according to her judgment, appear unworthy, and that she is in no way subject to the state in matters of religion. For the present the state had refused to admit the claims of the church. Calvin laid down as the conditions of his return the recognition of the church's independence, the division of the town into parishes, and the appointment by the council of elders in each parish for excommunication. The feeling, however, was for three years too strong; the banishment was confirmed on the specific ground that the insistence on excommunication was an attempt at despotic power. Calvin's absence left the town a prey to anarchy: one party threatened to return to Romanism, another to give up their independence to Bern. It was felt to be a political necessity to recall Calvin, and in 1541 he returned on his own terms. Meanwhile he had been maturing and carrying out his system (*Inst.*, iv. 8) in the French and Walloon churches in Strasburg.

Church
organiza-
tion at
Geneva.

By the *Ordonnances Ecclésiastiques de l'Église de Genève*, which represent the terms on which Calvin consented to be pastor in Geneva and which were published on 20th November 1541 in the name of Almighty God by the syndics, the small and great councils, and the people, there are, as in the *Institutes*, the four orders,—pastors, doctors, elders, deacons. (1) The pastors preach, administer the sacraments, and, in conjunction with the elders, exercise discipline. In their totality they form the "vénérable compagnie." It was the duty of each minister, with the elders of his parish, to be diligent in house-to-house visitation, to catechize, and, generally, to supervise family life. After being approved as to knowledge and manner of life, and ordained by the pastors already in office, and settled in a fixed charge by the magistrate with the consent of the congregation, the newly-made pastor vowed to be true in office, faithful to the church system, obedient to the laws and the civil government (with reservation of freedom in doctrine and the rights of office; compare Becket's "saving our order"), and, in especial, to exercise discipline without fear or favour. (2) The doctors teach the faithful in sound learning and guard the purity of doctrine. They too are subject to "discipline." (3) The work of the elders ("Anciens, Commis ou Députés par la Seigneurie ou Consistoire") Calvin regarded as the sinew and essential substance of the system. They were the bond of union

between church and state, and therefore the most important element of the theocratic government. Their business was to supervise daily life, to warn the disorderly, and to give notice to the consistory of cases requiring church chastisement. They were nominated by the small council and confirmed by the "two hundred." Two were chosen from the small council, four from the "sixty," eight from the "two hundred"; some were to live in each quarter, that the whole might be well supervised. After a year's probation an elder might be dismissed or confirmed by the small council. If confirmed, he held office for life. To form the "consistoire" or church court, all the elders, with the pastors, met every Sunday under the presidency of one of the four syndics. This court was erected purely as a means to secure discipline. It could award punishments up to exclusion from the sacrament. It had, too, great authority (with appeal to the civil Government) in marriage questions. An officer of the Government was placed at its disposal to summon persons before it; should they refuse to appear, the Government itself compelled attendance. Moreover, the consistoire was bound to give notice of every excommunication to the Government, which attached to it certain civil penalties: "et que tout cela ne face en telle sorte que les ministres n'ayent aucune juridiction civile et que par ce consistoire ne soit rien derogué à l'autorité de la seigneurie, ni à la justice ordinaire, ainsi que la puissance divine demeure en son entier."

The inevitable quarrel arose in 1546-53, when the council overruled the decision of the consistory in a question of excommunication. The deniers of the autonomy of the church referred to the clause which laid down that excommunications were to be notified to the small council; but Calvin argued that the aim of this was merely that in extreme cases the Government should support the action of the church, not criticize it, and he won the victory. His position gradually became stronger. In 1557 banishment was awarded to any one who contemned the sacrament or the sentence of the consistoire. In 1560 it was ordered that the names of the elders should be published, *honoris causa*; and in the same year the appearance of state control, by the presence of a syndic with his staff of office at the consistoire, was done away with. He was present, but not officially as a syndic, and without his staff.

It should be noticed (1) that the provision that in certain cases the censure of the consistoire should be followed by civil penalties is in keeping with the theocratic view. So too is the provision that members of political bodies alone were eligible to the eldership. The rights of the church as distinct from the state authority were preserved by the condition that the meeting of the consistoire was summoned by the ministers. (2) In the *Institutes* ecclesiastical power is ascribed to the congregation, to be exercised by foreknowledge of and in agreement with the acts of the ecclesiastical jurisdiction. But in the *Ordonnances* the congregation as a unit is passed over in silence as regards discipline and the choice of elders. (3) It must be remembered that Calvin never professed to regard this as a perfect plan, but as good as under the circumstances he could hope for. It was a compromise, and showed the practical character of the man. If he could secure the essence of his longed-for church discipline he was willing to waive the question of privilege.

To sum up the characteristics of early Presbyterianism—(1) It is an organization for discipline. Whatever else they may be, the elders of the Reformed churches are, primarily, censors of morals. (2) The institution claims the triple ground of Scripture, history, expediency. (3) The Lutheran doctrine of universal priesthood was wanting. (4) No voice is raised for the choice of elders by the congregation. As to *eligibility* there is as little anxiety:

Brenz says, "from among the citizens"; Œcolampadius and Capito, partly from the Government, partly from the congregation; Calvin theoretically leaves it unsettled, but in practice gives it only to the political bodies. As to *period of office*, Capito wishes for regular change; the rest leave it in theory undetermined. Geneva retained permanence as the rule and change as the exception. (5) Synods have no place except with Lambert.

Lasky. In 1549 Lasky, who had established a flourishing church at Emden, was driven to London. There in 1550 he became superintendent of the foreign congregation, which was independent of the state church, but which was intended by the king to serve as a model to be followed when England should be ripe for reform. This church was in two congregations, French and German. The French kept the Genevan system, the German a modification of it. In this latter the ministers, elders, and deacons were chosen by the written votes of the congregation, with revision and final decision by the officers already existing, though any objection on the part of the congregation must be duly considered. The strictest discipline was carried out. Not merely the congregation but the ministers also were subject to the elders. Every three months ministers and elders came together for mutual censure. Deacons were subordinate to the elders. The eldership was for life, the diaconate for a year. The essential difference between this and Calvin's system is that here the congregation has a very real though a limited share in the choice of the officers; the ground-work of Lasky's principle is subdued Congregationalism. Lasky held also that the ministers should have a *fixed* president, selected from themselves. This office he regarded as a permanent one. Under the Marian persecution the London system found in a modified form a new home in Frankfort and on the lower Rhine. At Frankfort, in the French congregation, in choosing elders, the church council selected twice as many names as were wanted, and out of them the congregation made its choice.¹

Scotland. *Scotland.*—The initial conditions of Scottish Presbyterianism are seen in the historical facts—(1) that the Reformation was the form taken by the triumph of a violent and grasping aristocracy over the encroachments of the sovereign and an alien church; and (2) that John Knox was its spiritual leader. Under his advice the Protestant nobles in December 1557 formed themselves into a covenanted body called "The Lords of the Congregation"; in 1559 Perth declared itself Protestant, and Knox's sermon there on 11th May was the manifesto of revolt. In 1560, being hard pressed, the lords concluded with England the Pacification of Berwick, and a few months later the treaty of Edinburgh, whereby the whole government was placed in their hands.

Organization of the Presbyterian church. To the parliament which now assembled a petition was addressed, praying (1) that a "true kirk of God" and the sound doctrines of the Reformation might be established, (2) that the true discipline of the ancient church might be restored, and (3) that the ecclesiastical revenues might be applied to the support of the ministry, schools, and the poor. Meanwhile the Reformers garrisoned, as it were, the country. Under Knox's agency Edinburgh, St Andrews, Aberdeen, Jedburgh, Perth, Dunfermline, and Leith had fixed ministers appointed, whilst wider districts were placed under superintendents or travelling ministers. To

meet the first prayer of the petition Knox and five other ministers drew up a scheme of doctrine and discipline. The *Confession of Faith*, produced within four days and ratified by the three estates on August 18, 1560, was naturally aggressive and uncompromising. It expresses abhorrence especially of the blasphemy of them "that affirme that men who live according to equity and justice sall be saved what religioun soever they have professed," and of all the doctrines of the Anabaptists. The civil magistrate is appointed for the "suppressing of idolatrie and superstition whatsoever." Above all, no mercy was to be shown to Catholicism: the celebration of mass was to be punished by death. To accomplish the second prayer of the petition the Reformed ministers and the leading Protestant nobles met at Edinburgh on 20th December 1560. This was a purely church meeting; parliament had in it no part whatsoever. Even in its birth the Scottish Church announced its independence. It will, however, be observed that there were in the forty-six members comprising it but six ministers. At this assembly was drawn up the *First Buik of Discipline*, which, though not accepted by the privy council, was on 27th January 1561 signed by the great majority of the members, and by the chiefs of the great Protestant families, on the noteworthy condition that the deposed prelates were allowed to enjoy their benefices during life. This book, which was a grand effort to reconstruct society, and for which, its authors asserted, "they took not their example from any kirk in the world,—no, not from Geneva," was nevertheless on the Genevan principle. It deals solely with the congregation; the idea only of synods may be traced. As regards the relations of church and state, the eldership, and the economy of the church generally, especially the supervision of life and manners, its views are those of Calvin. Doctors or teachers are not mentioned until the edition of 1621, published by Calderwood in Holland. The order of deacons was of the utmost service in poor relief. It was abolished, of course, at the Restoration, and the want of it was shown by the fact that in 1688 one-fifth of the population were beggars. Upon the restoration of Presbyterianism the evil was again grappled with, and in 1709 so great a change had taken place that the justices of the peace were instructed to leave the whole question of poor relief to the kirk sessions.² Besides the regular orders there were two others, called for by the exigencies of the situation, *superintendents* and *readers*. The latter of these was temporary, lasting only until 1581; it was required by the lack of highly-qualified men for the ministry. Readers were appointed to read the common prayers and the Scriptures; in process of time they might become ministers. The superintendents travelled through their districts—of which there were to be ten—establishing churches, settling ministers, and generally putting the church in order. Moreover, commissions were given, lasting for a year only, for special needs. It has been asserted that this office of superintendent was also intended to be temporary; but it is not stated so, as in the case of the readers; on the contrary, the whole language points to permanence. It is obvious that it is only by the most strained use of language that this institution can be used as an historical argument for Episcopacy in any modern sense. Not only was the superintendent in all respects subject to the same rule as his brethren, but in the last exhortation upon election he is strictly charged, "Usurpe not dominion nor tyrannical authority over thy brethren." In June 1562, however, subjection of ministers to superintendents, as far at any rate as receiving admonition, was enacted; and in December 1562 the superintendent received the power, *with the consent of the majority of the ministers in his district, to trans-*

late ministers. In 1565 his functions increased vitally; he might then call a disobedient minister before himself, accompanied only by the nearest discreet ministers, who might suspend the delinquent from ministry and stipend until the next general assembly. In 1575 it was ordered that superintendents should be elected yearly, to avoid ambition.

Care was taken to preserve the rights of the congregation: "It apperteaneth to the Pepill, and to everie several congregation, to elect their minister. . . . Altogether this is to be avoided that any man be violently intruded or thrust in upon any congregation." But, once elected, he is irremovable, except for heinous crimes or by the majority of the whole kirk. Of course he is strictly "examined" as regards both "lyiff and maneris" and "doctryne and knowlege," and especially as to his grasp of the chief points of controversy with Papists, Anabaptists, &c. No special method of nomination of elders is laid down, but from those nominated the whole congregation is to choose, special care being taken "that every man may gyf his vote freeilie." The liberty of the churches is preserved by making the elections of elders and deacons annual. The affairs of each congregation were managed by the kirk session (French "*consistoire*"), which met at least once a week. In every considerable town another weekly meeting was held, called the "exercise of prophesying," which in course of time became the presbytery or classical assembly (*colloque*). It was formally erected in 1579, and generally introduced in 1581. Then, again, the superintendent, with the ministers and delegated elders of his district, formed what developed into the provincial assembly. To this any one aggrieved by the kirk session might appeal, and, if necessary, the appeal went to the general assembly. This right of appeal was given in 1563. The general assembly, composed of delegated ministers and elders, into the constitution of which a change similar to that in France in 1565 was introduced in 1568, met as occasion served.

A splendid educational system was sketched. Parish schools, where grammar and Latin should be taught; colleges in every important town, with professors of logic, rhetoric, and the tongues; universities at Glasgow, St Andrews, and Aberdeen,—such was what Knox desired. (The parish schools were not established till 1696.) The principle was affirmed that education was the affair of the state. "No fader, of what estait and condition that ever he be, use his children at his own fantasie, especially in their youthheade, but all must be compelled to bring up their children in learnyng and virtue." Compulsion and free education for the poor were Knox's idea. In 1567 parliament compelled patrons who had "provestries, prebendaries, altarages, or chaplaincies at their gift to present bursars to them to studie in anie college or universitie of this realm."

To carry out these schemes and one for composition of tithes Knox proposed to apply the revenues of the disestablished church. But he was completely baffled by the nobles, who hastened to divide the spoil. The absolute irreconcilability of the views of these feudal barons, who were Reformers because their supremacy was threatened by crown and church, and because they coveted the abbey lands, with those of Knox and his fellow-labourers was at once brought into strong relief. His petitions were disregarded; the privy council would not ratify the *Book*; the lords determined that "the kirkmen shall intromett with the 2 parts of their benefices, and the third part be lifted up to the ministers' and Queene's use," or, as Knox bitterly said, two parts were "freeilie given to the Devill" and the third part was "divided between God and the Devill." Even the sixth part allowed to the ministers was irregularly paid, a leading subject of complaint for many years. Knox's next struggle was to maintain the right to hold

assemblies, the independence of which was the essence of the kirk's existence. Against Mary's able secretary, Maitland of Lethington, he threw himself with his whole vigour into this vital contest, and so far won the day that all Mary could gain was the compromise (important in principle) that a representative of the crown should have a place in the meetings.

The next struggle was on the question of patronage. The church requested that the vacant benefices, about 200 in number, might be filled by duly qualified persons. Mary answered that she would not give up her right of patronage. The church replied that no claim was made on this right, only it was desired that the places should be filled, and that the church should have the right of collating, after approval by examination, those presented by the crown or patron. The church, in fact, was compelled to admit the principle of lay patronage. This was accepted in 1567, and no change was made until twenty years later, when all church lands not already bestowed inalienably on the nobles were annexed to the crown. James VI. gave these lands lavishly away with their patronages, which thus became lay patronages. Charles I. and Laud used their best efforts, but in vain, to regain them. The church protested until March 1649, when lay patronage was altogether abolished. It was naturally restored at the Restoration, and remained until the Revolution. On 19th July 1690 the system was again abolished, and the nomination to a vacancy was placed in the hands of the Protestant heritors and elders with a veto to the whole congregation. In 1712, under the influences of the Jacobite revival, the English parliament reimposed lay patronage. This Act, as violating the Act of Security, has never been admitted as valid by the purer Presbyterians.

During the troublous years 1566-67 the kirk, stable in a time of confusion, consolidated her strength, and within her own bounds established the strictest discipline. In 1567 parliament made the monarchy Protestant, ratified the rights of the church to collation, and established the important principle, resisted from time to time, that the "thrlds" of benefices should be henceforth collected by persons nominated *by herself*, and that she should pay the surplus into the exchequer after satisfying the ministers' stipends. Her progress may be gathered from the fact that, while in 1560 the general assembly contained only 6 ministers and 34 laymen, in 1567 she contained 252 ministers and 467 readers. Her power is seen in the censure passed upon the countess of Argyll, the earl being the most powerful of the nobility, for assisting at the baptism of Mary's son with Catholic rites.

To the nobility, which retained the old turbulence of feudalism that had long ceased to be tolerated in any other country in Europe, this power of the church was hateful, and after the death of Murray their enmity became outspoken. Morton, acting under English influence, led the attack. In 1571, the Roman Catholic archbishop of St Andrews having died, Morton obtained a grant of the archbishopric and of the two-thirds of his revenues disposable, and, by appointing a minister on condition that he himself should retain the greater part of the income, gained a strong footing within the church. In January 1572 the earl of Mar got together the superintendents and some ministers at Leith, on pretence of consultation. This convention, under the influence of the nobility, assumed the functions of a general assembly, and restored the titles of "archbishop" and "bishop" and the bounds of the dioceses, on the conditions that they should be chosen by a chapter of learned ministers, that they should have no more power than the superintendents, and that they should be subject to the general assembly in spiritual matters. These were the "tulchan" bishops. The general

assembly of August 1572 was not strong enough to resist. The effect of this arrangement, however, was to rob Episcopacy, as a system, of all title to respect. It soon became the earnest belief of all who were truthful and independent in the nation that the Presbyterian system was the one divinely appointed mode of church government, from which it was sinful to deviate in the slightest degree.

Andrew
Melville.

In 1574 Andrew Melville appeared on the scene, and, by steady persistence and firm defiance of Morton's violence, gave fresh life to the church. The *Second Book of Discipline*, sanctioned by the general assembly in April 1578, and ordered in 1581 to be registered in the acts of the church, represents her determination to repel the aggressions of the nobility. It was decreed that no more bishops should be appointed, that the existing ones should be called by their own names, not by their titles, and that they should submit to the general assembly for disposal.

The *First Book of Discipline* occupied itself chiefly with the congregation, the *Second Book* with the dependence of the congregation upon higher courts. It did away with superintendents and established complete parity among ministers, transferring discipline and authority from individuals to bodies of men. These were four. (1) The kirk session, which in 1587 was ordered to be subject to the presbytery. (2) The presbytery or eldership, which had the oversight of a number of neighbouring congregations, and consisted of all the ministers of the district, and as many elders as congregations, so that clergy and laity were equally represented. It had authority to control the kirk session, try candidates, ordain or depose ministers. It constituted, in fact, the prominent feature of the system. (3) The provincial synod, composed of all the members of the presbyteries in its district, had jurisdiction of appeal over these presbyteries. (4) The general assembly, consisting of ministers and elders, chosen, be it observed, not from the provincial synod, but from the presbytery. Thus the presbytery took the same commanding position in Scotland as, it will be seen, the provincial synod did in France. The importance of these church courts politically, in the organization which they effected of the middle classes against the aristocracy, cannot be overrated.

The ruling elder was now to hold office for life,—an important limitation of the power of the congregation. The general tendency henceforward, natural in a complex society, was towards centralization; the rights of the congregation were gradually diminished, those of the presbytery increased. This tendency was strengthened as time went on by the passionate hatred of the Presbyterians for the congregational system. Thus in 1639 Baillie declares that if the congregation is to have a veto upon the appointment of the minister it is "sheer Brownism" (vol. i. p. 241); and on 30th July 1643, although "William Rigg and the people" were against an appointment, the intruder was decreed by the general assembly to be admitted, since the patron, presbytery, and provincial synod were in favour of it. As the position of elder increased relatively to that of simple members of the congregation, so the position of minister increased relatively to that of elder. The supremacy of ministers and the subordination of the elders reached their height after the great rising of 1638.

The contest which was waged during 1582-84 between the kirk and the crown was chiefly concerned with the denial by Melville of the primary jurisdiction of the privy council over ministers summoned for offences committed in their ministerial capacity. He demanded in his own case to be tried, in the first instance, by the ecclesiastical courts. A more important case of the same claim, because connected with less important persons, occurred in 1591, and the demand of the church was allowed so far that the offender was tried in both courts concurrently. In May 1584 the par-

liament met secretly and, having been thoroughly corrupted by the court, passed the "Black Acts." Act 2 declared Melville's claim to be treason; Act 4 forbade presbyteries, synods, and assemblies, as being not allowed by parliament; Act 20 re-established Episcopacy and made it treason to speak against any of the three estates (e.g., bishops). The king was made supreme in all cases and over all persons, while none were to presume "to meddle with the affairs of his Highness and estate." The course of events from 1584 to 1592, the fear of Catholic Spain, the league with England, and especially the ability of Robert Bruce led to a settlement, by which in May 1592 Presbyterianism was restored and ratified by parliament. It was of course a compromise, as is shown in the provision that, if a presbytery refuse to admit a qualified minister, the patron may retain the income.

The quarrel, however, was not to be settled. For re-Struggle jecting the bill of attainder against the popish lords the with the synod of Fife excommunicated James and convened a crown. meeting from the whole kingdom to complain of his conduct. A little later Andrew Melville, when sent on a deputation, called James "God's silly vassal," and told him that there were two kings and two kingdoms in Scotland, King James the head of the commonwealth and Christ Jesus the head of the church, whose subject he was. James, however, was strong enough to remain inflexible and to secure a victory on the question of the church courts, which, in the case of David Black, one of the ministers of St Andrews, who had in a sermon reflected upon the queen and Church of England, had arisen in its most acute form.

Two alternative steps were now suggested for preventing future strife, the establishment of Episcopacy or the admission into parliament of representatives of the church without any title or jurisdiction derived from the crown. In a general assembly opened at Perth on 29th February 1597, and packed with ministers from the remote northern presbyteries, where the democratic spirit of the High Presbyterians of the South was unknown, James obtained leave to suggest in a future assembly alterations in the existing government of the church, a disapproval of the discussion of state questions and of the denunciation of individuals from the pulpit, and the forbidding of extraordinary conventions. Ministers were also to confine their discourses strictly to their own congregations, and summary excommunication was abolished. He had previously with a high hand put down the opposition of the Edinburgh ministers, Bruce and others seeking safety in flight.

In April, at Dundee, an assembly similar to that of Perth consented that commissioners should be appointed to advise the king on church affairs, which step in a great degree freed him from the general assembly. These commissioners were easily induced to petition that the church might be represented in parliament. Parliament thereupon passed an Act allowing those to sit there who might be appointed by the king, as bishop, abbot, or other prelate, the duties of their offices to be determined in conference with the assembly. At the second assembly of Dundee, however, which met on 7th March 1598, and at which Andrew Melville was refused admittance by James on frivolous though legal grounds, it was resolved that fifty-one representatives of the church, chosen partly by the king and partly by the church, should vote in parliament. At a convention held at Falkland on 25th July, at which three representatives of each synod and six doctors of the universities were present, it was decided that the representatives should be nominated by the king out of a list of six as vacancies occurred. They were to be responsible to the general assembly, and were to propose nothing unless instructed to do so by the church. Of these two

plans, the parliament's and the church's, James greatly preferred the former; to induce the church to agree to it he held a conference previous to the general assembly at Montrose in 1600, but in vain. At Montrose the assembly put limitations to the plan of the Falkland convention by insisting that their representatives should sit but for one year, and that at the end of that year they should resign and account for their conduct to the assembly, which might depose them. They were to be called commissioners only. Six were to be nominated for each province, from whom the king was to choose one. The commissioner was to have no power above that of other ministers, was to perform full pastoral work, and was to lose his vote in parliament if deposed from the ministry.

James at length took a decisive step. On 14th October 1600 he summoned a convention of commissioners from the various synods, and by some means secured its consent to the appointment of three bishops in addition to those formerly nominated and still living. They took their seats and voted in parliament next November; but the church, disowning the authority of the convention, refused to acknowledge the appointment as valid, and assigned them no place in her own organization. The quarrel became intensified when James was master of the power of corruption with English money. The proposals for union between the kingdoms at once brought out the views of the church. "The realmes," said Melville, "could not be united without the union of the kirk; neither could the kirkes be united in discipline, the one being Episcopal and the other Presbyterian, unless one should surrender to the other." When James twice prorogued the meeting of the general assembly nine presbyteries met at Aberdeen in defiance. The Government at once struck hard: eight ministers were banished to remote charges and six to France. Next followed the alienation of church lands and revenues and their erection into temporal lordships, the re-establishment of seventeen prelaties, and the restoration of the bishops. The immense step was taken of recognizing the king as "absolute prince, judge, and governor over all estates, persons, and causes, both spiritual and temporal." In 1606 another packed assembly declared for constant moderators of presbyteries and for the supremacy of the bishops in their own presbytery and provincial synod. In 1609 the bishops gained the right of fixing ministers' stipends. In 1610 courts of high commission with most arbitrary powers were erected at Glasgow and St Andrews; and in June the general assembly placed the whole ecclesiastical power in the king's hands. In 1618, under threats of violence, the general assembly of Perth passed the Five Acts, which enforced kneeling at communion, observance of holy days, Episcopal confirmation, private baptism, and private communion. These were ratified by parliament on Black Saturday, 4th August 1621. Thus matters remained until the death of James.

Almost the first act of Charles I. was to proclaim the strict observance of the articles of Perth. In November 1625 he revoked all the Acts of his father prejudicial to the crown, as a first step toward the resumption of the church lands. This, of course, met with the vehement opposition of the nobility, and the scheme in the end had to be given up. In 1630 Maxwell, in Laud's confidence, was sent to Scotland to try to force upon the people the English liturgy. It is significant of the change in feeling that a paper of grievances sent in by ministers was supported by several of the nobility. Their hatred was always directed to the nearest enemy, against the crown before the Reformation and during its early stages, against the Reformed Church of late years, now against the crown again. In 1633 Charles came to Edinburgh and forced through the convention the "Act anent his Majesty's Pre-

rogative and Apparel of Churchmen," a combination of two Acts passed in 1606 and 1609 respectively. All protests were disregarded and the whole nation was thrown into a state of anger and disappointment. The attack on Balmerino still further alienated the lords. In 1635 diocesan courts were erected with the most vexatious powers, and the *Book of Canons*, subversive of Presbyterianism and insulting in language, was distributed; and in 1636 the people were ordered to adopt Laud's book of public worship; while in July 1637 the prelates obtained an order of outlawry against ministers who should be backward in receiving the liturgy. As Baillie said, they were like to go "to Rome for religion, to Constantinople for policy." On 23d July, however, the outburst of St Giles's took place. The history of the great rising cannot be traced here. The National Covenant, which was its outcome, drawn up by Alexander Henderson and Johnston of Warriston, consisted of the *Second Book of Discipline*, a recapitulation of the Acts of Parliament condemning Popery and ratifying the acts of the general assembly, and the application of the whole to present times.

After some months of trickery and evasion, frustrated with firmness and ability by the Covenanters, the general assembly met on Wednesday, 21st November 1638. When they determined to sit in judgment on the prelates, Hamilton, the king's commissioner, dissolved the assembly. It, however, continued its sitting, refused to acknowledge the assemblies which had introduced prelacy, condemned the Acts of Perth and all the late innovations, and abjured all Episcopacy different from that of a pastor over a particular flock. Baillie alone made a stand for not rejecting Episcopacy as represented by the superintendents of Knox's time. Eight prelates were excommunicated, four deposed only, two reduced to the simple pastorate. All church assemblies were restored, and the principle that the consent of the congregation was necessary to a minister's appointment was re-enacted. Schools and schoolmasters were at once to be provided. In August 1639 an Act was passed, called the Barrier Act, that no change should be made in the laws of the church until the proposal had been submitted to all provincial synods and presbyteries.

The church was now secure. She had gained the day, because on this occasion the zeal of her ministers and the interests of the nobles had been both enlisted in her service. The victory had been won in her name and the influence of her ministers was vastly increased. For the spiritual tyranny which they introduced the reader should refer to Mr Buckle's famous chapter; or, if he think those statements to be partial or exaggerated, to original records, such as those of the presbyteries of St Andrews and Cupar. The arrogance of the ministers' pretensions and the readiness with which these pretensions were granted, the appalling conceptions of the Deity which were inculcated and the absence of all contrary expression of opinion, the intrusions on the domain of the magistrate, the vexatious interference in every detail of family and commercial life and the patience with which it was borne, are to an English reader alike amazing. "We acknowledge," said they, "that according to the latitude of the word of God (which is our theme) we are allowed to treat in an ecclesiastical way of greatest and smallest, from the King's throne that should be established in righteousness, to the merchant's ballance that should be used in faithfulness." The liberality of the interpretation given to this can only be judged of after minute reading.

Up to this point the Kirk had worked out her own salvation; the problem had been purely Scottish; henceforward her history is in close connexion with that of England and assumes a different complexion. Her first difficulties, however, arose in her own midst. Under the

prelatic rule conventicles had arisen, which after the restoration of Presbyterianism caused great searchings of heart. Whatever he had to say about popery, prelacy, or arbitrary power, the true Presbyterian reserved his fiercest hatred and his most ferocious language for anything which savoured of Congregationalism. At the instance of Henry Guthrie, who under Charles II. became a bishop, the general assembly of 1640 limited family worship to the members of each family, and forbade any one to preach who was not duly ordained and approved. This was but the beginning of dissension.

Passing over the events of the next six years, as coming more conveniently under the head of England, we notice that the moment external danger was removed the natural and abiding antipathy between a licentious and entirely selfish aristocracy and a masterful, censorious, and democratic church broke out. Two parties showed themselves,—that of the ministers, who insisted that no arrangement should be come to with Charles unless he would take the Covenant (compare the French “consistoriaux”), the other, headed by Hamilton, Lanark, Lauderdale, and others, who “engaged” to raise an army for him on condition, ostensibly, that he would confirm Presbyterian church government for three years. The real conditions, as long believed but only just discovered,¹ contain not a word about the church, but are entirely concerned with the privileges of the Scottish nobility. A vehement disruption of the church at once took place and did not cease until the defeat of Hamilton. Then the ministers were once more masters. Parliament repealed the Act of Engagement and passed the Act of Classes, whereby all those to whom the church deemed it inexpedient to give political power were registered in four classes according to their faults. It was by this parliament that lay patronage was abolished, and that the rights of the congregation as to election of ministers were settled for the time. After the battle of Dunbar, when troops were being hastily raised, the Act of Classes stood much in the way. In spite of the remonstrances of Patrick Gillespie and the western Covenanters, the commission of the assembly (which sat *en permanence* during the recess of the assembly itself) resolved to allow all persons to serve who were not professed enemies to the Covenant or excommunicated. The parliament went further and rescinded the Act of Classes altogether. Against this union of the church with the “malignants” Gillespie’s faction protested, and henceforward the rivalry and bitterness between Resolutioners and Protesters, the latter being favoured by Cromwell, deprived the church of much of its power of resistance. Both parties, absorbed in their quarrel, looked on while Monk, after the battle of Worcester (1651), took the matter into his own hands by refusing to allow any general assembly whatever to meet, though he permitted the continuance of the other assemblies.

Within two years of the Restoration the Presbyterian Church ceased to exist. Weariness, internal dissension, the indifference or positive hatred of the nobles, and the extremity of treachery in James Sharp² brought about the downfall. The steps by which Episcopacy was restored were these. The leaders of the strict Covenanting party were imprisoned, while a quibbling proclamation was issued by Charles which served to keep the Resolutioners in play. Proclamations were issued against all unlawful meetings, and papers such as Rutherford’s *Lex Rex* and Guthrie’s *Causes of God’s Wrath* were called in. In January 1661 a bribed and packed parliament passed an oath of allegiance in which the king was acknowledged as supreme over all persons and in all causes. With scarcely an exception,

Cassilis being the only one of note, the nobility took the oath. Next the acceptance of the Solemn League and Covenant was declared null and void, and its renewal was prohibited. And, by way of clearing the field entirely, a Rescissory Act was passed annulling all the parliaments since 1633 and thereby suspending the Presbyterian system. The parliament then declared that the church government was to be such as was most agreeable to the word of God, to monarchical government, and to public peace; remonstrances were disregarded and synods suppressed or corrupted. Argyll and James Guthrie were judicially murdered. Finally, on 14th August 1661, Episcopacy was restored by proclamation; Sharp, Fairfoul, Hamilton, and Leighton were consecrated in London; and on 2d January 1662 all Presbyterian assemblies of every sort, unless authorized by the prelates, were forbidden. On 8th May the proclamation was enforced by Act of parliament. All religious covenants and leagues, protestations and petitions, were made treasonable, nor might any one be professor, minister, schoolmaster, or private tutor without a bishop’s licence. On 5th September 1662 the abjuration of the National Covenant and all other religious covenants was made a condition for public trust. Finally, the Act of Indemnity, which had been delayed as long as possible, contained a schedule of persons of the Presbyterian interest who were punished with heavy fines. Dangerous ministers were banished from Edinburgh and all were ordered to attend the bishops’ courts when summoned, while by the Glasgow Act ministers who had taken charges since 1649 were ousted from home, parish, and presbytery unless before 1st November they obtained presentation from the patron and collation from the bishop. This led to the ejection of 400 ministers. Ejection led, of course, as in England, to conventicling, and on 17th June and 13th August 1663 severe Acts were passed against these meetings. Presbyterian ministers from Ireland were forbidden to reside in Scotland, and absentees from public worship were vigorously proceeded against. The system of persecution was now complete, and the triumph was signalized by the execution of Johnston of Warriston, who had been kidnapped in France and who was now put to death with flippant cruelty. In 1664, at the suggestion of the archbishops Sharp and Burnet, a court of high commission was erected with unlimited powers.

Revolt soon followed; it was crushed at Pentland and ruthlessly punished. But the nobles speedily became jealous of the growing power of the prelates. Lauderdale in especial saw his influence threatened. He reported to Charles that Prelacy was becoming as great a danger to the crown as Presbyterianism had been, “so unwilling are churchmen, by whatever name they are distinguished, to part with power.” Sharp was easily threatened and cajoled, and Burnet, after a struggle of three years, was forced to resign. It was not, however, until after the fall of Clarendon in 1667 that indulgence was seriously tried there as in England. In July 1669 ten ministers, of whom Hutcheson was the chief, who were willing to admit the ecclesiastical supremacy of the king and to accept the bishops’ collation, were allowed to return to their livings, and were henceforth known as the “bishops’ curates.” This subservience caused a renewal of the breach in the church; from henceforward the feud between the “Indulged” and the “non-Indulged” took the place of that between Resolutioners and Protesters. Forty-two ministers accepted the indulgence. A second indulgence followed in 1672. From Lauderdale’s marriage with Lady Dysart until 1687 there ensued a policy of extermination, borne with marvellous fortitude. To Covenanters had succeeded Protesters, to Protesters Conventiclers, to Conventiclers now succeeded Hamiltonians, to Hamiltonians

² For proof of his active participation in the re-establishment of Episcopacy, see *Lauderdale Papers*, vol. ii., App. III.

Cameronians or Society People. Want of space prevents us from giving even the names of a series of Acts which would disgrace any nation however barbarous, in any age however intolerant, and under which, it is asserted with great probability, 18,000 persons died. In February 1687 James II. proclaimed indulgences to moderate Presbyterians as far only as regarded private worship. By the same proclamation the profession of Roman Catholicism was made absolutely free. In March a more extended indulgence and in June the suspension of all penal laws, except as regarded field-preaching, were granted. The party which had throughout refused compromise refused it still. In their *Informatory Vindication* they scouted the claim of the sovereign to "indulge" or to "tolerate" an inalienable right, and went on with their field-preaching as though nothing had happened. The death of Renwick, their leader, closes the awful story of the rule of the later Stuarts in Scotland.

Presbyterianism once more supreme.

On 5th November 1688 William landed at Torbay; the bishops' curates were ejected without violence; no retribution was taken, but Presbyterianism quietly reasserted itself as the form of church government natural to the Scottish mind. Presbyterianism, however, was not now what it had been in the days of Andrew Melville or in 1638. The last twenty-six years had thoroughly cowed a great part of the nation, and a new generation had come to manhood who could not even remember the time when Scotland was not Episcopal. The nobles had no interest to serve in re-establishing the old form; the very ministers were those who had conformed or had accepted indulgence. Out of the 400 ejected in 1663 only sixty now survived. Moreover, Scotland had not escaped the wave of latitudinarianism that had come over all forms of Protestant religion. Most of all, the character of William III. and his confidential adviser Carstares affected the nature of the settlement. William was above all a statesman, and a tolerant statesman, and he wished for union of the moderate parties in both kingdoms; on taking the coronation oath he refused to swear the clause binding him to root out heretics and enemies of the true worship of God. The claim of right, too, avoids any assertion of the *jus divinum* of Presbyterianism. But on 22d July 1689 its declaration that prelacy had been an insupportable grievance was made into an Act by the convention of estates, and all Acts in favour of Episcopacy were rescinded. In April 1690 the Act of Supremacy was also rescinded; ministers ejected since 1661 were replaced, and the Presbyterian government of 1592 (thus avoiding all mention of the covenants) restored; lay patronage was abolished, but pecuniary compensation was granted. On 16th October 1690 the first general assembly since 1653 met, when the preliminary act was to receive into the national church the remaining three ministers of the Cameronians (Thomas Lining, Alexander Shields, and William Boyd). Their followers, however, regarded this as a compromise with Satan, and kept themselves aloof.¹ Episcopalian ministers who subscribed the confession and obeyed the Presbyterian government retained their livings, and all sentences of Resolutioners and Protesters against one another were rescinded. Mr Hether-

¹ They remained without a minister until 1707, when they were joined by John M'Millan, minister of the parish of Balmaghie, who had been summarily deposed for principles akin to those of the Society People. The accession of Thomas Nairn, one of the ministers of the Secession Church, made a "Reformed Presbytery" possible in 1743; this became a synod of three presbyteries in 1811. The first "Testimony," published in 1761, was afterwards superseded by that of 1839, which thenceforward was regarded as one of the "subordinate standards" of the Reformed Presbyterian Church. In 1876 before the union with the Free Church (see vol. ix. p. 746) the denomination in Scotland numbered 6 presbyteries, 38 ministers, and 40 congregations. It also had six missionaries in the New Hebrides. For the fortunes of the Reformed presbyteries in Ireland and the United States, see below.

ington well says, "Without a clear conception of this point it is impossible to understand the subsequent history of the Church of Scotland. In consequence of the introduction of the prelatie party the church thenceforward contained within its pale two systems, that of the old and true Presbyterian, subsequently known as the 'evangelical,' and that of the new and semi-prelatie, subsequently known as the 'moderate.' Thenceforward the history of the Church of Scotland is the history of the protracted struggle between these two systems, which were necessarily irreconcilable."

In the first case of friction with the crown, which occurred in 1691, a compromise was effected,—the church successfully asserting its autonomy by granting only part of the privileges which William desired for the Episcopal clergy. The critical dispute occurred when parliament imposed a new oath of allegiance, the taking of which was made a necessary qualification for sitting in the assembly. The church denied the right of the crown to impose a civil oath as a condition of spiritual office; and a serious breach would have occurred but for the efforts of Carstares, who induced the king to give way at the last moment. Having thus asserted her independence, the church conceded to William nearly all he had asked for on behalf of the Episcopalians. In 1696 the parish schools were established. In 1698, to vindicate the church from the charges of backsliding, the general assembly published the *Seasonable Admonition*, which claimed in emphatic language the dependence of the church on Christ alone, and repudiated the doctrine that the inclination of the people was the foundation of Presbyterianism. In 1701 the first condemnation of heresy took place.

The spirit of watchfulness on the part of the church increased during Anne's reign. In naming commissioners for the Union the parliament forbade them to mention the church. The extreme section indeed regarded the Union itself as a violation of the Solemn League and Covenant. The Act of Security provided that the *Confession of Faith* and the Presbyterian government should "continue without any alteration to the people of this land in all succeeding ages," and the first oath taken by the queen at her accession was to preserve it. The Union, however, tended to Anglicize the upper classes and thus to increase the latitudinarianism which was finding its way within the church. Politically speaking, the settlement of the Scottish Church was of great importance to the Government during the Jacobite intrigues, for its attitude was one of vigilance against all that was favourable to Prelacy, and its influence consolidated opinion against the Stuarts.

The High-Church revival of 1710, however, had its effect upon the church. In 1711 an Episcopalian named Greenshields used the English liturgy in Edinburgh. He was condemned by the Court of Session; but the House of Lords reversed the decision and imposed heavy damages on the magistrates who had closed his chapel. In 1712 a Bill of Toleration, which allowed Episcopalian dissenters to use the English liturgy, was hurried through both Houses, in spite of the urgent remonstrances of the Scottish commissioners, and on 22d April lay patronage was restored. This latter Act, as violating the Act of Security, has never been regarded as valid by the severer Presbyterians. That no further resistance was made than by protests and petitions shows how far the "moderatizing" spirit had spread. The remnant of the Cameronians, who were outside of and discouraged by the church, alone met and renewed the Covenant after solemnly acknowledging the sins of the nation.

The progress towards Arminianism, due to the influence of Baxter's writings and to the training of the young ministers in Holland, may be seen in the treatment of Professor Simson and in the Auchterarder case. It was

now that Neonomianism, or the doctrine that the gospel is a new law, promising salvation upon the condition of the abandonment of sin, began. Its first victory was when the general assembly condemned the doctrines of the *Marrow of Modern Divinity*, and rebuked the twelve ministers who had sent in a representation against the decision. The Patronage Act was rapidly being accepted and was showing its effects chiefly in the neglect shown to the wishes of the congregations. In 1731 the right was given to the heritors and elders to "elect and call" instead of to "name and propose the person to the whole congregation to be approved or disapproved," and was made law without having first been submitted to the presbyteries according to the Barrier Act of 1639. This led to the first great schism. Ebenezer Erskine denounced the action of the assembly in two sermons. Being rebuked by the synod of Perth and Stirling, he appealed to the assembly, who approved the rebuke. With three other ministers he protested. The four were temporarily deposed by the assembly, and on 6th December 1733 they formed the "Associate Presbytery." In 1737 their number was largely increased, and they published their manifesto, the "Declaration and Testimony." Their final deposition, and the first schism, occurred on 15th May 1740.

For several years the wishes of congregations were ignored; wherever the presbytery refused to appoint at the will of the assembly, a "riding committee," often assisted by military force, carried out the decision. The civil courts were bound to obey the Act of Patronage, and therefore never upheld the congregation against a legal appointment. At length in 1752 the leader of the "moderate" party, Principal Robertson, seeing in this refusal of presbyteries the elements of endless confusion, and that temporary substitutes, *e.g.*, riding committees, were unconstitutional and bad in principle, determined that the presbyteries themselves should be compelled to carry out the decisions of the assembly. From the deposition of Thomas GILLESPIE (*q.v.*), a member of the presbytery of Dunfermline, who refused to act in accordance with the assembly's decision, is dated the second or "Relief" schism. Principal Tulloch says upon this: "The policy was so far successful; but the success was of that nature which is almost worse than defeat. It introduced order within the church. It crushed the revolt of presbyteries. It silenced in many cases popular clamour. But it quietly and gradually alienated masses of the people from the establishment." So rapidly did dissent spread that from a report presented to the general assembly in 1765 it appears that "there are now 120 meeting-houses erected, to which more than 100,000 persons resort, who were formerly of our communion, but have separated themselves from the Church of Scotland. This secession," the report adds, "is most extensive in the greatest and most populous towns." For the subsequent history of Presbyterianism in Scotland, see FREE CHURCH, UNITED PRESBYTERIAN CHURCH, and SCOTLAND (CHURCH OF).¹

England.—Several faint traces may be noted of the presence of Presbyterian ideas in England within a few years of the Reformation. During the reign of Edward

VI., for instance, Bucer, with Cranmer's goodwill, laid before the king a sketch of church discipline and reform of episcopal government. Each bishop was to have a council of presbyters, and provincial synods with a royal commissioner were to meet twice a year. Many English joined Lasky's foreign church, and when it was dispersed under Mary settled chiefly in Frankfort, where the dispute took place in which the adherents of the Prayer Book defeated Knox and his followers. These came to England filled with Calvinistic views regarding church and state, only to find the royal supremacy absolute, and uniformity enforced under crushing penalties. Even the foreign Protestants were compelled to choose the bishop of the diocese as their superintendent. The contest, which began after a scheme of reform had been lost in convocation by *one* vote in 1562, was ostensibly concerning vestments and ceremonies; really it rested on a far wider basis, one which found place even in Cambridge disputations, *viz.*, "whether the civil magistrate has authority in ecclesiastical affairs." That the Puritans² did not look for a speedy setting up of "discipline" may be seen in Cox's letter to Gualter, "We have some discipline among us with relation to men's lives, such as it is; but if any man would go about to persuade our nobility to submit their necks to that yoke, he may as well venture to pull the hair out of a lion's beard." In 1566 took place the first separation of several deprived London ministers, who determined in future to use the Geneva service book, which they did until they were arrested in Plumbers' Hall on 19th June 1567. During 1567 and 1568 the persecutions in France and Holland drove thousands of Protestants, chiefly Presbyterians, to England. In 1570 the leading Presbyterian views found an exponent in Thomas Cartwright at Cambridge (the headquarters of advanced Puritanism); and the temper of parliament is shown by the Act of 1571 for the reformation of disorder in the church, in which, while all mention of discipline is omitted, the doctrinal Articles alone being sanctioned, ordination by presbyters without a bishop is implicitly recognized. It is to be observed that Cartwright and the leading Puritan theologians opposed the idea of separation. The voluntary association of bishop, ministers, and laity at Northampton is interesting as showing how earnest men were thinking. Their discipline was strict and their tone with regard to the state and to the existing constitution of the church was too bold to allow of indulgence. In spite, however, of constant deprivation, especially in the midland and eastern counties, the obnoxious doctrines spread; and in 1572 the first formal manifesto was put forth in the *Admonition to Parliament* of Field and Wilcox, with the assent of others. Equality of ministers, choosing of elders and deacons, election of ministers by the congregation, objection to prescribed prayer and antiphonal chanting, the view that preaching is a minister's chief duty and that the magistrate should root out superstition and idolatry, are leading points. The controversy which followed between Whitgift and Cartwright showed how impossible agreement was when the one side argued that the Holy Scriptures were the only standard as well for church government as of faith, and the other that a system of church government was nowhere laid down in Scripture, and might be settled by and accommodated to the civil government under which men happen to be living. On 20th November 1572 the authors of the *Admonition* set up at Wandsworth what has been called the first presbytery in England. They chose eleven elders and put out

² We use this word in its widest sense to include all who desired purity in church government and doctrine. They consisted at first of the returned exiles of the Marian persecution, and separated under the stress of Elizabeth's action into Independents and Presbyterians, the latter remaining inside the church.

a purely Presbyterian system, the *Orders of Wandsworth*. Similar associations were erected in London and in the midland and eastern counties. When, however, an attempt was made to join the foreign churches in London, the privy council forbade it. Jersey and Guernsey, whither large numbers of Huguenots had fled after the massacre of St. Bartholomew's, alone were Presbyterian by permission. Cartwright and Snape were pastors there, and from 1576 to 1625 a completely appointed Presbyterian church existed, confirmed by synods (held at Guernsey and Jersey on 28th June 1576 and 17th October 1577) and authorized by the governor. Meantime Cartwright and Travers had drawn up a scheme, never realized, by which ministers were bound to refuse ordination by a bishop unless they had previously been "called" by a congregation and approved by a church classis. Ceremonies in dispute might be omitted; should this cause danger of deprivation the classis was to decide. The doctrinal Articles might be subscribed, but not the Prayer Book. Churchwardens might easily be converted into elders and deacons; and classical, comital, and provincial assemblies were to be held.

Presbyterianism
in
England.

The suppression of independent life in the church at length drove numbers out, known in the future as Brownists or INDEPENDENTS (*q.v.*). Those who remained still strove for reform. They were met by a new court of high commission and the "ex officio" oath,—an increase of severity strongly opposed by Burghley and the privy council. These views are expressed in Travers's *Disciplina Ecclesie ex verbo Dei descripta*, printed at Geneva in 1574, translated with additions by Cartwright in 1584, then suppressed and not again published until 1644, when it was officially recognized as the *Directory of Government*.¹ Its leading principles were those of French Protestantism. It was signed by some 500 ministers, Cartwright among them. The action of the Commons in 1584, stimulated by the opposition of the Lords, shows that the principles of Presbyterianism were very strong in the country. Bills were introduced to limit the stringency of subscription, and to confine the penalties of suspension and deprivation to cases of heresy or scandalous life, to reduce the position of a bishop wellnigh to that of merely *primus inter pares*, for placing the power of veto in the congregation, for abolishing the canon law and all spiritual courts, and for establishing a presbytery in every parish. All these proposals were, however, cut short by the unflinching exercise of the queen's prerogative; and, with some slackening during the great year of peril, the Puritans suffered extreme persecution. In 1588 they held a provincial synod at Warwick, and also again at Michaelmas. It is noticeable, as showing the growth side by side with Presbyterianism of the spirit directly its opposite, that on 12th January 1588 Bancroft for the first time maintained the *jus divinum* of Episcopacy.

There seems no doubt that during the later years of Elizabeth Presbyterianism declined. The position of the conforming Puritan was in every way a weak one. He had sworn to the queen's ecclesiastical supremacy, and this supremacy was what he most hated; he was compelled to have recourse to the figment that, although she had this supremacy, she could not exercise it ecclesiastically, but could merely give her sanction to whatever was enacted by the church. On the other hand, in appearing to attack the church he appeared to attack the nationality of the country when the national spirit was most intense. The nation was rapidly becoming conscious of a vivid and energetic national life, and whatever impaired the national unity was regarded with impatience and resentment at a

time when the political condition of Europe was fraught with such danger to England herself. The Scottish Presbyterian had triumphed over a hated and alien church, and the bishops whom he overthrew were evil-living and oppressive men; the English Presbyterian knew that his church was the symbol of freedom and that her bishops had been holy men martyred for the sake of that freedom. Finally, in England there had existed among the common people, as there had not in Scotland, an absence of interference and an independence of private life which would naturally form the strongest obstacle to the introduction of the longed-for Presbyterian discipline. The difference between English and Scottish Presbyterianism was clear to James when in the millenary petition the reforming clergy disclaimed all idea of affecting parity in the church or of attacking the royal supremacy, and merely requested the redress of certain abuses in rites and ceremonies. Even with regard to the "ex officio" oath they asked only that it might be more sparingly used. The Puritans had evidently lost faith in themselves and had been unable to spread their views. "Elizabeth had drained the life out of Puritanism by destroying the Armada and by her subsequent policy in taking the leadership of the Protestant interest in Europe." It needed the abuses of the reign of James I. to restore it. The king was still further encouraged by the servile support of the universities, which had quite lost their Puritan tone. At the Hampton Court Conference in January 1604, Dr Reynolds as spokesman of the Puritans desired permission for clerical assemblies every three weeks, "prophesyings" in rural deaneries, and that appeals might lie from the archdeacon's invitation to the diocesan synod, composed of the bishop and his presbyters. The coarse and menacing rejection of these demands made clear the weakness of the reforming party within the church as opposed to the cordial alliance between the High Church and the crown. The breach was wider than at any time under Elizabeth. The struggle was becoming political. Divine right of Episcopacy, Arminianism, and prerogative in the crown were becoming ranged against Presbyterianism in church government, Calvinism in creed, and moderate republicanism in politics.

In 1604 James put out the *Book of Canons*, by which every clergyman was forced to subscribe, "willingly and ex animo," (1) the spiritual and ecclesiastical supremacy of the crown, (2) the Book of Common Prayer, (3) the Thirty-nine Articles of 1562, as being all and every one of them agreeable to the word of God. The *Book* was passed under the great seal, but was never ratified by parliament. As the result, a large number of ministers, variously reckoned at from 45 to 300, were deprived of their benefices. Henceforward the persecution was steady and grievous, and an exodus took place to Holland, where the exiles erected Presbyterian churches which in their turn reacted continually upon opinion in England. By far the larger part of the Puritans, however, clung to the church. As late as 1607 they eagerly expressed their desire "above all earthly things" to continue their ministry "as that without which our whole life would be wearisome and bitter to us." And in 1605, in answer to the attacks from both the extreme parties, William Bradshaw published his *English Puritanism*. The system herein developed, so far from being Presbyterian, is Congregationalism under state control. While each congregation is to be entirely independent of all other ecclesiastical courts, the election of its officers and other important matters are ostentatiously given to the civil magistrate. Not the slightest intrusion by ecclesiastical officers upon civil authority may be allowed; and all church preferment is absolutely in the hands of the crown, which is supreme over the constitution and proceedings of synods, and whose commands may not be

¹ M'Crie, *Annals of Presbytery*, says that the *Orders of Wandsworth* were the *Directory*.

actively resisted. The king himself is subject to his own particular church alone, and even though apostate or an evil liver he retains his full supremacy. It is clear that the denial, in the Scottish sense, of the state supremacy is not expressed by the English Puritan: that which galled him was the jurisdiction of other ecclesiastics.

From the synod of Dort in 1618 Arminianism gained ground in England in spite of the fact that Abbot, the primate, was head of the "doctrinal" (or old Calvinist) Puritans. As soon as Laud came into power the Government attacked Presbyterianism wherever it was found. Guernsey was compelled to accept Episcopacy, as Jersey had been in 1605, and the ten foreign congregations in England were placed under the control of the English Church. The English congregations in Hamburg and the Netherlands were also ordered to relinquish their synods. The system of the church was aristocratic exclusiveness.

One effect of the Scottish outburst in 1638 and of the events which followed was of course largely to strengthen in especial the Presbyterian interest. The action of the church tended constantly to cut off waverers. Baxter, for instance, was led to examine and finally to throw off Episcopacy by the "et cætera" oath in 1640. Nevertheless at the opening of the Civil Wars, if he is to be believed, Nonconformity, and in especial Presbyterianism, was very weak. "Where I was bred before 1640, which was in divers places, I knew not one Presbyterian clergyman or layman. . . . About as many Nonconformists as counties were left, and those few stuck most at subscription and ceremonies, and but few of them studied or understood the Presbyterian or Independent disciplinary causes." Those who sat in the Westminster Assembly were almost all such as had conformed.

In 1640 Henderson, Baillie, Blair, and Gillespie came with the Scottish commission to London, the ministers there having written to the general assembly expressing their desire for the establishment of the Scottish system. They at once set themselves to turn the current of Puritanism into the Presbyterian channel, and to bring about a union on the Presbyterian basis. Their preaching attracted large crowds, and, by a common mistake, they judged of all England from the London ministry, which was largely Presbyterian and which in December 1641 had petitioned for a synod (a desire expressed also in the Grand Remonstrance) to include ministers from foreign parts. The parties, however, which were to join issue at the assembly were already clearly recognizing one another, for we hear that "the separatists are like to be of some help to hold up the bishops through their impertinence." For the views of moderate men on church reform the speeches of Sir E. Deering are important. It is clear that had the bishops been willing to become the allies of a reforming parliament Presbyterianism would not have been seriously discussed.

In September 1642 the Long Parliament abolished Episcopacy, the abolition to date from the 5th November 1643; the question what form of Puritanism should succeed it was that for which the Westminster Assembly was summoned by parliament on 12th June 1643. The intervening months were marked by a great increase of sects, of whom all were by nature opposed to the iron domination of Presbyterianism, which in its turn found support in the English ministers of Dutch congregations. It is important at the outset to notice that the assembly was born in Erastianism, the spirit which, from the whole course of English history for several centuries, may be regarded as national. It was a mere council of advice to the parliament of England, a creature of the parliament alone. Its members, two from each county, though some counties had but one, were chosen by parliament, and "nearer agreement with the Church of Scotland" is one of the

chief points in the ordinance. In 1643 also the Long Parliament, needing Scottish support, and willing to bid high, formed the Solemn League and Covenant. In this the English, struggling for civil liberty, cared only for a political league; moreover, "they were," says Baillie, "more nor we could consent to, for keeping of a doore open in England to Independencie. Against this we were peremptorie." To the Scots "its chief aim was the propagation of our church discipline to England and Ireland." The title was a compromise, utterly distasteful to the Scots, who refused to call it anything but the "Covenant."

The number summoned to the assembly was 151, 10 being lords, 20 members of the House of Commons, 121 ministers. About one-half attended regularly. Besides the Episcopalian clergy, who did not attend, there were four parties—(1) moderate Reformers of Presbyterian temper, (2) Presbyterians of Scottish views, (3) Erastians, and (4) Independents. At the request of the parliament six Scottish commissioners, without a vote, of whom five (the sixth was Maitland, afterwards the celebrated duke of Lauderdale) were informed with the intensest spirit of Scottish Presbyterianism, attended the assembly. To them their mission was a holy one, being no less than "to establish a new platform of worship and discipline for this people for all time to come." That this was to be Presbyterian was the one thought that possessed their minds,—at first with eager hope, changing to apprehension and then to disappointment so bitter that it broke the heart of Alexander Henderson and made Baillie bewail the distance of the Scotch army. They struggled with pathetic earnestness against influences whose strength they had not realized,—the hated sentiment of Erastianism and the still more hated sentiment of Independency. The first of these was chiefly in the background in parliament, where it did not express itself fully until late in the proceedings; within the assembly it was consummately represented by Lightfoot, Coleman, and Selden, who held that "parliament is the church." The Independents, numbering only ten or eleven in all, their principal representative being Nye, were also men of great ability and clear views, who knew that they could depend on the support of the party led by Cromwell.

The assembly began in September by considering what to substitute for the Thirty-nine Articles. On 12th October, however, in deference to Scottish pressure, the parliament instructed them to take up at once the questions of church government and a liturgy. Church officers were first discussed. The Independents disputed every inch of ground: "to the uttermost of their power they have studied procrastination of all things, finding that by tyme they have gained." The long discussion which they forced on the question of the identity of pastor and doctor (in which, holding the offices to be distinct, and that every congregation ought to have both, they were opposed both by the Scots on the latter and by the Anglicans on the former ground) was but one example of their skill in obstruction. The grand battle, however, began on 22d November over the ruling eldership—the essence of the "Scots' discipline,"—against which Independents and Erastians alike did their best. All were willing to admit elders "in a prudential way," i.e., as *expedient*, but "sundry of the ablest were flat against the institution of any such offices by divine right," and the Independents kept them "in a pitiful labyrinth these twelve days." In the end a compromise was effected, grievous to the Scots, by which it was merely declared "agreeable to, and warranted by, the word of God, that some others besides the ministers of the word should join in the government of the church." An attempt further to define their office failed. By the end of the year the Scots became anxious: "as yet a presbyterie to this people is conceived to be a strange

monster." In a minor point they had experienced a rebuff. They had done, as true Presbyterians, all they could to induce the assembly to sit on Christmas Day, church festivals being to them an abomination; but they only prevailed so far "that both houses [of Parliament] did profane that holy day, by sitting on it, to our joy and some of the assembly's shame." The observance of saints' days and holidays was not abolished until 8th June 1647.

On 9th January 1644 the pressing question of ordination was brought forward. The committee reported that preaching presbyters should alone ordain. To this the Independents of course objected and kept the assembly in debate until 21st January. The House of Lords pressing for a settlement, it was next day proposed that "certain ministers of the city be desired to ordain ministers in the city and vicinity *jure fraternitatis*." On this and on the essential question, how far the consent of the congregation should be necessary, the Independents kept up the struggle until 19th April, when the latter point was determined in the non-intrusionist sense. The bitterness of the Scots against the Independents increased daily; they were fairly puzzled at the want of enthusiasm for that which was the breath of their lives. "This stupid and secure people, . . . this fainting and weak-hearted people," Baillie calls them, and adds, "the humour of this people is very various, and inclinable to singularities, to differ from all the world and from one another, and shortly from themselves." No people, he says, had so much need of a presbytery. The hatred was fully returned. An intrigue¹ was set on foot for a union between the Independents and the moderate royalists to keep out Scots and Presbyterianism on the basis of the restoration of Charles. So anxious did this render the Presbyterians that they offered to make a compromise whereby to strengthen their cause in parliament; and, probably at the suggestion of their chiefs there, the five leading Independents published (February 1644) their *Apologetical Narrative*, which traversed their whole controversy with the Presbyterians and was addressed, not to the assembly, but to the parliament. This manifesto, as well as the *Antapologia* and other answers from the Presbyterians, is well analysed by Hetherington. From the moment of this publication there was no longer any object in delaying the main battle. "The Independents are resolute to give in their reasons to parliament against us, and that shall be the beginning of an open schism: lykeli we shall be forced to deal with them as open enemies." On 6th February it was proposed that "the Scripture holdeth forth that many particular congregations may be under one Presbyterian government." After six weeks' incessant debate, in which both Erastians and Independents used their utmost ability, and in which Nye ostentatiously and successfully appealed to the jealousy of the *imperium in imperio*, they were forced to yield. In this discussion the English Presbyterians were less disposed to compromise than the Scottish, who were keenly anxious for the success of their mission. The ruling eldership was then voted, and "on Fryday, after a week's debate, we carried, albeit hardlie (27 to 19), that no single congregation has the power of ordination." On 31st May Baillie adds, "our church sessions, to which the Independents gave all, and their opposite nothing at all, we have gotten settled with unanimity in the Scots' fashion." The Presbyterians were, however, by no means easy; they felt their triumph to be yet but a barren one. "The chief point we wish were proven is the real authority, power, and jurisdiction of synods and classical presbyteries over any the members of the whole of a particular congregation; also I wish that the power of presbyteries classical to ordaine and excom-

municate were cleared. Many beside the Independents are brought to give the rights of both these actions to the congregational presbyteries, much against our mind and practice." The great question, the power of parliament in ecclesiastical affairs, was yet unsettled; and here they looked anxiously at "Selden and others, who will have no discipline at all in any church *jure divino*, but settled only on the free will and pleasure of the Parliament," and they had forebodings that "Erastus' way will triumph." Their fears were soon realized. On 15th November 1644 the assembly reported to parliament all that had been done, Parliament and the House at once debated the *jus divinum* question, mentary action. Glynn and Whitelocke spoke vehemently and at great length, and then upon the question it was carried to lay aside the point of *jus divinum*, and the House gave them thanks for preventing a surprise. It was resolved, however, that the Presbyterian government should be established, and that if upon trial it was not found acceptable it should be reversed or amended.

Cromwell, who had shortly before "expressed himself with contempt of the assembly of divines," terming them "persecutors" and saying that "they persecuted honest men than themselves," and who had told Manchester that "in the way they [Scots] now carried themselves he could as soone draw his sword against them as against any in the king's army," came to the rescue of the Independents in the assembly by procuring on 13th September an order from the parliament to refer to a committee of both kingdoms the accommodation or toleration of the Independents. This committee, lasting until 15th October, was no doubt intended to gain time, for time was against the Scots, and it did nothing else. The Independents then, with written reasons against the propositions respecting church government, with objections on the question of excommunication, with their "model" and their remonstrances, managed to protract discussion until March 1646, and in the end to leave matters unsettled and without prospect of settlement. In January 1645 the abortive negotiations at Uxbridge took place, at which each party asserted the *jus divinum*. The conditions proposed to the king had been drawn up by Johnston of Warriston and approved by the Scottish parliament; they included the acceptance of the Covenant. In the compromise offered by the king he assented to the limitation of the bishops' power by a council of the lower clergy, and even by laymen to be elected by this council, in each diocese.

In April (Self-Denying Ordinance) and again in October 1645 (the battle of Naseby having been fought in June) the parliament passed a vote which was gall and wormwood to the Scots, for it provided a power of appeal from the national assembly to the parliament. It also insisted that there should be two ruling elders for each minister in a church meeting, and allowed censures to be passed only in cases which it enumerated. No way remained to stay the mischief, Baillie felt, except by "hastening up our army, well recruited and disciplined." On 20th February 1646 they resolved that a choice of elders should be made throughout the kingdom; but on 14th March Baillie himself bewails that "the House of Commons has gone on to vote (by a majority of one) a committee in every shire to cognosce on sundry ecclesiastical causes, which will spoil all our church government." The fact was that, the king² being now very weak, Scottish friendship was daily growing of less importance. When the commissioners from the Scottish parliament urged the speedy erecting of presbyteries, the English expressed their dread of "granting an

¹ For the first time investigated and brought to light by Professor S. R. Gardiner (*Camden Miscellany*, 1883).

² At Newcastle in November 1646 the king offered to sanction the Presbyterian establishment, with all its forms and the order of public worship already adopted, for a period of three years, without prejudice to his own personal liberty.

arbitrary and unlimited power to near 10,000 judicatories within this kingdom," and declared that, experience having shown that the parliament had preserved the Reformation and purity of religion, they had no reason "to part with this power out of the hand of the civil magistrate." On 30th April 1646 the House proposed queries which practically challenged the *jus divinum* position from one end to the other. The assembly at once set themselves to answer these captious questions; but of questions and answers the parliament took care that for the present no more should be heard. When, however, on 1st December 1646 the London ministers published their manifesto *Jus divinum regiminis ecclesiastici*, the House of Commons called for the assembly's answers, which do not appear to have been forthcoming. Throughout the contest the Scottish commissioners, especially Baillie, organized the opposition, immortalized in Milton's sonnet, of the London ministers against the parliament's action. The king, however, having fled in April to the Scots, parliament thought it needful to temporize. On 5th June, therefore, both Houses ratified the ordinance establishing presbyteries; on the 9th they ordered it at once to be put into execution; and—a still more significant step—they rescinded the clause for provincial committees which had given Baillie such vexation. The order, however, remained a dead letter until 22d April 1647. Twelve presbyteries were then erected for London; Lancashire and Shropshire were organized, and Bolton was so vigorous in the cause as to gain the name of the Geneva of Lancashire; but the system spread no farther in the ungenial soil and air of England. Even here the difference between Scottish and English Presbyterianism is shown by the fact that two-thirds of every classis or presbytery were necessarily laymen. The first meeting of the London synod was on 3d May 1647, and it met half-yearly until 1655. That of Lancashire met at Preston in February 1648. After all, however, it appeared that the votes of the Houses were permissive only; for on 13th October 1647 the Lords voted to ask the king for his sanction to the proviso that "no person shall be liable to any question or penalty only for Non-Conformity to the said government or to the form of the divine services appointed in the ordinances," while such as would not conform were to be allowed to meet for religious exercise in a fit place so long as the peace was not disturbed.¹ The language of the Commons was almost equally indulgent, while on 1st November the "agitators" declared that "matters of religion and the ways of God's worship are not at all entrusted by us to any human power." Presbyterianism was wellnigh as far from being established at the close of the assembly as in the days of Elizabeth. English Protestantism had been a protest, not against Roman Catholicism, but against papal supremacy; the country was as little disposed to accept Presbyterian supremacy. The reader will gain some idea of the particular forms of tyranny which England had declined in "The Harmonious Consent of the ministers of the province within the County Palatine of Lancaster, &c." (Halley, *Lancashire, its Nonconf.*, p. 467). In May 1648 the parliament, now that army pressure was removed, passed the celebrated "ordinance against blasphemy and heresy." If ordinances could have fought against the inherited instincts of centuries Presbyterian government would have run riot. On 29th August it was again decreed that "all parishes and places whatsoever within England and Wales shall be under the government of congregational, classical,

provincial or national assemblies," except royal chapels and peers' houses. In October 1648 Charles at Newport offered to accept Ussher's scheme,² and, in answer to an address from London, consented to a temporary alienation of church property for the maintenance of Presbyterian ministers. In November, however, the army asserted itself; it afterwards purged the parliament when it found that there was an accommodation between Charles and the Presbyterians, and killed the king. With the foundation of the Commonwealth the dream of Presbyterian supremacy passed away. The Presbyterians are henceforth to be regarded as a political far more than as a religious body. They now formed the nucleus of that party which desired the restoration of monarchy on good conditions. Opposing the toleration granted to all forms of Protestantism by Cromwell, they became his most dangerous opponents by their sympathy with the Scots and their refusal to take the "engagement," as is illustrated by the plot for which Love was executed. The parliament meanwhile secured them in their livings. As Cromwell said to the Scots, "The ministers in England are supported and have liberty to preach the Gospel, though not to rail at their superiors at discretion, nor under a pretended privilege of character to overtop the civil powers." In the Instrument of Government (1653) Cromwell expressly retained all the laws in their favour and appointed some of them on the list of triers. They had their classical presbyteries for ordination, but these, having no coercive power, gradually became merely meetings of ministers of all denominations. The position of Baxter and his followers is worthy of notice, and should be read in his own words (Orme's *Baxter*, vol. i. p. 92). Nominally a Presbyterian, he disliked the lay eldership; he disliked their intolerance; he disliked the subordinate position ascribed to the civil magistrate; in his own terse language, "Till magistrates keep the sword themselves, and learn to deny it to every angry clergyman who would do his own work by it, . . . the church will never have unity and peace." On the question of the independence of congregations he was an Independent in sympathy and practice. His absorbing idea was union; with Ussher, he says, he had agreed in half an hour; among rigidly defined parties it is not possible to find him a place; but in the light of that idea he appears perfectly consistent. John Owen was another man who illustrates the light and shade of English opinion. He opposed the London ministers, though he held a Presbyterian appointment. In 1644 he upheld Presbyterianism against Independency; in 1646 he became formally connected with the Independents. The Presbyterian was above all, on the political side, a hater of the army and a parliamentarian, and therefore, especially after Richard Cromwell's resignation, a monarchist. Monarchy and parliaments were co-ordinated in the English mind. Baxter preaching before the Commons on 30th April 1660 said, "Whether we should be loyal to our king is none of our differences. . . . For the concord now wished in matters of religion it is easy for moderate men to come to a fair agreement." To take advantage of this feeling Charles II. used all the resources of duplicity; the deputation of divines was easily and entirely tricked, and on his entry into London the Presbyterian ministers received him with acclamation. Until the actual Restoration the ascendancy of Presbyterianism,

Under
Charles
II.

¹ In December 1647 Charles, at Carisbrooke, again agreed with the commissioners from the Scottish Kirk to the conditions formerly offered at Newcastle, in consideration of their promise to take up arms for his cause. The establishment of Presbyterianism, the extirpation of sectaries, and covenant uniformity were demanded by the English.

² Ussher's scheme suggested (a) three synods, namely, one of the clergy of the rural deanery, meeting once a month; one of the clergy of the whole diocese, meeting once or twice a year; and representatives of the clergy of the province, meeting once in three years, the archbishop presiding; (b) if parliament were sitting, the two provincial synods were to unite, and the whole government of the church was to be in their hands. There was no representative of the laity in the scheme.

subsequent to Monk's entry into London, had seemed complete. The council was almost exclusively Presbyterian; Presbyterians commanded the garrison towns and the fleet, and had possession of the universities. The last acts of the Long Parliament had been to establish Presbyterianism as the religion of the state. It was therefore necessary on the part of Charles and Clarendon to temporize. Promises were made from Breda; hopes of comprehension and preferment were placed before the Presbyterian ministers; conferences were arranged between them and the leading Episcopal clergy. There is no sign, however, that the most ardent Presbyterian hoped for more than Ussher's model. They were sufficiently bound over by the Covenant, the oath of allegiance, the traditional connexion of parliament and monarchy, and, above all, by their jealousy of the Scots, to restore the king.

The solemn farce began. Ten ministers were made royal chaplains, and Charles II. expressed his intention of doing his best to heal the differences in religion. He wished to know their desires. They asked for a resident ministry, Sunday observance, Ussher's model, the revision of the Prayer Book, extemporary prayer, that kneeling at communion and the observance of saints' days might not be enforced, and that bowing at the name of Jesus, making the sign of the cross in baptism, and the use of the surplice might be abolished. Baxter also suggested that the suffragan bishop should be elected by the clergy of the rural deanery. The bishops replied in writing, refusing all concession, except, perhaps, as regarded the cross, bowing, and the surplice, and taunting their opponents with "scruple-mongering." Charles now put out his declaration, which included a proviso that the presbyters' advice and assistance should be necessary to certain episcopal functions, and especially to church censures. This, and the Bill to turn it into a law, kept the Presbyterians in play; by Clarendon's influence the Bill was thrown out on the second reading, and the convention parliament was dissolved. The parliament which followed was Episcopalian. The church at once struck hard. The Corporation Act, 20th December 1661, destroyed Presbyterian influence in the large towns, the centres of its power; the Act of Uniformity, 19th May 1662, compelling "assent and consent" to everything in the Book of Common Prayer, destroyed it in the church. Under circumstances of open deceit and flippant cruelty 2000 ministers were, on St Bartholomew's Day, deprived of their offices. It is important to notice that the Papists and other Dissenting bodies opposed toleration to the Presbyterians; they felt that the only chance of a general toleration was in the failure of the Presbyterians to obtain comprehension.

Between these two Acts the Savoy Conference had been held, beginning 25th March 1662; it met apparently to signalize the church's triumph. It was intended to fail, as the Hampton Court Conference had been intended to fail, and is of interest merely as being the last attempt at union by conference.

With regard to toleration Charles II. and James II. were Bourbons, and they wished to carry out the policy of their ancestor, Henry IV. of France. They hoped to use the gratitude and dependence of the sects whereby to sustain them against the church. Cromwell had done the same; toleration and military despotism had been parallel ideas. Charles desired that the church should *not* tolerate, but that he should. Thus he hoped to have a despotism founded upon the support of the sects. The greater part of his reign presents a constant struggle of the church and parliament to frustrate his views. To gain the power of suspending the penal laws was the great object in the comprehension scheme of 26th December 1662. In an instant church opposition began; the primate and the parliament

spoke with equal sternness, and the suggestion was dropped. As had happened in Scotland, the ejection of St Bartholomew's Day had led to conventicles; the first Conventicle Act, 16th May 1664, was an expression of the hatred of the Anglican Church to Charles's scheme.

In 1665 the plague occurred; the pulpits of London were deserted by the Episcopal clergy, with a few brilliant exceptions. The Presbyterians and Independents came forward to fill them. The jealousy of the church was aroused, and at its demand, and in return for a supply for the Dutch War, Charles passed the Five Mile Act.¹ The extent to which these successive acts of persecution affected the country varied greatly. In some parts the justices refused to convict, or were languid. Thus Seth Ward, in one of his reports to Sheldon from Exeter (in 1663), says, "Your Grace shall know that there are, in this county of Devon onely, . . . at least fourteen Justices of the peace who are accounted arrant Presbyterians." The bishop of Chester makes the same complaint in 1667.² With the fall of Clarendon the idea of toleration at once revived. In February 1667 Charles recommended it to parliament and relaxed the penal laws. But the idea had taken possession of the English mind that what Charles wanted to tolerate was Popery; wherever Charles wrote "dissent" the English mind read "pope of Rome." Some questions drawn out by Sheldon against toleration may be seen in the Sheldon MSS., and are worth reading. It was this fear, and the belief that the integrity of the Church of England was the great safeguard against Popery, that had to answer for much of the persecution. By 176 votes against 70 parliament voted against comprehension, and by 144 against 78 for the continuance of the Conventicle Act, while on 2d March 1670 a second Conventicle Act of special severity was forced from Charles.

On 15th March 1672 the king made another attempt by his famous Declaration of Indulgence, in which he boldly claimed the suspensory power. This caused great searchings of heart among the Dissenters, for they must either refuse the indulgence or uphold an unconstitutional proceeding. Ought they to accept anything short of comprehension? Their doubts were cut short by the withdrawal of the Indulgence only three months after its utterance, and the Test Act signalized the victory of the church. The church became more and more exclusive; the parliament, drawing its life from the people, gradually changed its tone. In 1663 the Anglican Church wished to triumph over Dissent; in 1673 Protestants wished only to secure themselves against Popery. The Commons therefore passed a Bill for the ease of Dissenters, which was, however, dropped in the Lords.

No further change occurred in the legal status of the Presbyterians. Their party continually increased in influence under Shaftesbury's guidance, and in 1680 the Commons agreed to a scheme of comprehension for all Dissenters who would subscribe the doctrinal Articles; the surplice was to be omitted except in cathedrals or royal chapels; and ceremonies were to be regarded as indifferent. This attempt at union came to nothing, however, through church opposition, as did a final attempt at toleration by Charles in 1684. Throughout his reign the church had held him in a never-relaxing grasp. The intervening years were a period of constant annoyance to the Presbyterians, who were discredited by the Rye

¹ By this Act all who refused to declare that they "would not at any time endeavour any alteration in church or state" were made incapable of teaching in schools, and prohibited from coming within 5 miles of any city, corporate town, or parliamentary borough, or within 5 miles of any parish, town, or place, where they had since the Act of Oblivion been parson, vicar, or lecturer, or where they had preached in any conventicle, on any pretence whatever.

² Sheldon MSS., Bodleian Library.

House Plot. Such were the relations of the Presbyterians to the church. Their relations to the Independents were the old ones of jealousy and hostility. They themselves always looked for a position in the establishment; the principles of the Independents excluded the idea. Attempts at union occurred, but they were useless.

Merged

sent
gener-
ally.

From this time the history of the Presbyterians is lost in that of Dissent generally. James refused to enforce the penal laws; but they enforced themselves, and Baxter was one of the first to suffer. Monmouth's attempt only increased their sufferings. In 1687 their prospects brightened. James II., following his brother's policy, issued his Declaration for Liberty of Conscience, as he had already done in Scotland and Ireland. The motive, as Hallam says, was that already mentioned, "to enlist under the standard of arbitrary power those who had been its most intrepid and steadiest adversaries." In the addresses of thanks sent up the leading Dissenters (except the Quakers) refused to join; indeed, at a general meeting of ministers a resolution was passed directly condemning the dispensing power. The action of James, by which the work of the Corporation Act was in a great measure undone and the power in corporations once more thrown into Dissenting hands, was equally unsuccessful. Throughout his reign the king failed to comprehend that the Dissenters were, first of all, Protestants. William III.'s declaration from Torbay recommended comprehension, and in March 1689 he urged it upon parliament. A Bill was brought into the Lords for abrogating the oaths of allegiance and supremacy, and for abolishing the Test Act so far as Dissent was concerned. The High-Church party, however, was strong enough to secure its failure. Another Bill with the same intent, as well as attempts to relieve the Dissenters of kneeling at the sacrament and using the cross in baptism, and to explain away "assent and consent," as required by the Act of Uniformity, was also jealously and successfully opposed. By the Act of Toleration, however, all the penal laws, except the Corporation and Test Acts and those against the deniers of the Trinity, were removed. But it did not abrogate the statutes of Elizabeth and James I., which exacted certain penalties on such as absented themselves from the parish church. Heresy, too, was still subject to the church courts. A last attempt was made, by an ecclesiastical commission of thirty divines, to frame a scheme of comprehension. It was vehemently opposed in convocation; the High Churchmen withdrew from it; and it was never submitted to parliament. Thus ended the last of the fruitless attempts to comprehend Dissent within the establishment. During William's reign the hatred of the church to the Presbyterians had been obliged to lie dormant. Anne's accession, however, led at once to an attempt on the part of the churchmen to revenge themselves by the introduction of the Occasional Conformity Bill for the toleration which they had been compelled to practise. This, however, they were unable to carry through against the opposition, of which Burnet was the foremost champion.

Having secured toleration, the Dissenters began to think of their own internal condition. A coalition of Presbyterians and Independents was thought desirable. The mere mention of such a thing shows how profoundly the complexion of affairs had changed. Under the name of "United Brethren" about eighty ministers of London met and drew up heads of an agreement, in nine articles, on church government and ecclesiastical discipline. Article 8 provided that the union should not discuss doctrine, and named as auxiliaries to Scripture the Articles, the Savoy Confession, and the Westminster Catechism. Mutual concessions were now made. The Independents gave up the necessity of the consent of a church to the ordination of a minister, and only made it desirable; and the office of

doctor, as distinct from pastor and ruling elder, was passed over. But the Presbyterians gave up far more, viz., the authoritative power of synods over individual churches. In other words, the Presbyterians gave up and the Independents retained each the kernel of their system. Excommunication was emasculated. The prerogative of synods was reduced to occasional meetings and a reverential regard for their judgment. But this arrangement only affected London and its neighbourhood. Moreover, while their views of church government were so profoundly modified in the Independent direction, a change equally noticeable took place in their doctrinal views. From the beginning of the 18th century the greater number of their congregations became Unitarian, while those which remained orthodox joined themselves to the Scottish Church. The fact that at a time when full toleration was enjoyed the Presbyterian principle ever grew weaker shows how little it had penetrated into the English mind. During the present century a new establishment of Presbyterian congregations has taken place upon the Scottish models, and indeed at first as an offset of the Scottish Church itself. In May 1836, however, the synod of the Presbyterian Church of England was established, in entire independence of, though in friendly union with, the Scottish Church, containing at the present time (1885) 10 presbyteries with 280 congregations.¹

Modern
doctrinal
tendencies.

Ireland.—Presbyterianism in Ireland dates from the Ireland. plantation of Ulster, by which a large part of Ireland ceased to be Papist and was peopled afresh by Scotsmen and Englishmen. An independent Protestant church was settled in James I.'s reign, and at the convocation of 1615 the first confession of faith was drawn up by James Ussher, which implicitly admitted the validity of Presbyterian ordination and denied the distinction between bishop and presbyter. It was not, however, until 1626 that the beginning of the Presbyterian system was laid by Hugh Campbell, a Scot, who, having become converted, "invited some of his honest neighbours . . . to meet him at his house on the last Friday of the month. . . . At last they grew so numerous, that the ministers thought fit that some of them should be still with them to prevent what hurt might follow." Within the Episcopal Church, and supported by its endowments, Blair, Livingstone, and others maintained a Scottish Presbyterian communion. From 1625, however, to 1638 the history of Presbyterianism in Ireland is one of bare existence, not of progress. The ministers, silenced by Wentworth, fled finally to Scotland, after an ineffectual attempt to reach New England, and there took a leading part in the great movement of 1638. In 1639 the "black oath," which forbade the making of any covenants, was forced by Wentworth upon the Ulster Scots. His absence in 1640 raised hopes which were destroyed by the Irish rebellion of 1641, whereby the Protestant interest was for the time ruined. The violence of the storm had, however, fallen upon the Episcopal Church, and her desolation made the rise of Presbyterianism more easy. A majority of the Ulster Protestants were Presbyterian, and in the great revival which now took place the ministers who accompanied the Scottish regiments took a leading part. Sessions were formed in four regiments, and the first regular presbytery was held at Carrickfergus on Friday 10th June 1642, attended by five ministers and by ruling elders from the four regimental sessions. This presbytery supplied ministers to as many congregations as possible, and for the remainder the ministers were sent from Scotland with full powers of ordination. Many of the Episcopal clergy also joined the

winning side, and by the end of 1643 the Ulster church was fairly established. Ireland was included in the Solemn League and Covenant, though the oath was not taken until March 1644. So strong were the Presbyterians that their request that the whole army should be subjected to their discipline was at once granted; and, when a number of Episcopal ministers formed themselves into a presbytery of their own, but without lay eldership and subjection to higher courts, the jealous zeal of the Scots found means to break it up. Meanwhile they were in constant communication with Scotland, of whose system Ulster can best be regarded as a part. In 1645 they were strengthened by the Scots who fled from Montrose, and by the presence of the commissioners of the parliament, who ordered that the covenant should be tendered to all who had not yet taken it. The commissioners also gave the tithes of parishes to ministers who applied for them, and their sanction as a civil power to the presbyteries to censure and punish scandalous ministers. It should be noted that this assumption by the civil power was much scrupled by the ministers as savouring of Erastianism, and the commissioners had to explain away their action. The celebrated vote of the English House of Commons on 14th March 1646 was the first check; the second was the crushing defeat of the Scottish troops at Benburb by O'Neill. Nevertheless by 1647 there were, besides the chaplains of Scottish regiments, nearly thirty ordained ministers with fixed charges in Ulster. When the affair of the "engagement" took place, both the Scottish parliament and the general assembly sent to secure the Irish vote. The presbyteries obeyed the church, the regiments the parliament. After the Scottish defeat at Preston the English parliament, now entirely anti-Presbyterian, determined to attack the Scots in Ulster. In this they were so well served by Monk that by the end of 1648 the Independents, as opposed both to Prelatists and Presbyterians, were superior, and by the end of the year were supreme. Independency became the state church, and the Presbyterian clergy were excluded from the garrison towns. In spite, however, of their downfallen condition, they absolutely refused to take the oath of the engagement, which bound men to be faithful to the Commonwealth without a king or House of Lords, whereupon the most important among them were arrested, while the rest fled to Scotland. During 1651 they were excluded from the pulpit and deprived of their tithes, and in March they were formally banished by a council of war, while the engagement oath was pressed on all classes.

Inde-
pendency
supreme.

Upon Henry Cromwell's arrival, the Protector's object being to reconcile all parties to his sovereignty, the penalties for refusing the engagement were remitted; ministers were allowed to officiate without restraint; and the banished ministers returned. So rapidly did their number increase that by 1655 three bodies performing all the functions of regularly constituted presbyteries had been formed, acting under commission of the whole presbytery. Meanwhile, however, no settled maintenance was available, and it was with great difficulty that the council was induced to afford two years' salary. One illustration of the united state of this church and of its autonomy is to be found in its action regarding the schism in Scotland between Protesters and Resolutioners. At a general meeting at Bangor it was determined, by the Act of Bangor, 1654, that, "though some differed in opinion from the rest, yet there should be no mutual contestings about the differences in Scotland among themselves, nor any owning of them on either side in public preaching or prayer. But, whatever mention might indirectly be made of these divisions, it should be in order to healing them in Scotland." Under Henry Cromwell all sects pursued their course in peace, and the Presbyterians especially increased their strength until the

Presby-
terianism
restored.

Restoration, in which they heartily co-operated, assisting Sir C. Coote in the *coup de main* which secured Dublin for the king. There were now in Ulster seventy ministers in fixed charges, with nearly eighty parishes or congregations, containing 100,000 persons. These ministers were in five presbyteries, holding monthly meetings and annual visitations of all the churches within their bounds, and coming together in general synod four times a year. An entire conformity with the Scottish Church was maintained, and strict discipline was enforced by kirk sessions, presbyteries, and house-to-house visitations.

At the Restoration the determination of the Govern-^{History since the Restoration.} ment to put down Presbyterianism was speedily felt in Ireland. In January 1661 the lords justices forbade all unlawful assemblies, under which head were placed meetings of presbyteries, as exercising ecclesiastical jurisdiction not warranted by the laws of the kingdom. In a discussion with Jeremy Taylor they upheld the *jus divinum* of Presbyterianism and refused to take the oath of supremacy without the qualification suggested by Ussher. At first their parishes were merely declared vacant and Episcopal clergy appointed to them; but shortly afterwards they were forbidden to preach, baptize, or publicly exhort. In Ulster alone sixty-one ministers were ejected; only seven out of seventy conformed. Conventicles, of course, arose, conducted chiefly by young Covenanting ministers from Scotland, of whom the ablest, most indefatigable, and most obnoxious to the authorities was Michael Bruce.

The abortive attempt of Blood, in which he endeavoured to associate the Presbyterians, brought fresh trouble, and the Ulster ministers were with a few exceptions compelled to leave the kingdom. Ormonde, indeed, refrained from harassing them; but it was not until 1665 that the unmolested return of the ministers enabled them to revive their worship and discipline. Presbyteries without ruling elders were organized in private houses, parishes were regularly visited, chapels were built, baptisms were performed, help was sent to the brethren in Holland, and offenders once more came under the active discipline of presbyteries and kirk sessions. A committee which met in place of the regular synod went so far as to insist that all irregular baptisms should be regularly performed. The toleration afforded them is remarkable when compared with that in England and Scotland.

Hitherto, thanks to the wise Act of Bangor, the church had had peace within her own borders. It was not until 1671-72 that this was broken by David Houston, who showed an impatience of ecclesiastical restraint and opposed the settled ministry. This led to the drawing up in February 1672 of a series of regulations as to conducting the trials, ordination, and settling of ministers. Houston left Ireland in 1673, but the schism created by him lasted till 1840 in the Reformed Presbyterian Church of Ireland. In 1672 the Presbyterian Church received from Charles II. a sum of £600 from the secret service fund.

For several years the church prospered, not only in the north, but in the south and west as well. In 1679 the rising in Scotland, which ended in the battle of Bothwell Brigg, brought trouble on the Irish Presbyterians, in spite of their loyal addresses disowning it. It was not, however, until 1682 that they again lost the privilege of public ministry and that oppression became so severe. They cordially concurred with the Episcopalians against James II., though they had benefited by his Declaration of Indulgence, and were the first to congratulate William III. on his arrival in England. During the war several of them took an active part in the siege of Londonderry; the rest fled to Scotland. A list sent in by them to the general assembly shows that there were then in Ireland a hundred congregations, seventy-five with fixed ministers, and that there

were eighty ministers under five presbyteries. With the close of the war came the close of their troubles, as under William they enjoyed complete toleration. So hopeful were they of regaining supremacy that they sent up a petition to the crown that, since the north of Ireland was almost entirely peopled by Scottish Presbyterians, Episcopacy might be done away with in that part. In 1731 again a deputation of ministers and elders went to Dublin with the vain request that their church might receive legal recognition and be placed on an equal footing with the Episcopal Church. Irish Presbyterianism presents no feature of note until 1840, when the original synod of Ulster and all seceding Presbyterian churches united themselves in the "General Assembly of the Presbyterian Church of Ireland." In 1881 there were 36 presbyteries with 552 congregations, containing 101,403 communicants, with 621 ministers. Their synods meet in Belfast. Entirely independent of other churches, they, like those in England, live in friendly union with the Scottish Church. Both English and Irish Churches are in sympathy with the Free Church on the questions which brought about the Disruption of 1843.¹

Organi-
zation of
French
churches.

France.—The extension of the Genevan system on the synodal side became necessary as soon as it was applied to a large community. Up to 1555 the organization of the French churches had been incomplete: there had been no settled clergy nor regular administration of the sacraments. In that year, however, at the suggestion of De la Ferrière, a church was formed at Paris on the Genevan plan, complete in all points, with La Rivière for pastor; and in a few years the organization was set up in Meaux, Angers, Poitiers, Bourges, Nîmes, Blois, Tours, and Orleans. By 1559, according to Théodore de Bèze, there were in France 2150 organized churches; in 1562 Cardinal St Croix reckoned the Huguenots as being one-half of the population. These churches were isolated, and therefore weak. The step needed to repair their weakness was taken as it were by accident. Antoine Chandieu, minister at Paris, while at Poitiers in 1558, found there several ministers from the neighbourhood. It struck them that it would be serviceable to have a common confession of faith and system of government. Thereupon the consistoire of Paris summoned a synod, *not, however, to attribute to this church any special pre-eminence or dignity.* On 26th May 1559 the representatives of eleven churches met in the first national synod and laid down a confession of faith (drawn up by Chandieu) and a system of discipline. The confession, in forty articles, was purely Calvinistic. The emphasis with which the right and duty of the magistrate to interfere on behalf of the truth are insisted upon is important. Foremost in the discipline, as in the confession, comes the fundamental statement of perfect equality: "Aucune église ne pourra prétendre primauté ni domination sur l'autre; ni pareillement les ministres d'une église les uns sur les autres; ni les anciens, ou diacres, les uns sur les autres." A breach of this law was sternly condemned by the synod of Orleans in 1562.

Next to the *consistoire*, which, as being well understood, is not mentioned, came the *colloque* (not finally settled until 1572), consisting of the minister and an elder from each church of the district. In 1637 a colloque was composed of representatives from about ten churches. This met twice a year at least and took cognizance of disputes, but had no initiative power. Each province contained in 1637 three or more colloques. Above the colloque was the *provincial synod*, also containing a minister and an elder or deacon for each church in the province. This synod met once a year. Finally, there was the *national synod*, which met every year if possible.

¹ See Reid, *Hist. of Presby. in Ireland*; Carte, *Ormond*.

(1) Ministers were not elected by the congregation (not Church even by a minister and his consistoire), but by two or three officers, ministers with their consistoires, by the provincial synod, or by the colloque. If the congregation objected, the consistoire was to inquire how far the objection was valid; if the consistoire upheld the congregation, the provincial synod had the final right of decision (art. 7). In 1572, however, the synod of Nîmes laid down the principle that no minister might be imposed upon an unwilling people. (2) In the first forming of a church the elders and deacons were elected by the people; but here the power of the congregation ceased. Future vacancies were filled up by the votes of those remaining. The eldership was *not* to be for life; but there was always a tendency to make it so. In 1565 the synod of Paris warned the churches not to change without urgent cause, so too in 1572 at Nîmes. In 1596, however, it was decided that they were to be changed whenever expedient. (3) The office of deacon was of great importance; besides having the charge of the poor and sick, he might catechize and, if the minister were ill, offer prayer and read a written sermon. He was a member of the consistoire, but apparently without the right to vote. In 1572 his dignity was increased, and (compare "readers" in Scotland) he was regarded as preparing for the ministry. As regards the consistoire,—if a parish was without one, it must be created; if a great lord had a congregation in his own family, one must be formed from it. In 1565 the power of excommunication was given to it, and it might depose elders and deacons, with appeal to the provincial synod. Its right to manage the affairs of its own church was strongly asserted in 1563, 1565, and 1571 at the synods of Lyons, Paris, and La Rochelle. One of the ministers was president, but only as *primus inter pares*. Over all marriage and baptismal questions it had jurisdiction so long as it avoided interference with the civil Government by dissolving marriages. The attention paid to marriage by Presbyterianism in all countries is worthy of notice. The ruling idea is the intense sanctity of the tie. Only in case of adultery might it be broken in France. A contract of marriage was declared indissoluble by the synod of Lyons (art. 44) in 1563, though the woman averred that she had been forced into it and that the man had a loathsome disease. Still more remarkable examples might be quoted.² The office of elder was far more limited than in Geneva; his supervision over morals was, for example, confined to reporting scandals to the consistory; but in 1572 this was greatly extended. The remarkable feature of the French system is its aristocratical nature: the consistory, by the method of co-optation, was a purely aristocratic council, and the greatest pains were taken by the various synods to crush all attempts towards giving power to the congregations (*e.g.*, the condemnation of Jean Morelli, 1562-72, and the synods of Verteuil in 1567 and La Rochelle in 1571).

In the national synods, also, the aristocratic formation Synods soon asserted itself. Up to 1565 every church sent a minister with one or two elders or deacons. On questions of discipline elders or deacons might vote, on doctrinal questions only as many laymen as ministers. In 1565, however, to avoid overcrowding, the national synod of Paris determined that for the future only one or two ministers and one or two elders, chosen by each provincial synod, should be admitted. Thus the national synod, which had hitherto represented single churches, now represented only the provincial synods, which of course gained immensely in importance.

The church disclaimed any encroachments upon the civil

² For the method of constituting a consistory, for its supervision of private life and public morals, see Borrel, *Histoire de l'Eglise de Nîmes*, pp. 61, 96, 117.

Relations to the state.

authority (compare the national synods of Lyons, Figeac, La Rochelle, Montauban, 1563, 1579, 1581, 1594). But in M. Borrel's work, especially valuable as showing what went on in a single church, we find that so early as 1561 Presbyterianism was following its natural bent. "À mesure que son pouvoir grandit, il impiéta sur le domaine du gouvernement civil, et crut pouvoir prendre des mesures pour la défense . . . pour ordonner, qui plus est, les levers d'argent. . . . En un mot, la police, la garde de la ville, l'inspection de la conduite des habitants, . . . devinrent graduellement l'objet de ses délibérations et de ses règlements." And a stern stand was made against the supremacy of the state. In 1571 the minister of Bordeaux reported to the synod of La Rochelle "qu'un médecin soutient que le magistrat est le chef de l'église et que ce que les ministres entreprennent n'est que tyrannie." The synod rejected "l'erreur du dit médecin et de tous autres qui veulent abolir la discipline de l'église en la confondant avec le gouvernement civil." The language of the synods will be found to vary as their political prospects vary.

Progress of Protestantism.

The cause of the astonishing progress of Protestantism and the extent to which it was but one phase of a general movement for reform may be seen in the proceedings of the states-general at Orleans in December 1560, where, both in the noblesse and in the tiers-état, loud complaints were uttered against the clergy (Félice, p. 117), and freedom of worship was demanded. Only a few months afterwards a proposal was made by a magistrate of Autun to sell all the church lands, to retain a fourth of the sum for the support of the priests, and with the rest to pay off the crown debts and encourage agriculture and commerce. The disbelief in the possibility of two widely varying religions living side by side is shown in the proposals of all the speakers for a national council to settle variances. "Ôtons ces noms diaboliques," said De l'Hôpital, "ces noms de partis, factions, et séditions—*Luthériens, Huguenots, Papistes*—ne changeons pas le nom de Chrétien."

Great forces were contending for Protestantism; it had the goodwill of three-fourths of the nobles and of the bourgeoisie in the principal towns. But against it were ranged the strength of tradition and of habit; the craft of Catherine de' Medici, to whom all religions were equally matters of policy; the ambition of the Guises, backed by Spain; the interests of the clergy, backed by the pope; and the Paris mob. And there was another influence, perhaps still more powerful. One of the greatest obstacles to the success of a new religious movement in a country of strong national feeling will be the existence of a strong national church. The church of France was Gallican, anti-papal, practically and essentially national. In spite of manifold corruptions she had become the centre of much national attachment. As was the case in England, she represented the idea of nationality in a concrete form, and in this lies to a great measure the explanation of the fact that the Huguenots had so long to fight for the right to exist.

Struggles against Roman Catholicism.

By September 1561 the situation had become intolerable. The colloquy of Poissy then met, as desired by De l'Hôpital. It made but one thing clear: union was impossible; extermination for one of the conflicting faiths, or their concurrent existence, were the alternatives. The edict of January 1562 marked the conditions on which the latter was adopted. One remarkable provision was that ministers should swear *before the civil magistrate* to preach according to the word of God and the Nicene creed. By March war had begun; the peace of Amboise in March the next year gave the Protestants some privileges, which, however, were afterwards much restricted, especially in the matter of synods, in August 1564; and the armed truce lasted until 1567. During these years the churches consolidated themselves. At Nîmes, for example, the Genevan

discipline was established in full rigour. The tendency of the consistory to encroach on the civil domain was shown in many ways, while the closely aristocratic nature of the French system appeared from the fact that at each annual election the outgoing members formed a body called the "old consistory," which was joined with the new consistory for election of ministers and all ordinary affairs. Its ministers were of two classes—the one ordinary and perpetual, the other temporary, such as the professors at the theological college.

The wars of 1567 displayed the value of the facility for union, which was one of the most important features of the Presbyterian polity. During three years of horrors meetings both of consistories and of provincial synods were held. In April 1571, at the peace of St Germain en Laye, the seventh national synod at La Rochelle reaffirmed the confession of faith. In May 1572 a very important synod was held at Nîmes, in which the whole church system was carefully revised and developed in many important respects, some of which have been mentioned. The rigidity of the Calvinistic faith was illustrated by the sentence of excommunication against ministers or elders who caused any dispute touching doctrine, ceremonies, or discipline, and the Puritan temper by the prohibition "assister aux spectacles profanes, comme aux danses de théâtre, aux comédies," &c. The church senate, the difference of which from the consistory it is difficult to trace, was now merged in it, and care was taken to get rid of wandering and uncertified ministers by drawing up a "rôle des vagabonds."

By the end of 1573 the positions of the Catholics and of the "religion prétendue réformée," as it was henceforward officially known, had greatly altered. Against the Italian and Spanish influences, as represented by Catherine and the Guises, there had after St Bartholomew's Day arisen a patriot Catholic party; while the Presbyterians had become sharply divided into two bodies,—one the Consistoriaux (the Covenanters of France), careful only for the purity and free exercise of their religion, and the other the Aristocracy (as in Scotland), who, having become Presbyterian for political purposes, were now fearful of seeing themselves excluded from political life, and were therefore anxious for union and compromise. This party formed a league with the Catholic patriots, and, as the "tiers-parti," was so threatening that Henry III., to sever the alliance, offered to the Calvinist Aristocracy the free exercise of their religion, and, what they were far more anxious about, full participation in public employments and the re-establishment of their chiefs in their former positions. Fighting, however, again broke out in the beginning of 1577, and was adverse to the Presbyterians, who nevertheless held a national synod at Sainte Foy in 1578, attended by a commissioner from Henry of Navarre. Very remarkable is the strictness with which in a time of desolation the laws of the church were maintained. The lukewarmness of the Presbyterian Aristocracy had made the ministers stern and unyielding, and they now gained great influence. In this respect too the course of things was very analogous to that in Scotland. In both countries the ministers threw themselves upon the lower middle classes as distinct from and opposed to the aristocracy. In 1585 Henry III. came to terms with the Guise faction at Nemours on condition of exterminating Calvinism. This, however, was under the stress of circumstances; his policy was to play off one party against the other, and he soon became lukewarm in persecution. Along with Henry of Navarre he was excommunicated by the pope; he replied by defiance, murdered Guise, was compelled by the abhorrence thus created to join the Protestants, marched with Navarre on Paris, and was there, in 1589, assassinated. To gain the Catholics and to retain the Presbyterians was

Political Presbyterian party.

Henry IV.'s task after Ivry. To secure the latter he put out an edict of toleration; to gain the former he was "converted" to Catholicism in 1593. The Presbyterian Aristocracy now took a most important step. In May 1594 they held a *political* meeting at Sainte Foy and formally established a political *imperium in imperio* of the most decided character. France was divided into ten sections for administrative purposes. There was a general council of four nobles, four bourgeois, two clergy,—the numbers being afterwards raised to twelve, twelve, and six. Under the general council were the provincial councils of five or seven members, of whom only one was necessarily a minister. The general council acted as an intermediary between the whole body of the Calvinists and the king. Owing doubtless to its operation Henry, whose leading idea was national unity, in April 1598 ("l'an de salut") put forth the Edict of Nantes, which practically conceded entire liberty of conscience to the Presbyterians. The truce lasted during the rest of Henry's reign. Synods were regularly held, and the language of controversy became more bitter. At Gap, in 1603, the pope was declared to be Antichrist, and this declaration was in force until 1637, when the synod of Alençon was compelled to expunge it. At the synod of Gap it was reported that there were 760 organized churches, with 565 ministers. The ministry now received from the king a subsidy of 40,000 crowns, the distribution of which took up a large part of the time of subsequent synods. In spite of the confirmations of the Edict which followed Henry's death, the anxious Presbyterians held another political synod at Saumur in 1611, when they swore faith to the crown, "le souverain empire de Dieu demeurant toujours en son entier." In 1620 the political assembly met at La Rochelle, when they confiscated all property belonging to Catholic churches, struck a great seal, levied arms and taxes, organized the church, and divided France into eight military districts. The austerity and intolerance displayed at the synods at this time were intense (see Buckle, vol. ii. p. 57, ed. 1867). The war, however, was disastrous to the Presbyterians, and at the peace of Montpellier the cessation of political meetings was insisted upon. The policy of Richelieu was that of Henry IV.,—protection as regarded religion, and a steadfast refusal to permit any political "league" which tended against the concentration of French nationality. The result of his treatment of combined conciliation and repression and of the attractions of the court on the nobility was that the Presbyterians, as a political party, ceased to exist. The number of churches, too, greatly diminished: in 1603 there were 760, in 1619 only 700. Mazarin pursued the same course; and his assent in 1660 to the synod of Loudun was the last favour they received.

Period of
persecu-
tion.

The action of the fourteen synods held since 1600 had been (as was also the case in Scotland) in the direction of increasing the power of the minister and diminishing that of the elders and congregations (Vitré in 1603, La Rochelle in 1607, and Gap in 1617), and to define the relations with the state. From 1623 (Charenton) a royal commissioner was always present, and year by year the increasing subserviency of their language shows that the national synods were coming more and more under royal control. In 1637 (Alençon) the royal commissioner, who openly taunted them with their powerlessness, forbade not only the provincial synods but even intercourse of the national synods with the provinces. In 1657 meetings for the choice of ministers were prohibited, and then the colloques were suppressed. At Loudun in 1659 the national synod was forbidden and the provincial synods were restored. The greatest jealousy, too, was shown by the crown in respect of communication with other countries. No one might be a minister who was not born in France,

or who had studied in Geneva, Holland, or England, the hot-beds of republicanism. The Presbyterians showed a corresponding desire for union with other Protestants. In 1620 they accepted the confession of the synod of Dort; in 1631, for the first time, they held out the hand of fellowship to the Lutherans. In 1614 an attempt had been already made to convene a general council of orthodox churches from all Protestant countries; and an oath of union was taken among themselves, repeated at Charenton in 1623. With two parties alone they would accept no union, Roman Catholics and Independents.

Of the time of horrors which reached its climax in the revocation of the Edict of Nantes in 1685 we can give no account here. The provincial synods were held continuously and were of great importance in preserving the vitality and spirit of the church. Thus in 1661 the provincial synod of Nîmes checked defection by compelling every minister within its bounds to swear that he had not thought of joining "light to darkness and God to Belial."¹ It is reckoned that under the persecution, in addition to the killed, from four to five millions of French Protestants left the country. Armed resistance took place, but no settled struggle until 1702, when the war of the Camisards took place in Languedoc,—a war of uneducated peasants without arms or leaders of rank. Like the Cameronians, they believed that they received direct communications from God; they had their prophets or "inspirés"; they lived in a state of religious ecstasy, and bore with patient defiance spoliation, the galleys, and death; and, when opportunity offered, they exercised against their enemies reprisals as cruel as was the persecution itself. For three years every effort to crush them was made in vain; and they yielded at last only to the moderate measures of Villars.

To abolish the undisciplined rule of the "inspirés" and to Antoine restore Presbyterianism, which had ceased since the revocation, was the work of Antoine Court, the most notable figure produced by Protestant France. From 1715 to 1730, without a day's rest, this man accomplished a work truly marvellous. He was but eighteen years old when he began it. In momentary peril of death for fifteen years, he restored in the Vivarais and the Cevennes the Presbyterian constitution in all its integrity. On 21st August 1715 he assembled his first colloque, consisting of the preachers of the Cevennes and several laymen. In 1718 he held a synod of forty-five members, and again in 1723, when the old discipline was restored. In 1726 he held another synod attended by three ministers and forty-four elders, and again in the next year; and in 1744, in a remote spot of Bas Languedoc, the first national synod since 1660 brought together representatives from every province formerly Protestant. This alarmed the Government, and persecution again began. From 1760, however, thanks to the gradual spread of the sceptical spirit and to the teachings of Voltaire, more tolerant views prevailed; synods were held without disturbance; and in 1787 Turgot, whose great object was to separate the civil and the spiritual domains, put out the Edict of Toleration. In 1789 all citizens were made equal before the law, and the position of Presbyterianism improved up to 1791. Napoleon in 1801 and 1802 took into his own hands the independence of both Catholic and Protestant churches. The consistory was abolished and replaced by an "église consistoriale," uniting several churches. Representation on the "premier consistoire" of this "église" was now determined by taxation instead of by choice of the people. Five "églises consistoriales" formed a "synode d'arrondissement," which superseded the provincial synod. It consisted of ten members only, and was absolutely under state control. The

¹ See Borrel for this and for a most interesting account of the action of the consistory of Nîmes in 1663.

national synod was abolished. "C'était une liberté interne et murée dans les temples. Il y avait rigoureuse défense de faire aucun bruit, aucun mouvement dans les choses de religion, ni journaux, ni associations, ni controverse, ni prosélytisme; et si quelqu' idée ou action religieuse osait franchir l'enceinte où elle était emprisonnée, la main de fer de Napoléon l'y refoulait immédiatement." Its life was taken from the church, and in 1807 it numbered less than 200 ministers.

In 1848, however, all but three of the ninety-two "églises consistoriales" sent a deputy to an assembly at Paris. From this assembly, when it refused to discuss points of doctrine, a secession took place, and the secessionists with the independent churches which had sprung up formed the "Union des églises évangéliques de France." This society held a synod in 1849 and there laid down a confession of faith and an ecclesiastical discipline. Meanwhile the established church set itself to the work of reconstitution on the basis of universal suffrage (with restrictions), the particular church being an essential element, with provincial synods, and a general synod meeting at regular intervals; but no result was arrived at. In 1852 a change took place in its constitution. The "églises consistoriales" were abolished, and in each parish a presbyterial council was erected, the pastor being president, with from four to seven elders chosen by the people. In the large towns there were consistories composed of all the pastors and of delegates from the various parishes. Half the elders in each assembly were subject to re-election every three years. Above all was the central provincial council, consisting of the two senior pastors and fifteen members nominated by the state in the first instance. All property qualification for eldership was abolished. In 1858 there were 617 pastors, and the subvention from the state amounted to 1,375,936 francs. The "Union des églises évangéliques" numbered twenty-seven churches.¹

Constitution of 1852.

Position in the Netherlands.

The Netherlands.—From the geographical position of the Netherlands Presbyterianism took there from the beginning its tone from France. In 1562 the *Confessio Belgica* was revived, according to the French *Confession* of 1559, and publicly acknowledged; and in 1563 the church system was similarly arranged. In 1572, however, in the northern provinces alone, which had been chiefly Lutheran or Melancthonian, serious schisms took place. The invasion of Alva of course destroyed all Protestant order, and it was not until the Union of Utrecht in 1579 that the exiled Presbyterians returned. Previous to this, however, in 1574, the first provincial synod of Holland and Zealand had been held; but William of Orange would not allow any action to be taken independently of the state. The Reformed churches had established themselves in independence of the state when that state was Catholic; when the Government became Protestant the church had protection, and at the same time became dependent: it was a state church. The independence of the church was not consistent with that of the communes and provinces, each of which by the Union of Utrecht had the regulation of its own religion. Thus the history of the church is one of constant conflict. Both church and state were divided, the former into Zwinglian and Calvinist, the latter into those who desired and those who refused a non-Erastian church. In most cases it was insisted on as necessary that church discipline should remain with the local authority. In 1576 William, with the support of Holland, Zealand, and their allies, put forth forty articles, by which doctors,

elders, and deacons were recognized and church discipline given to the elders, with appeal to the magistrate, but which placed the church in absolute dependence on the state. These articles, however, never came into operation; and the decisions of the synod of Dort in 1578, which made the church independent, were equally fruitless. In 1581 the Middelburg synod divided the church, created provincial synods and presbyteries, but could not shake off the civil power in connexion with the choice of church officers. Thus, although Presbyterian congregations remained the rule, the civil Government retained overwhelming influence. As the Leyden magistrates said in 1581, "If we accept everything determined upon in the synods, we shall end by being vassals of the synod. We will not open to churchmen a door for a new mastership over Government and subjects, wife and child."

The contest between Zwinglian and Calvinist came to a decision at the synod of Dort, 1618. Arminius, on the one hand, inveighed against church autonomy as a new pope-dom; Gomarus defended it. The oligarchy supported Arminius; the democratic party, headed by the stadtholders, held with the Calvinists. The question at first was whether synods should be provincial or general. The independent provinces were naturally for provincial synods, as Arminius wished, the states-general for a national synod. The synod of Dort, wherein were represented all Reformed churches, decided against Arminius. When that was settled, the church system, as laid down in 1586 at the synod of The Hague (called by the earl of Leicester), and including general synods, was confirmed. This, however, was accepted only in Utrecht and Guelders; and from 1619 to 1795 there were seven church republics with more or less state interference. The synodal form predominated, except in Zealand, and the Presbyterian form also, except in a few congregations which did not choose elders. As a rule elders held office for only two years. The "kerke raad," or kirk session, met weekly, the magistrate being a member *ex officio*. The colloque consisted of one minister and one elder from each congregation. At the annual provincial synod, held by consent of the states, two ministers and one elder attended from each colloque. Every congregation was annually visited by ministers appointed by the provincial synod. The old controversy broke out again in the middle of the 17th century, Johann Cocceius and Gisbert Voet being the Arminian and Calvinist champions. The state made good its power in every case.

In 1795, of course, everything was upset; and it was not until after the restoration of the Netherlands states that a new organization in 1816 was formed. Its main features were that it was strictly synodal, with a national synod, and Presbyterian. But the minister was greatly superior to the elder, and the state had wide powers, especially in the nomination of higher officers. In 1827 a new organ was brought into play, viz., a permanent commission of the general synod, consisting of seven members, chosen by the king from twice their number nominated by the synod, meeting twice a year. This was revived in 1847. In 1851 the system now in force was formed. In every congregation sufficiently large there is a church council of all the officers. In large congregations with three or more ministers the ministers and elders alone form one college, the deacons another. The congregation chooses all officers. There are 43 presbyteries in 10 provincial districts; in 1850 there were 1273 congregations with 1508 ministers and over 1,500,000 people. The special provincial synod (1619-1795) has ceased. In its place is the provincial authority of as many ministers as presbyteries in the province; it chooses its own president. It meets three times a year, and has general superintendence, with power of examining, placing, and deposing ministers. A general

¹ For Presbyterianism in France, see De Félice, *Hist. des Protestants de France*; Aymon, *Synodes Nationaux des Églises Réformées de France*; Borrel, *Hist. de l'Église Réformée de Nîmes*; Bèze, *Hist. Ecclésiastique*; Weber, *Geschichtliche Darstellung*, &c.; Coquerel, *Hist. des Églises du Désert*; Vincent, *Vue sur le Protestantisme en France*; Buckle, *History*.

synod meets at The Hague every July; the ten provincial authorities send each one minister and three elders, chosen by each of those authorities in turn, and a deputy from each of the three theological colleges of Leyden, Utrecht, and Groningen. The commissions for the Walloon, East and West Indian, and Limburg churches also send each a representative. The permanent commission is chosen by the synod itself, and altogether the church is independent of the state.

Rhine
pro-
vinces.

Rhine Provinces.—In the Palatinate the spirit of the Presbyterian organization, though not the thing itself, had been active since the middle of the 16th century; and in 1568 Withers of Heidelberg, an Englishman, urged the establishment of the eldership. In 1570 Frederick III. established a church college in every congregation. Elders were for life. Besides the college or kirk session there was the church council in Heidelberg, consisting of three theologians and three laymen; one of the latter presided. These were all nominated by the Government. Between the church council and the various colleges were superintendents or inspectors. Finally there were synods, provincial and general, of ministers only. This arrangement was a compromise between the Lutheran and Presbyterian systems. From 1576 to 1583, after Frederick's death, the system was again Lutheran, but was made Presbyterian once more by John Casimir, tutor to Frederick IV., and so it remained. The churches of the lower Rhine were formed at first entirely by foreign refugees. Walloons fled from Charles V.'s persecution in 1545, and again in 1553-54. In 1564 the Heidelberg catechism was introduced. Thousands of Protestants were driven hither by Alva in 1567-68, and in the latter year a synod was held at Wesel of forty-six preachers and elders from twenty Netherland churches. The Presbyterian system was now fully introduced. For the election of ministers and elders, until synods could be regularly established, twice as many were to be nominated as were wanted, and then the congregation was to choose by individual voting. A "collegium prophetarum" was to be formed of all the officers and learned laymen for Bible exposition every week or fortnight. In 1571 the synod of Emden determined that half the elders and deacons were to give up office every year, but might be re-elected. Readers, on the Scottish plan, were appointed, and entire parity among all the church officers and the congregation insisted on. The synods are as in France, the members of the general synod being chosen from the provincial synod. The system was in fact partly French and partly Scottish. The congregations were in three divisions—(1) Germany and East Friesland, (2) Netherlands, (3) England. In 1586 a synod was held at Nassau, and the system was partially introduced in Westphalia in 1588; in general, however, in Lutheran countries Presbyterianism made but little way against the consistories. Its prevalence in Germany generally was too partial and obscure, and it partook too much of the consistorial character, to require notice here.

Poland.

Poland, &c.—The Polish nobility and all of Slav blood accepted the "Reformed" doctrine and discipline, the aristocratic republican system suiting the national polity. The German element, however, retained Lutheran sympathies. The first synod was held at Pinkzow in 1550; from 1556 John Lasky worked in the interests of Calvinism; in 1570 all parties were united at the synod of Sandomir. By this a common confession was agreed to, but church government was left to be settled by each church. Another general synod was held at Cracow in 1573. In spite of the earnest endeavours of the church leaders, it was found impossible to introduce stringent discipline in the congregations; on the synodal side, however, the system flourished, and the nobles were able to convert the synods into

new aristocratic assemblies. It must be remembered that the Reformation was confined to the nobility, the serfs being neglected. Many of the nobles relapsed to Romanism; this and internal divisions weakened the Reformed cause. In 1634 a synod was held to meet the taunt of the Catholics that no two churches had the same system. From 1655, when the Swedes were in Poland, the influence of synods practically ceased.

The Bohemian Brethren were known of in 1450; in their statutes (1457) discipline, entirely managed by the whole congregation, had an important place; in the 16th century it was specialized, elders being chosen to act with the minister. After the Schmalkald War in 1544 the Brethren were driven to Prussia and Poland. During the 16th century they developed rapidly; their system, sanctioned in 1609, had many peculiarities; it placed, for instance, the supervision of the women with female elders. In 1630 they printed at Lissa their *Ratio disciplinæ ordinis*. The Thirty Years' War destroyed them, except in Great Poland, where they were led by Comenius. Just as different civil governments—e.g., monarchical, aristocratic, democratic—suited different peoples, he said, so it was with religious governments, e.g., Episcopal, Consistorial, Presbyterian. Let all three be welded into one, and we shall have unity from the first, association from the second, propagation from the third. Accordingly their system was a combined one of Episcopacy, consistories, and synods.

In Hungary up to 1550 the Lutherans were supreme; but in 1557 the Calvinists had the majority, and their system was accepted in its entirety in 1558. The race division here also decided the ecclesiastical system. All of German blood in Hungary and Transylvania remained true to Lutheranism, whilst the Magyars and Slavs accepted Calvinism. Continual contests with both Unitarians and Jesuits prevented the free development of Presbyterianism; hence it was confined to the synodal side, and the synods, in which the nobles had special rights, were entirely clerical.

In 1689 the Waldenses introduced Presbyterianism of a peculiar type. The consistory was the civil authority as well as the church authority. For choice of elders each urban district chose three laymen, from whom the consistory chose the district elders for supervision of manners and of the poor. The consistory itself was subject to a church council, consisting of three spiritual and two lay members, which had supreme authority, especially when no synod was sitting. Synods were called by consent of the congregations and of the king. Two laymen were present for each ecclesiastic. (O. A.)

UNITED STATES.

Presbyterianism in the United States is a reproduction and further development of Presbyterianism in Europe. It differs from the latter in that the various types produced in Great Britain and on the continent of Europe combined to produce a new American type.

1. *The Colonial Period.*—The earliest Presbyterian Colonial emigration consisted of French Huguenots under the auspices of Admiral Coligny, led by Ribault in 1562 to the Carolinas and in 1565 to Florida. But the former enterprise was soon abandoned, and the colonists of the latter were massacred by the Spaniards. The Huguenots also settled in Nova Scotia in 1604 under De Monts. The later Huguenot colonists mingled with the Dutch in New York and with the British Presbyterians and Episcopalians in New England and the Carolinas. A Huguenot church was formed on Staten Island, New York, in 1665; in New York city in 1683; at Charleston, South Carolina, in 1686; at Boston, Massachusetts, in 1687; at New Rochelle, New York, in 1688; and at other places.

The Charleston church alone maintains its independence at present.

English Puritanism emigrated under the auspices of the Virginia Company to the Bermudas in 1612. In 1617 a Presbyterian church, governed by ministers and four elders, was established by Lewis Hughes, and the liturgy of the isles of Guernsey and Jersey was used. From 1620 onwards English Puritanism colonized New England. This was of the two types which developed from the discussions of the Westminster Assembly (1643-48) into Presbyterianism and Congregationalism. They co-operated in New England as they did in Old England in the county associations. The Plymouth colony was more of the Congregational type, the Massachusetts Bay colony more of the Presbyterian type. A mixed system was produced which has been happily called by Henry M. Dexter "a Congregationalized Presbyterianism or a Presbyterianized Congregationalism . . . which was essentially Genevan within the local congregation and essentially other outside of it." Presbyterianism was stronger in Connecticut than in Massachusetts. Thence it crossed the borders into the Dutch settlements on the Hudson and the Delaware, and mingled with other elements in Virginia, Maryland, and the Carolinas. Nine of these Puritan Presbyterian churches were established on Long Island, New York, from 1641 to 1670, and three in Westchester county, New York, from 1677 to 1685. In New York city Francis Doughty in 1643 ministered to a congregation of Puritan Presbyterians, and was succeeded by Richard Denton in 1650. Francis Doughty also preached in Virginia and Maryland from 1650 to 1659, and was followed by Matthew Hill in 1667 and others subsequently. Francis Doughty was the father of British Presbyterianism in the middle colonies, but he left it in an unorganized condition.

Dutch Presbyterianism was planted in New Amsterdam, New York, in 1628, when the first Reformed Dutch church was organized by Jonas Michaelius with two elders and fifty communicants. This had a strong Huguenot and Walloon representation. Services were held in the Dutch and the French languages, and subsequently in the English language also. The Dutch churches spread along the valleys of the Hudson, the Mohawk, the Raritan, and the Passaic, and also on the Delaware. They continued in subordination to the classis of Amsterdam, Holland, until 1747.

Irish Presbyterianism was carried to America by an unknown Irish minister in 1668, by William Traill in 1683, and especially by Francis Makemie in the same year, an ordained missionary of the presbytery of Laggan, who was invited to minister to the Maryland and Virginia Presbyterians. He was a merchant and a man of executive ability, and was the chief instrument in establishing the presbytery of Philadelphia, and interesting the Presbyterians of London, Dublin, and Glasgow in the feeble state of their church in America. In 1704 he obtained aid from the London ministers and returned to America with two ordained missionaries, John Hampton (Irish) and George Macnisch (Scotch).

Meanwhile the New England ministers had sent several missionaries to the banks of the Delaware: Benjamin Woodbridge and Jedidiah Andrews went to Philadelphia in 1698-1700; John Wilson became pastor of a Presbyterian church at Newcastle, Delaware, in 1698; Samuel Davis and Nathaniel Taylor supplied other churches in the vicinity. Seven of these ministers organized the presbytery of Philadelphia in 1706. It was a meeting of members for ministerial exercise "to consult the most proper measures for advancing religion and propagating Christianity." The presbytery only gradually learned to exercise oversight over the churches. The ministers constituting it were from many lands and of many types of

Presbyterianism, and could agree only in a loosely organized body. During the existence of the original presbytery the chief sources of support were London, Glasgow, and Dublin in the United Kingdom, and Boston, Massachusetts, and Fairfield county, Connecticut, in New England. Its Presbyterianism was of the broad, tolerant type that we might expect from a happy union of English, Irish, Scottish, and Welsh Presbyterians, with a few Dutch, Germans, and French. In 1716 the presbytery divided itself into four "subordinate meetings, or presbyteries," after the Irish model, and increased its number by a large accession of Puritan churches and ministers from eastern New Jersey and New York.

The synod remained without a constitution and without subscription until 1729. It assumed the functions of Presbyterian government and discipline only gradually, as circumstances required. It developed naturally from its own inherent vitality, and adapted itself to the circumstances of the New World without anxiety as to its conformity to stereotyped models in the Old World. However, two parties developed with the growth of the church. The stricter section urged the adoption of the Westminster standards and conformity thereto; the broader party were unwilling to sacrifice their liberty. The former followed the model of the Church of Scotland; the liberal party sympathized with the London and Dublin Presbyterians. The result of the conflict was union under the Act of 1729, which adopted the Westminster symbols "as being, in all the essential and necessary articles, good forms of sound words and systems of Christian doctrine." It allowed scruples as to "articles not essential and necessary in doctrine, worship, or government." The presbytery was to judge in the case and not the subscriber. This Adopting Act (largely influenced by the Irish pacific articles of 1720) established the American Presbyterian Church on a broad generous basis; but the happy union was brief. In 1730 the stricter party in the presbyteries of Newcastle and Donegal insisted on full subscription, and in 1736, in a minority synod, carried a deliverance interpreting the Adopting Act according to their own views. The liberal men paid no attention to it, except to put themselves on guard against the plotting of the other side. Friction was increased by a contest between Gilbert Tennent and his friends, who favoured Whitefield and his revival measures, and Robert Cross and his friends, who opposed them. The Tennents erected the Log College to educate candidates for the ministry; and the synod passed an arbitrary Act, aimed at the Log College, that all students not educated in the colleges of New England or Great Britain should be examined by a committee of synod, thus depriving the presbyteries of the right of determining in the case. The presbytery of New Brunswick declined to yield, and the body became more and more divided in sentiment. The Cross party charged the Tennents with heresy and disorder; the Tennents charged their opponents with ungodliness and tyranny. Passions were deeply stirred when the synod met in 1741. The moderate men remained away. The Cross party brought in a protestation to the effect that the Tennent party were no longer members of the synod; and thus the synod suddenly broke in two. The New York presbytery declined at first to unite with either party, and endeavoured to bring about a union, but in vain. The Tennent party were found at length to be more reasonable, and the New York presbytery combined with them in establishing the synod of New York, which was called the New Side in contradistinction to the synod of Philadelphia, which was called the Old Side.

During the separation the New Side established Nassau New Hall at Elizabethtown in 1746, and the Log College of the Old Side. Tennents was merged into it. It was removed to Princeton

in 1755, large funds being received from England, Ireland, and Scotland in its aid. Thus the Presbyterians of Great Britain showed their sympathy with the broad and tolerant Presbyterians of the synod of New York; and the college at Princeton was based upon the pledges of Davies and Tennent as to liberal subscription in terms of the original Adopting Act. The Old Side adopted the academy at New London, which had been organized by Francis Alison in 1741, as their own. Thus each side gained an important institution of learning. The division continued until 1758. During this period the synod of Philadelphia decreased from twenty-six ministers to twenty-two, whereas the synod of New York increased from twenty to seventy-two. The New Side reaped all the fruits of the wonderful revival that spread over the colonies under the influence of Whitefield and his successors. The barriers to union were the different views as to subscription and discipline, and the arbitrary act of excision; but they were after a while happily removed, and the Adopting Act was re-established in its original breadth as the foundation of the reunited church. The reunion was signalized by the formation of the presbytery of Hanover in Virginia. The synod increased with great rapidity, by the reception of new ministers, new churches, and also entire presbyteries, until the outbreak of the Revolution and the close of the colonial period, when the synod numbered 11 presbyteries and 132 ministers.

The synod of New York and Philadelphia embraced only a portion of the Presbyterian ministers of the middle colonies. In the Carolinas Presbyterianism had an independent development. There was a considerable Scottish emigration between 1684 and 1687. William Dunlop ministered to them until 1688, when he returned to become principal of the university of Glasgow. A mixed congregation of English Puritans and Scottish Presbyterians was organized at Charleston in 1690. In 1710 there were five churches, which combined to form the presbytery of James Island in 1722-23. This presbytery went through the same struggle with reference to subscription as the synod of Philadelphia, and the parties separated in 1731 into subscribers and non-subscribers.

In 1718 Irish Presbyterianism from Ulster established itself at Londonderry in New England. The church at Londonderry grew into a presbytery in 1726-29, including the Huguenot church of Boston. A second presbytery was organized at Salem in 1745. The original presbytery became extinct owing to internal strife in 1765; but the presbytery of Salem grew into the synod of New England, 31st May 1775, composed of three presbyteries and sixteen ministers. Besides this synod the presbytery of the Eastward was organized at Boothbay, Maine, in 1771 and remained independent. A presbytery of the Puritan type was organized at Grafton, New Hampshire, and continued from 1776 to 1796 independent of other presbyteries.

The Scottish Presbyterians from the established church combined with the American Presbyterian Church, but the separating churches of Scotland organized independent bodies. The Reformed Presbyterian Church ("Covenanters") sent Cuthbertson in 1751 (or 1752); he was joined by Lind and Dobbin from the Reformed presbytery of Ireland in 1774, and they organized an American Reformed presbytery. The Anti-Burgher synod sent Alexander Gellatly and Andrew Arnot in 1752, and they organized the Associate presbytery of Pennsylvania in 1754; they were joined by the Scotch Church in New York city in 1657, a split from the American Presbyterian Church; they had grown to two presbyteries and thirteen ministers in 1776. The Burgher synod sent Telfair and Clark in 1764; the latter settled at Salem, New York; they united with the Associate presbytery of Pennsylvania.

Dutch Presbyterianism in 1747 formed a coetus which grew into a classis in 1755 independent of the classis of Amsterdam. A minority adhered to the mother classis and organized under its supervision a conference which grew into an assembly in 1764. In 1770 Queen's (now Rutgers) College was organized at New Brunswick, New Jersey. A union of the two parties was accomplished through the efforts of Dr J. H. Livingston in 1772, and a synod of five classes was organized, of 100 churches and 34 ministers. At the outbreak of the Revolution they numbered 44 ministers and 105 churches.

German Presbyterians began to emigrate into Pennsylvania in 1684, but not in large numbers until 1709, when a tide of emigration set in from the Palatinate and Switzerland. These attached themselves to the Dutch churches, but, where such did not exist, they organized churches of their own. In accordance with the advice of the German mother churches, in 1730 they put themselves under the care of the classis of Amsterdam, Holland. In 1747 the German churches organized a coetus under the influence of Schlatter, who had found forty-six churches scattered over a wide region in Pennsylvania, but only four ordained ministers. He acted as general superintendent and was very efficient. He sought aid from all quarters, but this excited internal jealousies and controversies. At the outbreak of the Revolution it is estimated that the German churches numbered twenty-five ministers and sixty churches.

The classis of Amsterdam had a magnificent opportunity at the opening of the 18th century. The Dutch, German, and French churches in America were under its care. If it had organized them into classes and a synod at an early date the Reformed Church of America would have been the strongest Presbyterian body in the country, but by keeping them in pupillage it separated the various nationalities and prevented closer union with British Presbyterians. The strength of Presbyterianism in the colonies which became the United States of America may be estimated at the close of the period as 3 synods, 20 presbyteries, 5 classes, 1 coetus, and 260 ministers. The synod of New York and Philadelphia was a trifle stronger than all the others combined.

2. *From the Revolution to the Civil War.*—During the war of the Revolution the Presbyterian churches suffered severely. The ministers and people, with scarcely an exception, entered upon the struggle for constitutional liberty with all their souls. The Presbyterian Church was the church of constitutional government and orderly liberty. The Presbyterians exerted great influence in the construction of the constitution of the United States, and the government of the church was assimilated in no slight degree to the civil government of the country.

At the close of the war the Presbyterian bodies began at once to reconstruct themselves on more solid bases. In 1782 the presbyteries of the Associate and Reformed Churches united and formed the Associate Reformed synod of North America. But there were a few dissenters in both bodies, so that the older Associate and Reformed presbyteries were still continued. The Associate presbytery of two members, Marshall and Clarkson, continued to exist until 1801, when it was subdivided and became the Associate synod of North America. In 1798 the Reformed presbytery of North America was reconstituted by M'Kenney and Gibson from Ireland; it grew into a synod of three presbyteries in 1809, and in 1823 into a general synod. In 1781 the Dutch Reformed organized themselves into a synod and classes. In 1784 they founded a theological seminary, which was settled at New Brunswick, and in 1792 adopted a constitution with general synod, particular synods, and classes. In 1792 the German Reformed declared themselves independent of the classis of

Amsterdam, and adopted a constitution in 1793 having 150 churches and 22 ministers.

In 1785 the synod of New York and Philadelphia took steps for the organization of a general assembly and also with a view to the union of all the Presbyterian bodies into one. In 1789 the synod resolved itself into a general assembly of four synods, which, after revising the chapters relating to church and state, adopted the Westminster symbols as their constitution, "as containing the system of doctrine taught in the Holy Scriptures," and they made them unalterable without the consent of two-thirds of the presbyteries and the general assembly. In 1798 another effort was made for union with the Reformed Dutch and the Associate Reformed, which failed. Three years afterwards a plan of union with the general association of Connecticut was agreed upon by the general assembly, and the work of home missions in the western section of the country was prosecuted jointly. The result was mixed churches in western New York and the new States west of the Alleghany Mountains, which grew into presbyteries and synods having peculiar features midway between Presbyterianism and Congregationalism.

The revivals in Kentucky brought about differences which resulted in the high-handed exclusion of the revivalists. These formed themselves into the presbytery of Cumberland, 4th February 1810, which grew in three years into a synod of three presbyteries. In 1813 they revised the Westminster confession and excluded, as they claimed, fatalism and infant damnation. If they had appealed to the general assembly they might have received justice, or possibly the separation might have been on a larger scale. In 1822, under the influence of John M. Mason, the Associate Reformed synod combined with the general assembly of the Presbyterian Church, but the majority was too slender to make the union thorough. The greater part of the ministers decided to remain separate, and accordingly three independent synods were organized—New York, Scioto, and the Carolinas. In 1858 the Associate synods of the north and west united with the Associate synod as the United Presbyterian Church. In 1833 the Reformed Presbyterian Church divided into New Lights and Old Lights in a dispute as to the propriety of Covenanters exercising the rights of citizenship under the constitution of the United States.

Cumber-
land
presby-
tery.

A great and widespread revival marked the opening years of the century, resulting in marvellous increase of zeal and numbers in the churches. New measures were adopted, doctrines were adapted to the times and occasions, and ancient disputes were revived between the conservative and progressive forces. Theological seminaries had been organized at Princeton in 1812, at Auburn in 1820, at Hampden Sydney in 1824, Allegheny in 1827, Columbia in 1828, Cincinnati in 1829, and Union Seminary, New York, in 1836. Differences in doctrine as well as polity and discipline became more and more prominent. Puritan theology had developed in New England into Edwardism and then into Hopkinsianism, Emmonsism, and Taylorism. A new theology had sprung up which was held to be an improvement and adaptation of Calvinism to modern thought. This new theology had entered the Presbyterian Church in the form of a milder Calvinism, which was represented to be more in accordance with the original type. On the other side the scholastic type of Calvinism, as represented by François Turretin and the Zurich *Consensus*, was insisted on as the true orthodoxy. The doctrinal differences came to a head in the trials of Albert Barnes, George Duffield, and Lyman Beecher, which, however, resulted in the acquittal of the divines, but increased friction and ill-feeling. The differences developed were chiefly between general atonement and atonement for the

elect only and between mediate imputation and immediate imputation. But there was a middle party which regarded these differences as forced, and held that the rival views were alike inadequate if taken alone and that they were really complementary.

The agitation with reference to African slavery threw Old and the bulk of the Southern Presbyterians on the Old Side, New Side, which was further strengthened by the accession of the Associate Reformed. The ancient differences between Old and New Side were revived, and once more it was urged that there should be (1) strict subscription, (2) exclusion of the Congregationalized churches, and strict Presbyterian polity and discipline, (3) the condemnation and exclusion of the new divinity and the maintenance of scholastic orthodoxy. In 1834 a convention of the Old Side was held in Philadelphia, and the "Act and Testimony" was adopted charging doctrinal unsoundness and neglect of discipline upon the New Side, and urging that these should be excluded from the church. The moderate men on both sides opposed this action and strove for peace or an amicable separation, but in vain. In 1837 the Old Side obtained the majority in the general assembly for the second time only in seven years. They seized their opportunity and abrogated the "Plan of Union," cut off the synod of Western Reserve and then the synods of Utica, Geneva, and Genesee, four entire synods, without a trial, and dissolved the third presbytery of Philadelphia without providing for the standing of its ministers. This revolutionary proceeding brought about the second great rupture in the Presbyterian Church. The New Side men met in convention at Auburn in August 1837 and adopted measures for resisting the wrong. In the general assembly of 1838 the moderator refused to recognize the commissioners of the four excised synods. An appeal was made to the assembly and the moderator's decision reversed. A new moderator was chosen, while the assembly adjourned to another place of meeting. The Old Side remained after the adjournment and organized themselves, claiming the historic succession. Having the moderator and clerks from the assembly of 1837, they retained the books and papers. Thus two general assemblies were organized, the Old and the New School. An appeal was made to the civil courts, which decided in favour of the New School; but this decision was overruled on a technical point of law by the court in bank and a new trial ordered. It was deemed best, however, to cease litigation and to leave matters as they were.

Several years of confusion followed. In 1840 we have the first safe basis for comparison of strength.

	Ministers.	Churches.	Communicants.
Old Side ...	1308	1898	126,583
New Side ...	1234	1375	102,060

The churches remained separate throughout the remainder of this period. The North was especially agitated by the slavery question, and the anti-slavery element became so strong that the Southern synods of the New School assembly felt constrained to withdraw in 1858. They organized the United Synod of 4 synods, 15 presbyteries, 113 ministers, 197 churches, 10,205 communicants. Just before the outbreak of the Civil War in 1861 these churches numbered:—

	Synods.	Presbyteries.	Ministers.	Churches.	Communicants.
Old Side.....	33	171	2656	3531	292,927 (1860)
New Side ...	22	104	1523	1482	134,933 (1860)
United Synod	4	15	113	197	10,205 (1858)
Cumberland Presbyterian	23	96	890	1189	82,008 (1859)

The several branches of the Scottish separating churches continued to grow independently until the year 1858, when the United Presbyterian Church was formed by a union of three synods,—one of the Associate and two of the Associate Reformed Churches.

	Presbyteries.	Ministers.	Churches.	Communicants.	Theological Seminaries.
Associate	21	197	293	23,505	1
Associate Reformed (4 synods)	23	225	333	32,118	3
5 Synods	49	422	676	55,623	4

The Dutch Reformed increased, though not without slight internal struggles; in 1822 there was a secession of thirteen ministers. The name "Dutch" was dropped in 1867 because it was found hurtful to the progress of the denomination. At the outbreak of the Civil War they numbered 1 general synod, 3 particular synods, 31 classes, 387 ministers, 370 churches, 50,427 communicants.

The German Reformed in 1816 improved their organization. In 1819 the constitution was revised and the church divided into synods and classes. In 1824 they were divided into two independent synods. In the next year they established a theological seminary at Carlisle, which was removed to Mercersburg, and finally to Lancaster (all in Pennsylvania). This institution became the centre of the liturgical party in the church. The Ohio synod established Heidelberg College in 1850. At the outbreak of the Civil War this denomination numbered 2 synods, 24 classes, 391 ministers, 1045 churches, 92,684 communicants.

In 1826 the first Calvinistic Methodist Church in America was organized in Oneida county, New York, and a presbytery was constituted a few years afterwards. This little denomination, which is in entire sympathy with other Presbyterian bodies, is composed almost exclusively of Welshmen, who have settled in communities by themselves.

3. *From the Civil War to 1885.*—The Civil War in separating the people of the North from the people of the South also brought about a separation of churches. Some of the breaches have been healed, others remain until now.

In 1861 the Southern section of the Presbyterian Church withdrew from the Northern and organized the general assembly of the Presbyterian Church in the Confederate States of America, with 11 synods, 47 presbyteries, about 700 ministers, 1000 churches, and 75,000 communicants. In 1865 this body united with the United Synod of the South, and increased its strength by 120 ministers, 190 churches, and 12,000 communicants. After the close of the war the name of the denomination was changed to "the Presbyterian Church in the United States." In 1867 this church was joined by the presbytery of Patapsco, in 1869 by the synod of Kentucky, and in 1874 by the synod of Missouri, all of which had separated from the Northern church.

The war also united the Northern churches more closely together, and there was an increasing desire for organic union. An effort was made to combine all the Presbyterian bodies of the North in 1867, but in vain. In 1869, however, the Old and New School churches of the North combined on the basis of the common standards. A memorial fund of \$7,883,983 was raised, and the church entered with renewed strength upon a fresh career of usefulness. An effort to unite the Dutch and German Reformed Churches failed, as also the effort to combine the Presbyterian Churches of the North and the South. The German Reformed synods in 1863 united in a general

synod with 26 classes, 447 ministers, and 98,775 communicants. Ursinus College was founded by it in 1869. All branches of Presbyterians have increased with the growth of the United States. The present strength of the churches is as follows:—

	General Assemblies.	Synods.	Presbyteries.	Ministers.	Churches.	Communicants.	Theological Seminaries.

The American Presbyterian churches have always been marked by a zeal for missions. John Eliot, the apostle to the Indians in New England, was a Puritan Presbyterian. The synod of New York carried on mission work among the Indians through David Brainerd and others, with the help of the Society in Scotland for the Promotion of Christian Knowledge. The Presbyterian churches generally co-operated with the Congregationalists in the work of the American Board of Commissioners for Foreign Missions, established in 1710, until 1832, when the Reformed Church in America set the example of organizing a denominational board. Each denomination now has its board of missions. The summary of missionary operations, as reported to the council of the Reformed churches holding the Presbyterian system which met at Belfast in June 1884, was 230 ordained missionaries, 25 male lay agents, and 359 female, all sent out by the societies. These were aided by 138 ordained converts and 1115 other agents from among the converts, and there was a total of 25,235 communicants and 29,060 day-school pupils. The work of home missions is equally extensive, and is especially important in the United States, where the church has to attend to the wants of an immense population constantly flowing from Europe, and the natural increase of population in the country itself also enlarges the older towns and States and creates new ones with astonishing rapidity.

The tendency of Presbyterianism in the United States is to adapt itself to the circumstances of the country. The divisions are chiefly the result of differences of nationality, and traditional doctrines and modes of worship brought by the immigrants from the countries of Europe. These are gradually wearing off, and the churches are assimilating themselves to the country and its institutions, and thus are growing closer together. We may expect at no very distant date a combination of them all into one organism.

The chief authorities for the study of American Presbyterianism are—Charles Hodge, *Constitutional History of the Presbyterian Church in the United States of America, 1706-1788* (2 vols., Philadelphia, 1840); *Records of the Presbyterian Church in the U.S.A. from 1706 to 1788* (Philadelphia, 1841); Richard Webster, *History of the Presbyterian Church in America* (Philadelphia, 1857); E. H. Gillett, *History of the Presbyterian Church in the U.S.A.* (2d ed., Philadelphia, 1873); *Presbyterian Reunion* (New York, 1870); E. B. Crisman, *Origin and Doctrines of the Cumberland Presbyterian Church* (St Louis, 1877); E. T. Corwin, *Manual of the Reformed Church in America* (New York, 3d ed., 1879); *Reformation Principles* (Philadelphia, revised ed., 1863); C. A. Briggs, *American Presbyterianism*, New York, 1885. (C. A. BR.)

PRESCOT, a market-town of Lancashire, is situated on rising ground on the Liverpool and Wigan branch of the London and North-Western Railway, 8 miles east of Liverpool and 28 west of Manchester. It is of considerable antiquity, and received a grant for a market and fair in the 7th year of Edward III. A church existed in the 13th century. The present edifice, in various styles, with a lofty tower and spire and carved timber roof, underwent extensive restoration in 1875-76. Among the other public buildings are the town-hall (1765) and the market-hall (1859). The chief industry is the making of watch hands and wheels, &c., first introduced in 1730 by John Miller from Yorkshire. Coarse earthenware is also manufactured. The population of the urban sanitary district (area, 268 acres) in 1871 was 5990, and in 1881 it was 6419.

PRESCOTT, WILLIAM HICKLING (1796-1859), historian, was born in Salem, Massachusetts, on 4th May 1796, his ancestors, of the old Puritan stock, having migrated from Lancashire about 1640 and established themselves in Middlesex county, Massachusetts. He received his earlier education in his native city until the removal of his family in 1808 to Boston, where he was placed under the tuition of Dr Gardiner, a pupil of Dr Parr. His schooldays appear to have been in the main typical rather than prophetic, though in his passion for mimic warfare and for the narration of original stories some indication of the historical bias may perhaps be discerned. A healthy aversion to persistent work, which even in later years broke at times through his rigorous system of self-discipline, did not hinder him from making a good if somewhat desultory use of his permission to read at the Boston athenæum,—an exceptional advantage at a time when the best books were by no means readily accessible in any part of the United States. He entered Harvard College in the autumn of 1811, therefore, with a fairly thorough mental equipment, but almost at the outset his career was interrupted by an accident which affected the whole subsequent course of his life. A hard piece of bread, flung at random in the Commons Hall, struck his left eye with such force that he fell to the ground; and, though the first shock speedily passed, the sight was irremediably destroyed. He resumed his college work, however, with success in classics and literature, though he abandoned the study of mathematics as one in which he could not attain even an average proficiency. After graduating honourably in 1814 he entered his father's office as a student of law; but in January 1815 the uninjured eye showed dangerous symptoms of inflammation, which for some time refused to yield to remedies. When at last in the autumn he was in condition to travel, it was determined that he should pass the winter at St Michael's and in the spring obtain medical advice in Europe. His visit to the Azores, which was constantly broken by confinement to a darkened room, is chiefly noteworthy from the fact that he there began the mental discipline which enabled him to compose and retain in memory long passages for subsequent dictation; and, apart from the gain in culture, his journey to England, France, and Italy (April 1816 to July 1817) was scarcely more satisfactory. The verdict of the physicians consulted by him was that the injured eye was hopelessly paralysed, and that the preservation of the sight of the other depended upon the maintenance of his general health. His further pursuit of the legal profession seemed out of the question, and on his return to Boston he remained quietly at home listening to a great deal of reading, but with no fixed object in view. On 4th May 1820 he was married to Miss Susan Amory. Prior to his marriage he had made a few experiments in composition which had obtained no further publicity than that of his own circle of friends, but he now finally decided

to devote his life to literature. It must be admitted that he had not hitherto displayed any remarkable aptitude; but having once determined his future occupation he set himself strenuously to the task of self-preparation. With almost amusing thoroughness he commenced the study of Murray's *Grammar*, the prefatory matter of Johnson's *Dictionary*, and Blair's *Rhetoric*, reading at the same time for general purposes of style a series of the standard English writers from the period of Elizabeth onwards. A review of Byron's *Letters on Pope* in 1821 constituted his first contribution to the *North American Review*, to which he continued for many years to send the results of his slighter researches. He next turned to French literature, the irksomeness with which he regarded his studies in this subject being mitigated by incursions into the early English drama and ballad literature. Of the direction and quality of his thought at this time he has left indications in his papers on *Essay-Writing* (1822) and on *French and English Tragedy* (1823). In pursuance of his method of successive studies he began in 1823 the study of Italian literature, passing over German as demanding more labour than he could afford; and so strongly did he feel the fascination of the language that for some time he thought of selecting it as his chief sphere of work. In the following year, however, he made his first acquaintance with the literature of Spain under the influence of his friend and biographer, Ticknor, who was then lecturing upon it; and, while its attractiveness proved greater than he had at the outset anticipated, the comparative novelty of the subject as a field for research served as an additional stimulus.

In the meantime his aims had been gradually concentrating. History had always been a favourite study with him, and Mably's *Observations sur l'Histoire* appears to have had considerable influence in determining him to the choice of some special period for historic research. The selection, however, was not finally made without prolonged hesitation. The project of a history of Italian literature held a prominent place in his thought and found some tentative expression in his article on *Italian Narrative Poetry* (1824) and in the reply to Da Ponte's criticism (1825); but he had also in contemplation a history of the revolution which converted republican Rome into a monarchy, a series of biographical and critical sketches of eminent men, and a Spanish history from the invasion of the Arabs to the consolidation of the monarchy under Charles V. It was not till the 19th of January 1826 that he recorded in the private memoranda begun by him in 1820 his decision "to embrace the gift of the Spanish subject." The choice was certainly a bold one. On the one hand, he had no great liking for, if he had not, as he alleged, an absolute detestation of the investigation of latent and barren antiquities, while, on the other, he had not the visual power which others besides Milton have deemed indispensable to an historian. The first he might and did overcome, but the second seemed likely to prove a permanent disqualification. He could only use the eye which remained to him for brief and intermittent periods, and as travelling affected his sight prejudicially he could not anticipate any personal research amongst unpublished records and historic scenes. He was happy, however, in the possession both of ample means and admirable friends to supply so far as might be the necessary materials, and of a wide leisure in which to give them literary shape and polish; and he sketched with no undue restriction or hesitancy the plan of the *History of the Reign of Ferdinand and Isabella*—his first great work. Mr English, one of his secretaries, has furnished a picture of him at this period seated in a study lined on two sides with books and darkened by green screens and curtains of blue muslin, which required readjustment with almost every cloud that passed across the

sky. His writing apparatus—a noctograph—lay before him, and he kept his ivory style in his hand to jot down notes as the reading progressed. In accordance with his general method these notes were in turn read over to him until he had completely mastered them, when they were worked up in his memory to their final shape. So proficient did he become that he was able to retain the equivalent of sixty pages of printed matter in his memory, turning and returning them as he walked or drove. The rate of progress in preparation was therefore necessarily slow, apart from any liability to interruption by other undertakings and failures in bodily health. He still continued his yearly experimental contributions to the *North American Review*, elaborating them with a view as much to ultimate historical proficiency as to immediate literary effect, the essays on *Scottish Song* (1826), *Novel-Writing* (1827), *Molière* (1828), and Irving's *Granada* (1829) belonging to this preparatory period. The death of his eldest daughter in 1828 also led him aside to the study—afterwards renewed in the interval between the *Ferdinand and Isabella* and the *Conquest of Mexico*—of Christian evidences, with the result that he convinced himself of the fundamental truth of Christianity, though he did not accept all the tenets of orthodoxy. On the 6th of October 1829 he began the actual work of composition, which was continued without more serious interruptions than those occasioned by the essays on *Asylums for the Blind* (1830), *Poetry and Romance of the Italians* (1831), and *English Literature of the 19th Century* (1832), until 25th June 1836, when the concluding note was written. Another year, during which his essay on *Cervantes* appeared, was spent in the final revision of the *History* for the press, in which the author was ably assisted by two friends, of whom Gardiner, the son of his old schoolmaster, criticized the style and Folsom verified the facts. Its success upon its publication in Boston was immediate, the five years' contract being discharged in a few months. Arrangements were speedily made for its publication in England, and there its success was not less marked. From the position of an obscure reviewer Prescott suddenly found himself elevated to the first rank of contemporary historians. Daniel Webster spoke of him as a comet which had suddenly blazed out upon the world in full splendour, and American, British, and Continental reviewers were equally laudatory. Its reception determined the nature of all his subsequent work. Hitherto he had still inclined towards the history of literature rather than to that of polity and action, on the ground that the former was more consonant with his previous studies and a more suitable sphere for the display of his special powers. A close examination of his work in the department of literary criticism does not, however, bear out this estimate of his own genius, and the popular voice in approving his narrative faculty gave him the required impetus in the right direction. After coquetting for a short time with the project of a life of Molière he decided to follow in the track of his first work with a *History of the Conquest of Mexico*. Washington Irving, who had already made preparations to occupy the same field, generously withdrew in his favour; and in May 1838 Prescott began his first reading in the subject. The work was completed in August 1843, the five years' labour having been broken by the composition of reviews of Lockhart's *Life of Scott* (1838), Kenyon's *Poems* (1839), Chateaubriand (1839), Bancroft's *United States* (1841), Mariotti's *Italy* (1842), and Madame Calderon's *Life in Mexico* (1843), and by the preparation of an abridgment of his *Ferdinand and Isabella* in anticipation of its threatened abridgment by another hand. On 6th December 1843 the *Conquest of Mexico* was published with a success proportionate to the wide reputation won by his previous

work, the contracted number being sold off in four months and London and Paris editions meeting with a similar reception. The careful methods of work which he had adopted from the outset had borne admirable fruit. While the consultation of authorities had been no less thorough, his style had become more free and less self-conscious; and the epic qualities of the theme were such as to call forth in the highest degree his powers of picturesque narration. It was only a step from the conquest of Mexico to that of Peru, and scarcely three months elapsed before he began to break ground on the latter subject, though the actual composition was not commenced until the autumn of 1844. While the work was in progress and before the close of the year his father died,—a heavy blow to him, inasmuch as the elder and younger members of the family had continued to share the same home upon almost patriarchal terms, and the breach was therefore in a chain of constant association extending over a period of forty-eight years. In February 1845 he received the announcement of his election as corresponding member of the French Institute in place of the Spanish historian Navarrete, and also of the Royal Society of Berlin. The winter found him arranging for the publication in England of the selection from his articles and reviews which appeared in 1845 under the title of *Critical and Historical Essays*, and which was issued almost contemporaneously at New York under the title of *Biographical and Critical Miscellanies*. After some minor interruptions—his removal from the old mansion-house in Bedford Street to the house in Beacon Street, visits to friends, and a renewed failure of sight—the *Conquest of Peru* was completed in November 1846 and published in March following. His misgivings as to its reception were at once set at rest, and it was speedily issued in translations into French, Spanish, German, and Dutch, in addition to the English editions of New York, London, and Paris. He was now over fifty and his sight showed serious symptoms of enfeeblement. Although during the composition of the *Ferdinand and Isabella* it had been of very intermittent service to him, it had by his careful regimen so far improved that he could read with a certain amount of regularity during the writing of the *Conquest of Mexico*, and also, though in a less degree, during the years devoted to the *Conquest of Peru*. Now, however, the use of his remaining eye had been reduced to an hour a day, divided into portions at wide intervals, and he was driven to the conclusion that whatever plans he made for future work must be formed on the same calculations as those of a blind man. He had been for many years collecting materials for a history of Philip II., but he hesitated for some time to attempt a work of such magnitude, occupying himself in the meantime with the slighter labours of a memoir of Mr John Pickering for the Massachusetts Historical Society and the revision of Ticknor's *History of Spanish Literature*. But in March 1848 he set himself with characteristic courage to the accomplishment of the larger project, though with the intention of writing memoirs rather than a history, as admitting a more rambling style and less elaborate research. He had been fortunate in obtaining the aid of Don Pascual de Gayangos, then professor of Arabic literature at Madrid, by whose offices he was enabled to obtain material not only from the public archives of Spain but from the muniment rooms of the great Spanish families. With an exceptional range of information thus afforded him, he wrote the opening of his history at Nahant, his summer residence, in July 1849; but, finding himself still unsettled in his work, he decided in the spring of the following year to carry out a long projected visit to England. His reception there was of the most cordial and gratifying kind, and he returned re-invigorated to his work. The idea of writing memoirs

was dismissed in favour of the more elaborate form, and in November 1855 the first two volumes of his uncompleted *History of Philip II.* were issued from the press, their sale eclipsing that of any of his earlier books. This was his last great undertaking; but as Robertson's *Charles V.*, in the light of new sources of information, was inadequate to take its place as a link in the series, he republished it in an improved and extended form in December 1856. A slight attack of apoplexy on the 4th of February 1858 foretold the end, though he persevered with the preparation of the third volume of *Philip II.* for the press, and with the emendation and annotation of his *Conquest of Mexico.* On the morning of the 27th of January 1859 a second attack occurred, and he died in the afternoon of the same day in his sixty-third year.

In personal character Prescott possessed many admirable and amiable qualities, his courageous bearing and persistent labour being by no means without their heroic element, though the greater portion of his life was passed with his friends and his books. A certain habit of striving to be habitual is curiously prominent from his boyhood till his death, the desire for an objective stimulus finding expression in numberless formal resolutions and in frequent wagers with his secretaries or friends. Necessarily a valetudinarian, the smallest details of life had to be considered by him, even to the adjustment of the weight of his dress to the state of the weather and the thermometer. Yet the formalism, whether voluntary or enforced, was never obtrusive, and the final impression made upon his contemporaries was that of a frank, spontaneous, and thoroughly manly life. As an historian he stands in the direct line of literary descent from Robertson, whose influence is clearly discernible both in his method and style. But, while Robertson was in some measure the initiator of a movement, Prescott came to his task when the range of information was incomparably wider and when progress in sociologic theory had thrown innumerable convergent lights upon the progress of events. He worked, therefore, upon more assured ground; his sifting of authorities was more thorough and his method less restricted both in the selection of details and in their graphic presentation. At the same time he cannot be classed as in the highest sense a philosophic historian. His power lies chiefly in the clear grasp of fact, in selection and synthesis, in the vivid narration of incident. For extended analysis he had small liking and faculty; his critical insight is limited in range, and he confines himself almost wholly to the concrete elements of history. When he does venture upon more abstract criticism his standards are often commonplace and superficial, and the world-scheme to which he relates events is less profound than the thought of his time altogether warranted. If these things, however, indicate failure from the point of view of ideal history, they at least make for popularity. Few historians have had in a higher degree that artistic feeling in the broad arrangement of materials which ensures interest. The course of his narrative is unperplexed by doubtful or insoluble problems; no pretence at profundity or subtlety saps the vitality of his characters or interrupts the flow of incident with dissertation and digression. The painting is filled in with primary colours and with a free hand; and any sense of crudity which may be awakened by close inspection is compensated by the vigour and massive effectiveness of the whole. Though he did not bring to his work the highest scientific grasp, he brought to it scientific conscientiousness and thoroughness within his limitations, while his dominant pictorial faculty gave to his treatment a super-scientific brilliancy. The romance of history has seldom had an abler exponent, and the large number of editions and translations of his works attests their undiminished fascination at certain stages of popular culture. (R. M. W.)

PRESCRIPTION in the broadest sense of the word denotes the acquisition or extinction of rights by lapse of time. The term is derived from the *præscriptio* of Roman law, originally a matter of procedure, a clause inserted before the *formula* on behalf of either the plaintiff or, in early times, the defendant, limiting the question at issue. (See **PLEADING**.) It was so called from its preceding the *formula*.¹ One of the defendant's *præscriptiones* was *longi temporis* or *longæ possessionis præscriptio* (afterwards superseded by the *exceptio*), limiting the question to the fact of possession without interruption by the defendant for a certain time (see **POSSESSION**). It seems to have been introduced by the prætor to meet cases affecting aliens or

lands out of Italy where the *usucapio* of the civil law (the original means of curing a defect of title by lapse of time) could not apply. The time of acquisition by *usucapio* was fixed by the Twelve Tables at one year for movables and two years for immovables. *Præscriptio* thus constituted a kind of prætorian *usucapio*. In the time of Justinian *usucapio* and *præscriptio* (called also *longi temporis possessio*), as far as they affected the acquisition of ownership, differed only in name, *usucapio* being looked at from the point of view of property, *præscriptio* from the point of view of pleading. By the legislation of Justinian movables were acquired by three years' possession, immovables by ten years' possession where the parties had their domicile in the same province (*inter præsentes*), twenty years' possession where they were domiciled in different provinces (*inter absentes*). Servitudes could not be acquired by *usucapio* proper, but were said to be acquired by *quasi usucapio*, probably in the same time as sufficed to give a title to immovables. There was also a *longissimi temporis possessio* of thirty years, applicable to both movables and immovables, and requiring nothing but *bona fides* on the part of the possessor. Where the right sought to be established was claimed against the church, a still longer period of forty years (at one time a hundred) was necessary. Immemorial prescription was required in a few cases of a public character, as roads.² *Præscriptio* was also the term applied to lapse of time as barring actions upon contracts or torts under various provisions corresponding to the English Statutes of Limitation. The prescription of Roman law (and of modern systems based upon it) is thus both acquisitive and extinctive. It looks either to the length of time during which the defendant has been in possession, or to the length of time during which the plaintiff has been out of possession. In English law the latter kind of prescription is called **LIMITATION** (*q.v.*). The tendency of law is to substitute a definite for an indefinite period of prescription.

In English law prescription is used in a comparatively narrow sense. It is acquisitive only, and is very limited in its application. A title by prescription can be made only to incorporeal hereditaments—that is, in legal language, hereditaments that are or have been appendant or appurtenant to corporeal hereditaments—and to certain exemptions and privileges.³ The rights claimable by prescription for the most part consist of rights in *alieno solo*. The most important are advowsons, tithes, commons, ways, watercourses, lights, offices, dignities, franchises, pensions, annuities, and rents. Land or movables cannot be claimed by prescription. The foundation of prescription is the presumption of law that a person found in undisturbed enjoyment of a right did not come into possession by an unlawful act (see Williams, *Rights of Common*, 3). In the English courts this presumption was, perhaps it may be said still is, based upon the fiction of a lost grant, viz., that at some time in the past there had been a grant of the hereditament by a person capable of granting it to a person capable of taking it, and that the grant had been lost. The jury were instructed to find the loss of a once existing grant in whose existence no one really believed. The enjoyment of the right must have been from a time whereof the memory of man runneth not to the contrary. The period of legal memory was after a time necessarily fixed for purposes of convenience at a certain date. The date adopted varied at first with the time during which the demandant in a writ of right must have proved seisin in himself or his

² "Vise vicinales, quarum memoria non extat" (*Dig.*, xliii. 7, 3).

¹ "Præscriptiones autem appellatas esse ab eo quod ante formulas præscribuntur" (Gaius, iv. § 132).

³ Prescription seems at one time to have borne a wider meaning. A claim by prescription to land is mentioned in 32 Hen. VIII. c. 2. And it seems that tenants in common may still make title to land by prescription (Littleton's *Tenures*, § 310).

ancestors. After one or two previous enactments the date was finally fixed by the Statute of Westminster the First (3 Edw. I. c. 39) at the reign of Richard I., which was interpreted to mean the first year of the reign of Richard I. The inconvenience of this remote date, as time went on, led to the gradual growth of a rule of evidence that proof of enjoyment for twenty years was *prima facie* evidence of enjoyment from time immemorial. But evidence of the beginning of the enjoyment at however remote a date, if subsequent to 1 Ric. I., was sufficient to destroy the claim. This is still the law with respect to claims not falling within the Prescription Act, mostly rights in gross,—that is, where there is no dominant or servient tenement, *e.g.*, a right to a pew or to a several fishery in gross. The twenty years' rule was of comparatively late introduction; it does not seem to have been known in the time of Elizabeth, and was perhaps introduced in analogy to the Statute of Limitations, 21 Jac. I. c. 16. With respect to claims of profits *à prendre* and easements a change was made by the Prescription Act, 2 and 3 Will. IV. c. 71 (extended to Ireland by 21 and 22 Vict. c. 42, but not to Scotland). By that Act claims to rights of common and other profits *à prendre* are not to be defeated after thirty years' enjoyment by any person claiming right thereto without interruption for thirty years by showing only the commencement of the right, and after sixty years' enjoyment the right is absolute and indefeasible unless had by consent or agreement by deed or writing (§ 1). In claims of rights of way or other easements the periods are twenty years and forty years respectively (§ 2). The right to access and use of light is absolute and indefeasible by twenty years' enjoyment without interruption unless by consent or agreement by deed or writing (§ 3). The before-mentioned periods are to be deemed those next before suits, and nothing is to be deemed to be an interruption unless acquiesced in for one year (§ 4). In pleading, the enjoyment as of right may be alleged during the period mentioned in the Act, and without claiming in the name or right of the owner of the fee (§ 5). No presumption is to be made in favour of a right exercised for a less period (§ 6). The time during which a person otherwise capable of resisting a claim is an infant, idiot, *non compos mentis*, *feme covert*, or tenant for life, or during which an action or suit has been pending until abated by the death of a party, is to be excluded in the computation of the periods unless where the right or claim is declared to be absolute and indefeasible (§ 7). In the period of forty years a term of life or more than three years is to be excluded in case the claim be resisted by the reversioner within three years after the determination of the term (§ 8). An Act to define the period of prescription for a *modus decimandi*, or an exemption from tithes by composition, was passed the same year (2 and 3 Will. IV. c. 100; see TITHES). The Prescription Act is only supplemental to the common law, so that a claim may be based upon the Act or, in the alternative, upon the common law. Nor does the Act alter the conditions necessary at common law for a good claim by prescription. The claim under the statute must be one which may be lawfully made at common law. The principal rules upon the subject are these. (1) The title is founded upon actual usage. The amount of actual usage and the evidence necessary to prove it vary according to the kind of claim. For instance, in continuous easements (such as a watercourse) the enjoyment may go on without any active interference by the person claiming the right; in discontinuous easements (such as a right of way) the right is only enjoyed at intermittent periods. (2) The enjoyment must (except in the case of light) be as of right, a rule sometimes expressed by the words *nec vi nec clam nec precario*, derived from Roman law,—that is to say, peace-

able, openly used, and not by licence. These words bear a meaning less strict than they did in Roman law. The enjoyment in Roman law must (except in the case of *ius aquæ ducendæ*) have been *ex justo titulo* in order to found *usucapio* or *quasi usucapio*; in English law there is no doubt that enjoyment may be good by prescription, even though it began in trespass, as a footpath or a rent. (3) The prescription must be certain and reasonable. Examples of claims by prescription which have been held to be bad on this ground are a claim to take out of the land of another as much clay as is required for making bricks at a certain kiln, and a claim to a marriage fee which, though reasonable now, would have been an unreasonable amount to have been paid in the reign of Richard I., looking to the difference in the value of money. Inhabitants cannot claim by prescription, as they are an uncertain and fluctuating body, unless under a grant from the crown, which constitutes them a corporation for the purposes of the grant. (4) The prescription must be alleged in a *que estate* or in a man and his ancestors. Prescription in a *que estate* lies at common law by reason of continuous and immemorial enjoyment by the claimant, a person seised in fee, and all those whose estate he has (*tous ceux que estate il ad*). The Prescription Act fixes a definite period and does away with the necessity which existed at common law of prescribing in the name of the person seised in fee. Prescription in a man and his ancestors is not of ordinary occurrence in practice. "I am not aware of more than two cases in modern times," says Mr Joshua Williams (*Rights of Common*, 9), "where a prescription of this kind, viz., a prescription of enjoyment by a man and his ancestors, irrespective of the possession of land, has been set up." Corporations, however, occasionally claim by a prescription analogous to this, viz., in the corporation and its predecessors. Such claims by either a person or a corporation are not within the Prescription Act, which applies only where there are dominant and servient tenements. By 32 Hen. VIII. c. 2 no person can make any prescription by the seisin or possession of his ancestor unless such seisin or possession has been within threescore years next before such prescription made. (5) A prescription cannot lie for a thing which cannot be granted, as it rests upon the presumption of a lost grant. Thus a lord of a manor cannot prescribe to raise a tax or toll upon strangers, for such a claim could never have been good by any grant.

Prescription and Custom.—Prescription must be carefully distinguished from custom. Prescription, as has been said, is either in a *que estate* or in a man and his ancestors,—that is to say, it is a personal claim; custom is purely local,—that is to say, it is a usage obtaining the force of law within a particular district. In the time of Littleton the difference between prescription and custom was not fully recognized (see Littleton's *Tenures*, § 170), but the law as it exists at present had become established by the time of Sir Edward Coke. "J. S. seised of the Mannor of D. in fee prescribeth thus; That J. S. his ancestors and all those whose estate he hath in the said Mannor have time out of mind of man had and used to have Common of pasture &c. in such a place &c., being the land of some other &c. as pertaining to the said Mannor. This property we call a Prescription. A custome is in this manner; A copyholder of the Mannor of D. doth plead that within the same Mannor there is and hath been for time out of mind of man used, that all the Copyholders of the said Mannor have had and used to have Common of pasture &c. in such a waste of the Lord, parcel of the said Mannor &c." (*Coke upon Littleton*, 113b). A custom must be certain, reasonable, and exercised as of right. Like prescription at common law, it must have existed from time immemorial. On this ground a custom

to erect stalls at statute sessions for hiring servants was held to be bad, because such sessions were introduced by the Statute of Labourers, 23 Edw. III. st. 1 (*Simpson v. Wells*, *Law Reports*, 7 Queen's Bench, 214). Some rights may be claimed by custom which cannot be claimed by prescription, e.g., a right of inhabitants to dance on a village green, for such a right is not connected with the enjoyment of land. On the other hand, profits *à prendre* can be claimed by prescription but not by custom, unless in two or three exceptional cases, such as rights of copyholders to common in the lord's demesne, or to dig sand within their tenements, rights to estovers in royal forests, and rights of tin-bounders in Cornwall.

United States.—The law of the United States (except in Louisiana) is based upon that of England, but the period of enjoyment necessary to found a title by prescription varies in the different States. An easement or profit *à prendre* is acquired by twenty years' enjoyment in most States, following the English common law rule. In Michigan the term is twenty-five years, Pennsylvania twenty-one years, Connecticut and Vermont fifteen years, South Carolina five years. In Louisiana the period varies according to the subject from three to thirty years, and property other than incorporeal hereditaments may be claimed by prescription as in Roman law (see *Kent's Comm.*, vol. iii. 442). In the case of ancient lights the tendency of the decisions of many of the State courts seems to have been against the English doctrine, that a prescriptive right to light may be gained by mere enjoyment not necessarily under a claim of right (*Washburn's Law of Real Property*, vol. ii. 318).

International law uses the term "prescription" in its wider or Roman sense. "The general consent of mankind has established the principle that long and uninterrupted possession by one nation excludes the claim of every other" (Wheaton, *Int. Law*, § 165). Historic instances of rights which were at one time claimed and exercised by prescription as against other nations are the sovereignty of Venice over the Adriatic and of Great Britain over the Narrow Seas, and the right to the Sound dues long exacted by Denmark. But such claims were rejected by the highest authorities on international law (e.g., Grotius), on the ground that they were defective both in *justus titulus* and in *de facto* possession. There is no special period fixed, as in municipal law, for the acquirement of international rights by lapse of time. In private international law prescription is treated as part of the *lex fori* or law of procedure. (See LIMITATION.) (J. W.)

Scotland.—In the law of Scotland "prescription" is a term of wider meaning than in England, being used as including both *prescription* and *limitation* of English law. In its most general sense it may be described as the effect which the law attaches to the lapse of time, and it involves the idea of possession held by one person adverse to the rights of another. Though having its basis in the common law, its operation was early defined by statute, and it is now in all respects statutory. The most appropriate mode of treating the prescription of Scotch law is to regard it (1) as a mode of acquiring rights—the positive prescription; (2) as a mode of extinguishing rights—the negative prescription; (3) as a mode of limiting rights of action—the shorter prescriptions. It must, however, be observed with reference to this division that the distinction between (1) and (2) is rather an accidental (due to a loose interpretation of the language of the Act 1617, c. 12) than a logically accurate one. It is, moreover, as will immediately be seen, strictly confined to heritable rights, having no application in the case of movable property. But, though the distinction has been complained of by the highest authority as tending to create embarrassment in the law (see opinion of Lord Chancellor St Leonards in *Dougall v. Dundee Harbour Trustees*, 1852, 24 *Jurist*, 385), it is now too well settled to be departed from.

1. *Positive Prescription.*—The positive prescription was introduced by the Act 1617, c. 12,—a statute which has been described by Lord Kames as "the palladium of our land proprietors." After setting forth in the preamble the inconvenience resulting from the loss of titles and the danger of forgery after the means of improba-

tion are lost by the lapse of time, it enacts that whatever heritages the lieges, their predecessors or authors, have possessed by themselves or others in their names peaceably, in virtue of infestments for the space of forty years, continually and together, from the date of their said infestments, and without any lawful interruption during the said space, they shall not be disturbed therein, provided they produce a written title on which their possession has proceeded. Such written title must be either a charter and sasine preceding the forty years, or, when no charter is extant, instruments of sasine proceeding upon retours or precepts of *clare constat*. Though the statute in its literal construction only applied to such heritable subjects as had been conveyed by charter and sasine, it was at an early date interpreted so as to include other heritable rights, as servitudes, tacks, public rights of way, &c., where no charter could be supposed to exist. Thus forty years' possession of a road by members of the public is held to establish a right of way. And any member of the public who uses or may have occasion to use the road is considered to have a good title to plead prescription. Thus in the celebrated *Glen Tilt* case a path through *Glen Tilt* was established as a right of way in an action at the instance of three gentlemen, one of whom was a residenter in Edinburgh and another in Aberdeen (see *Torrie v. Duke of Atholl*, 1849, 12 *Dunlop's Reports*, 328; affirmed in House of Lords, 1852, 1 *Macqueen's Reports*, 65). This valuable Act of 1617 was so well framed that it continued to regulate the prescription of land rights till the year 1874. By the Conveyancing Act of that year (37 and 38 Vict. c. 94, s. 34) the period of prescription was shortened from forty years to twenty. It was provided that possessions for twenty years upon "an *ex facie* valid irredeemable title recorded in the appropriate register of sasines" should in future give the same right as forty years' possession upon charter and sasine under the earlier law. This Act of 1874 does not, however, apply to all the cases which fell under the Act of 1617. Thus it has been decided that twenty years' possession on a charter of adjudication followed by sasine and a declarator of expiry of the legal is insufficient to give an unchallengeable right, an adjudication not being an "*ex facie* irredeemable title." (*Hinton v. Connell's Trustees*, 1883, 10 *Rettie's Reports*, p. 1110). It is further specially provided by the Act of 1874 that the twenty years' prescription is not to apply to servitudes, rights of way, and public rights generally. The following rules apply to the positive prescription. (a) The possession which is required for it must be peaceable, continuous ("continually and together," as the Act of 1617 has it), and uninterrupted. (b) The prescription runs *de momento in momentum*. (c) The person against whom the prescription runs must be major and *sui juris*,—a rule which, as regards minority, was specially provided for by the Act of 1617, and as regards other cases of incapacity by the application of the principles of the common law. Under the Conveyancing Act, however, it is provided that in all cases where the twenty years' prescription applies, the lapse of thirty years is to exclude any plea on the ground of minority or want of capacity.

2. *Negative Prescription.*—This prescription was introduced by the Act 1469, c. 28, and re-enacted with some modification by 1474, c. 55. At first restricted to personal claims of debt, it was gradually extended in practice and ultimately made applicable to heritable bonds and other heritable rights by the above-mentioned Act of 1617. By the Act of 1469 it is declared that the person having interest in an obligation must follow the same within the space of forty years and take document thereupon, otherwise it shall be prescribed. The negative prescription accordingly extinguishes *in toto* the right to demand performance of an obligation after forty years, the years being reckoned from the day on which fulfilment of the obligation can be first demanded. The lapse of this period of time creates a conclusive presumption—one incapable of being redargued—that the debt or obligation has been paid or fulfilled. But it must be kept in view that the negative prescription does not *per se*—without the operation of the positive—establish a right to heritable property (*Erskine, Inst.*, b. iii. tit. 7, § 8). Thus, as has been observed, "If A has possessed for a hundred years but was not infest, any competitor who has neglected his right for that time may completely establish it, if his right was better than A's" (*per Lord Corehouse*, in *Cubbison v. Hyslop*, 183, 16 *Shaw's Reports*, p. 112). So a right of patronage has been held incapable of being lost by the negative prescription; but, on the other hand, it is settled that servitudes and public rights of way may be so extinguished. As regards the character of the prescription, it is requisite, in the same way as in the case of the positive, that the years shall have run continuously and without interruption, i.e., without any act done on the part of the creditor which indicates his intention to keep alive the right. Such interruption may, for instance, take place by the payment of interest on the debt, or citation of the debtor in an action for the debt, or by a claim being lodged in the debtor's sequestration. In the same way as in the positive, the currency of the negative prescription is suspended by the debtor being minor or *non valens agere*.

3. *Shorter Prescriptions.*—There are certain short prescriptions recognized by Scotch law—corresponding to the limitations of

English law—which operate not as extinguishing rights but as excluding the ordinary means of proving them. The following require to be noticed. (a) Vicennial prescription. By the Act 1617, c. 13, a vicennial prescription of retours was introduced, and in modern practice the same prescription is applicable to an extract decree of service which has taken the place of a retour (31 and 32 Vict. c. 101, § 37). This prescription protects a person who has been served as heir for twenty years against action by any other person claiming to be heir. By the Act 1669, c. 9, holograph missive letters and bonds in compt books also prescribe in twenty years. The debt, however, is not in this case extinguished, as within forty years it may be proved by the defender's oath. (b) Decennial prescription. By the Act 1669, c. 9, all actions by minors against their tutors and curators, and *vice versa*, must be prosecuted within ten years from the expiration of the guardianship (Erskine, *Inst.*, iii. 7, 25). (c) Septennial prescription. By the Act 1695, c. 5, it is provided that no person binding himself for and with another, conjunctly and severally, in any bond or contract for sums of money shall be bound for more than seven years after the date of the obligation. But it is necessary that the cautioner either be bound expressly as such in the bond, &c., or, if bound as co-principal, that there be either a clause of relief in the bond or in a separate back bond duly intimated (*i.e.*, notarially or in some formal way) to the creditor. This prescription does not apply to guarantees for the fulfilment of an office, or to security for a bill of exchange, or to judicial bonds. (d) Sexennial prescription. This prescription applies to bills and promissory notes, so as to deprive them of their privileges. After the lapse of six years the holder of the bill or note can no longer found on it except as an adminicle of evidence to prove his debt. This prescription was first introduced by 12 Geo. III. c. 72. (e) Quinquennial prescription applies to bargains concerning movables, such as sales of goods, loans, deposits, &c.—in short, to all mercantile transactions except such as pass into current accounts and fall under the triennial prescription noticed below. By the Act 1669, c. 9, such bargains prescribe in five years, and can thereafter only be proved by the debtor's writ or oath. The same statute also made ministers' stipends, multurets, and maills and duties prescribe in five years unless proved by writ or oath. (f) Triennial prescription. This valuable prescription was introduced so far back as the year 1579. By the Act 1579, c. 83, it was provided that "actions of debt for house maills, men's ordinaries, servants' fees, merchants' accounts, and others the like debts not founded on written obligations" shall prescribe in three years. Under the terms "like debts" have been held to fall such debts as workmen's wages, law agents' accounts, and rents due on verbal lease. All such debts must be pursued within three years, otherwise they cannot be proved except by the writ or oath of the party sued. The period from which this prescription begins to run is the date of the last item in the account. With regard to all the minor prescriptions it is to be observed generally that the respective periods of time must have run without interruption, and that, except when the contrary is expressed in the Act constituting the prescription, the years of minority and *non valentia agere* are not taken into account. (H. GO.)

PRESERVED FOOD. The perfect preservation of any substance for use as food implies the retention of its full nutritive power, sapidity, and digestibility, with its natural odour and colour unimpaired, for such length of time as may be required. The process employed must be sufficiently cheap to allow of the preserved food being placed in the market at a price which will insure a demand for it. The operations connected with the preparation of many food-substances are partly directed to the production of food in a new and more convenient form from that in which it is yielded by nature, and partly with the view of preserving the alimentary body. Cheese is an example of such a food-preparation, and to a smaller extent so also are butter and other edible fats and oils, as well as fruit and vegetable jellies and conserves. Concentrated foods and extracts, such as Liebig's extract of beef, belong to the same category, consisting of certain essential principles of animal food easily preserved, and prepared partly on that account.

Many of the most important food-staples require nothing more than favourable natural conditions for their preservation, till they are ordinarily required for consumption. Such is the case with the cereal grains, which are sufficiently ripened and dried in the harvest field, and with all hard farinaceous and oleaginous seeds, nuts, and fruits. Most soft succulent fruits and vegetables, on the other

hand, and all varieties of animal food require artificial preservation, and it is to these that the various processes in use are applied. These processes resolve themselves into four groups,—(1) drying, (2) use of antiseptics, (3) exclusion of air, and (4) refrigeration. Several hundreds of patents have been obtained in the United Kingdom alone for preservative processes coming under one or more of these heads; but in reality the methods of preservation in practical operation are not many.

1. *Drying* is the most ancient and primitive of all processes for preserving food, and, although it answers but imperfectly for most animal substances, yet in dry hot countries it is very extensively practised. In the River Plate regions of South America a large quantity of beef is annually prepared for export to Brazil and the West Indies under the name of "tasafo" or "charqui dulce," principally by drying. The meat is simply cut into pieces, freed from fat, bone, and tendon, powdered with maize meal, and dried hard by exposure to the sun, care being taken to keep it protected from rain. The dried product has about one-fourth the weight of fresh meat, and is of a dark colour. It requires to be soaked in water and cooked for a long time, yielding at best a tough indigestible meat; but it makes a well-flavoured nutritive soup. The greater part of the charqui or jerked beef of South America is, however, slightly salted as well as sun-dried; and among many races where drying is practised the use of salt and smoking are also appreciated. Many attempts have been made to introduce dried meat in the form of powder or meal. For this purpose fresh meat, deprived of fat, is cut into thin slices and slowly dried at a low heat in an oven or heated chamber till the meat is hard, crisp, and dry. When powdered, such a preparation keeps well if it is not exposed to damp; but it cannot be said to offer any advantages for general use, although it might be of value to an army during a campaign. Nevertheless a company, under the name of the Carne Pura Company, has been established in Berlin within the last few years for the manufacture of such meat-powder. Of an analogous nature are the concentrated soup tablets or cakes, prepared, principally in Russia, by the rapid evaporation of rich soups, with which dried vegetables and flour are sometimes incorporated in proportion sufficient to yield a good soup on dilution with boiling water. These soups are generally deficient in aroma and have frequently an unpleasant gluey consistency and taste. Concentrated meat biscuits, in which flour and extract of beef are prepared in a thoroughly dry condition, and which were largely used in the American Civil War, the German pea sausage ("Erbsenwurst"), made famous during the Franco-Prussian War, and pemmican are examples of food in which dried meat may be well preserved in conjunction with farinaceous substances. Preservation by simple drying is extensively practised among the Chinese for their gelatinous foods, such as trepang, dried tendons, skins, mussels and other molluscs, and fish. Milk also may be preserved in the form of a dry powder, but the result is not sufficiently attractive to command a market.

Succulent fruits and vegetables are satisfactorily preserved by simple drying. The principal dried saccharine fruits of commerce are raisins, currants, figs, dates, and prunes. These differ in their nutritive properties considerably from the natural fruits they represent, as do also the farinaceous fruits and vegetables preserved by drying, such as the banana, bread-fruit, mandioc, &c. A process of drying and compressing ordinary pot-vegetables and potatoes, invented by M. Masson about 1845, is now carried out on a large scale by Messrs Chollet & Co. of Paris. The vegetables to be treated are carefully picked, plunged into boiling water to coagulate the vegetable al-

bumen, shred, and promptly dried in a current of heated air. They are then submitted to powerful hydraulic pressure, condensing them into thin dense cakes, which retain from 9 to 15 per cent. of the weight of the original green substances, or 20 per cent. of the weight in the case of potatoes, but all in greatly reduced compass. The saving of space is, equally with the preservation, of the utmost importance for use on board ship or by soldiers in the field. Within the space of a cubic metre 25,000 rations of Chollet's compressed vegetables can be packed, each ration weighing 25 grammes and representing about 200 grammes of green vegetables. As anti-scorbutics such preserved vegetables are inferior; but they are nevertheless exceedingly useful, and when well cooked almost equal in taste to the fresh vegetables.

2. *Use of Antiseptics.*—The variety of antiseptic substances which have been experimented with for the curing of food is numberless. Bodies solid, liquid, and gaseous have been proposed, and these have been variously recommended for superficial application, for injection, and for forming an artificial atmosphere around the substance to be preserved; and further, it has been suggested that the creature whose flesh is to be preserved should, before killing, be impregnated with the antiseptic by inhalation or otherwise. In practice the antiseptics used are very few in number, since many of them have a physiological effect on the digestive and other internal organs into which they are introduced with the food, and so must injure the health. Besides, many proposed antiseptics are either in themselves unpleasant in smell or taste, or alter the appearance, colour, taste, or consistency of the food preserved. The least objectionable are substances which enter into human food themselves, such as certain salts, sugar, vinegar, and alcohol. The most ancient, most commonly used, and throughout most effective is common salt. Salt acts on meat by withdrawing the animal juices, the place of which it takes, and by hardening the muscular tissue. Consequently it seriously lessens the nutritive value of animal food, and renders it much less digestible than fresh meat. It appears to be least injurious in the case of pork, the fat of which it renders more digestible, and, as a consequence, no animal food is more largely preserved by the process of salting. A certain proportion of other saline bodies, notably saltpetre (nitrate of potash), and of sugar is frequently combined with salt in curing, and so also are other antiseptic and preservative agencies. Bacon, for example, is both salted and smoked, while tongues and fish are not only salted and smoked but also dried. Smoking alone is very effective in preserving and flavouring fish intended for consumption within a limited time after curing. The quantity of fish prepared for human food by salting, smoking, and drying, together or separately, is incalculably great. Of other antiseptics which have been suggested, and which may be used effectively for the preservation of food, few possess any advantage whatever over common salt, which is certain in its action, abundant, cheap, and, within limits, harmless. Among the substances which have of recent years come into prominent notice are bisulphite of lime and various preparations of boracic acid, notably that known as "glacialin" salt and the boro-glycerin introduced by Professor Barff. Boracic acid is a powerful, inodorous, and tasteless preservative; but in repeated small doses it exercises a specific influence on the excretory organs which must be detrimental to health. Salicylic acid has also been extensively tried as a food-preserver, more especially for milk, but, in addition to the unpleasant taste it communicates to the substances, there are physiological objections to its use.

The use of non-saline preservative agents is exemplified on a large scale in the pickling in vinegar of succulent fruits

and vegetables (see PICKLES, p. 80 above). Sugar plays a similar part in the preparation of jams, jellies, candied fruits, &c., and alcohol is also occasionally employed as a medium for the preservation of fruits. Oil acts as a preservative more by its power of excluding atmospheric air than from any antiseptic influence it possesses, and therefore comes under the next category.

3. *Exclusion of Air.*—The principal method of food preservation dependent on the exclusion of air is the invention of François Appert and dates from 1809. It consists essentially in securing cooked food in hermetically sealed vessels from which the atmospheric air is as far as possible driven off before sealing, and in killing by heat or otherwise such germs or ferments as may remain within the vessel either before or after it is sealed up. The process does not depend for its success on the perfect exclusion of air,—indeed, originally there was no attempt to drive it off, but air sealed up with the food was immediately submitted to a temperature sufficiently high to kill all germs introduced with it and existing in the food itself. Quite recently experiments have been conducted by Mr J. J. Coleman, the inventor of the cold-air process described below, with the view of preserving food in hermetically sealed vessels, which, instead of being exposed to heat, are subjected to an intense cold, supposed to be sufficient to kill all minute putrefactive organisms; but he has found that a cold of 130° Fahr. below freezing-point is insufficient to destroy all organic germs. At present the innumerable varieties of tinned foods, both animal and vegetable, are entirely the result of the application of Appert's principle. In practice there are several processes of "tinning" food, but the general method adopted is everywhere uniform in principle.

The tins used are manufactured with the greatest care, and most ingenious machinery has been devised for their thorough and expeditious preparation. The proper quantity of meat, generally, though not necessarily, free from bone, tendon, and undue proportion of fat, is weighed out and placed raw in the tin, over which the cover is soldered. In the cover a small "pin-hole" is left, and the tins are placed in a bath or boiler of solution of chloride of calcium, which boils at a temperature of from 260° to 270° Fahr. Each tin is immersed to within an inch or two of the top, and as the heat is gradually raised steam issues from the pin-hole, carrying off the atmospheric air from within the tin. When all the air has been expelled the pin-hole is promptly closed with a drop of solder, and the tin, hermetically sealed, is entirely immersed for some time in the superheated solution. When withdrawn and cooled, the tins are placed in a heated testing-house, in which after a few days those that have been imperfectly treated manifest their defects by a bulging of the sides, due to the generation of gases from the putrefying mass they contain. Those which have been successfully preserved generally show both ends collapsed or depressed by the pressure of the air outside; and usually on a well-preserved tin being pierced the air is audibly sucked in.

The process is applicable to all classes of food, vegetable as well as animal, which may without destruction be submitted to a temperature sufficient to render putrefactive organisms inert, and in experience the amount of heat to which different substances must be exposed varies very considerably. The variety of substances preserved by tinning is now very great, and the total weight of human food so stored is enormous. Numerous modifications of the air-exclusion principle, effectual within certain limits, are in use. The preservation of sardines is due partly to cooking them in oil and surrounding them with it and partly to sealing them in tins, and potted meats, the "conserves fines" of the French, are partly preserved by the use of fat. The most effective means of preserving eggs consists in coating the shells, as soon as they are laid, with butter or some other fat, gum, or varnish. Such coating prevents the transfusion of water from the egg which ordinarily goes on, the place of the water being taken by atmospheric air, rendering the egg specifically lighter and promoting its putrefactive change. Processes for the exclusion of air

by the substitution of an atmosphere of some inert gas have not proved successful, neither has the method proposed and patented by Dr Redwood, which consisted in coating meat with a layer of paraffin.

4. *Refrigeration.*—That cold checks putrefaction has long been known from ordinary experience. Bodies of the prehistoric mammoth have been found in the ice of the Siberian tundra so well preserved that the flesh was eaten by dogs. Ice is much used by fish merchants and other provision dealers for the temporary preservation of their perishable stores; but the cost and inconvenience of the process in temperate, and still more in hot, climates render it applicable only for brief spaces of time and to the more costly of food-products. But about the year 1875 ice began to be used on a large scale for the preservation of fresh meat during its transit from America to the European markets. This, the first practically successful method of preserving fresh meat for such a period as enabled it to be sold in remote markets, consisted in cooling a large meat chamber hung full of carcasses by continually blowing into it air which had previously been cooled to near the freezing point by being made to pass through reservoirs of ice. The process was not all that could be desired, but it successfully solved a question which had previously been attempted many times and ways. It continued to be the method by which large quantities of fresh meat were brought in good condition to the European market, till in 1879 Mr J. J. Coleman inaugurated a new era by the introduction, in conjunction with Mr H. Bell and Mr J. Bell, of his Bell-Coleman dry-air refrigerator.

In the Bell-Coleman machine atmospheric air is compressed to one-fourth or one-third of its normal bulk in an air-pump by means of a steam cylinder. The air so condensed becomes hot, and is cooled by injecting water into the air-compressor, after which it is still further reduced in temperature and freed from moisture by passing it through a range of pipes in the cold air of the chamber that is being refrigerated. Being then conveyed to the expanding cylinder, the work or energy it contains in virtue of its compression is expended in moving a piston which forms part of the machinery. From the piston the air, now cooled as much as 50° to 100°, or even 200° Fahr., according to the degree of compression to which it has been subjected, is distributed through the cold chamber by suitable pipes. Mr A. Seale Haslam has since brought out a refrigerator in which the temperature of the air is lowered by passing it through pipes cooled externally, instead of by injecting water into the tubes containing it.

Numerous other machines have also been produced, the principle and action of which are illustrated in the article ICE, vol. xii. p. 612. By means first of the Bell-Coleman and subsequently of the Haslam method, fresh meat has been regularly imported into Europe from America since March 1879, when the Anchor liner "Circassia" delivered the first cargo. In February 1880 the first shipment from Australia, consisting of 34 tons of beef and mutton, was delivered in London by the "Strathleven," and in June 1882 the sailing ship "Dunedin" brought from New Zealand to London, after a passage of ninety-eight days, 4909 carcasses of sheep and twenty-two pigs, all in perfect condition, notwithstanding the prolonged voyage and the excessive heat encountered during the passage. The dry-air refrigerators have also been largely adopted in passenger and emigrant vessels for preserving fresh provisions for daily use throughout their voyages, and preserving chambers and freezing chambers have been erected on land at the ports of lading and delivery. The machinery at present in use is capable of freezing upwards of 300,000 tons of meat per annum, and it is rapidly being added to; and it may be said that these machines have accomplished a perfect solution of the great problem of fresh-meat preservation and distribution.

Commerce.—It is impossible to tabulate any reliable figures relating to the trade in products which are properly classed as

preserved food. Within the first five years in which the Bell-Coleman machine was in use there were brought from America by its agency alone 563,568 quarters of beef and 113,633 carcasses of mutton. The following figures illustrate the development of the frozen-mutton trade from the great sheep-growing localities, giving the number of carcasses imported.

	1881.	1882.	1883.	1884.
New Zealand	8,840	98,754	398,859
Australia ..	13,771	55,087	60,717	107,437
River Plate	54,369

As these imports bear only an insignificant relation to the supplies which might be drawn from the several countries at the present moment, it is obvious that a most important factor has been introduced into the meat trade which will exercise a powerful influence on the markets.

(J. PA.)

PRESSBURG (Hung. *Pozsony*, Lat. *Posonium*), capital of the county of the same name and in former times also of the country, is a royal free town in Hungary, situated on the left bank of the Danube, in 48° 8' N. lat. and 17° 6' E. long. Pressburg is the see of an evangelical bishop, and the headquarters of one of the fifteen army-corps of the Austrian-Hungarian army and of a honved district; its civil departments include finance, posts, land-surveying, state forestry, public instruction, river regulation, and Government buildings; it has also a district court of justice, a superior law court, and a chamber of trade and commerce. Among its numerous educational and benevolent institutions the following are specially worthy of mention—the academy of jurisprudence and philosophy, a Roman Catholic upper gymnasium, an evangelical lyceum, an evangelical seminary, an upper real school, a Government training school for governesses and another of midwifery, schools of music and drawing, two free libraries, a lazaretto, a lunatic asylum, six hospitals, two workhouses, two public kitchens, &c. The most prominent buildings are—a fine cathedral, dating from the 11th century (in which many of the Hungarian kings were crowned), twelve other Roman Catholic churches, two evangelical churches, two synagogues, the ancient town-hall, the parliament house (which served for this purpose until 1848), the now uninhabited palace of the archbishop of Esztergom (Gran), a number of palaces of nobles, and the theatre. On the Schlossberg there stood a royal castle (destroyed by fire in 1811), which was a strong fortress during the wars with the Turks. The inhabitants in 1881 numbered 48,326, of whom 8000 were Protestants, 5000 Jews, and the rest Roman Catholics; as to nationality, 30,000 were Germans, 9000 Slavs, and the rest (chiefly the upper classes) Hungarians. The inhabited houses numbered 2015. The town has five newspapers (three in Hungarian and two in German). A large business is carried on in tobacco and cigars, paper, ribbons, leather wares, chemicals, liqueurs, confectionery, biscuits, &c. There is also a good trade in corn and wine. The Danube, here of considerable width, is crossed by a pontoon bridge. There is a large traffic by water with both Vienna and Budapest. Pressburg is the terminus of the Vale of Vág Railway and is also one of the most important stations on the Austrian-Hungarian State Railway system. Although one of the finest towns in the country, its chief charm is its vicinity, which is of singular beauty. Eastwards and southwards stretches a long fertile plain, whilst to the north and west the town is enclosed by the lovely hills of the Little Carpathian range.

Little is known of the early history of Pressburg. The name does not occur before the 9th century. In 1042 it was destroyed by the Germans, but was soon afterwards rebuilt and so strongly fortified that it sustained two other attacks and was not taken again until 1271. From its strategic situation it has always been an important place. When in 1541 Buda was taken by the Turks, Pressburg became the Hungarian capital, place of coronation, and seat of all the Government offices, and it remained so a good while after the Turks were driven from the country. It was here that the Austrian

and Hungarian malcontents concluded the treaty with Archduke Matthias against Rudolf II. In 1619 Pressburg was taken by the Protestant leader Bethlen Gabor; but it was recovered by the imperialists in 1621. It was also the scene of that memorable session of parliament, 1687, at which the Hungarians renounced their right of choosing their king and accepted the hereditary succession. In 1784 the capital was removed to Buda. Peace was made here between Napoleon and Francis I. after the battle of Austerlitz, 26th December 1805, and in 1809 Davoust bombarded the place for a whole month. It continued to be the seat of parliament until 1848, and it was the scene of the great reform debates during the session of 1847-48.

PRESS LAWS. The liberty of the press has always been regarded by modern political writers as a matter of supreme importance. "Give me liberty to know, to utter, and to argue freely according to conscience, above all other liberties," says Milton in the *Areopagitica*. At the present day the liberty of the press in English-speaking countries is (with perhaps the single exception of Ireland) a matter of merely historical importance. The liberty was a plant of slow growth. Before the invention of printing the church assumed to control the expression of all opinion distasteful to her. (See BIBLIOGRAPHY, vol. iii. pp. 658, 659, INDEX LIBRORUM PROHIBITORUM, INQUISITION.) The authority of parliament was invoked in England to aid the ecclesiastical authority. There is an ordinance as early as 1382, 5 Ric. II. st. 2, c. 5 (not assented to by the Commons, but appearing upon the parliament roll), directed against unlicensed preachers. After the invention of printing the ecclesiastical censorship was still asserted, but only as collateral with the censorial rights of the crown, claimed by virtue of its general prerogative. After the Reformation the greater part of the rights of censorship passed to the crown, which at the same time assumed the power of granting by letters patent the right of printing or selling books as a monopoly. The grant, if made to the author himself, was an equivalent of copyright; if made to a person other than the author, it seems to have always been subject to the author's copyright as it existed at common law.

Censorship was either restrictive or corrective, i.e., it interfered to restrict or prevent publication, or it enforced penalties after publication. Repression of free discussion was regarded as so necessary a part of government that Sir Thomas More in his *Utopia* makes it punishable with death for a private individual to criticize the conduct of the ruling power. Under Mary printing was confined to members of the Stationers' Company, founded by royal charter in 1556. Under Elizabeth the Star Chamber, the great censorial authority of the Tudor period, assumed the right to confine printing to London, Oxford, and Cambridge, to limit the number of printers and presses, to prohibit all publications issued without proper licence, and to enter houses to search for unlicensed presses and publications (Order of 1585, Strype's *Whitgift*, App. 94). The search for unlicensed presses or publications was entrusted to an officer called the "messenger of the press." The Stuart kings followed the example of their predecessors. Thus in 1637 was issued a stringent order of the Star Chamber forbidding the importation of books printed abroad to the scandal of religion or the church or the Government, and the printing of any book not first lawfully licensed. Law books were to be licensed by one of the chief justices or the chief baron, books of history and state affairs by one of the secretaries of state, of heraldry by the earl marshal, of divinity, philosophy, poetry, and other subjects by the archbishop of Canterbury or the bishop of London, or the chancellors or vice-chancellors of the universities. There were to be only twenty master printers and four letter-founders. The punishment was at the discretion of the court (Rushworth, *Historical Collections*, vol. iii., App. 306). The same principle of press restriction was carried out by the Long Parliament

after the abolition of the Star Chamber, and it was an ordinance of that body issued in 1643 that called forth Milton's *Areopagitica*, a *Speech for the Liberty of Unlicensed Printing*, itself an unlicensed book. The parliament appointed committees for printing, who appointed licensers, but the licensing was really left in a great measure to the wardens of the Stationers' Company. At the Restoration Sir John Birkenhead acted as licenser, appointed apparently under the general prerogative. It was, no doubt, too, under the general prerogative that Charles II., by a proclamation in 1660, called in and suppressed Milton's *Defensio pro Populo Anglicano*. Then followed the Licensing Act of 1662 (13 and 14 Car. II. c. 33), limited to two years. The provisions as to importation of books, the appointment of licensers, and the number of printers and founders were practically re-enactments of the similar provisions in the Star Chamber order of 1637. Printing presses were not to be set up without notice to the Stationers' Company. A king's messenger had power by warrant of the king or a secretary of state to enter and search for unlicensed presses and printing. Severe penalties by fine and imprisonment were denounced against offenders. The Act was successively renewed up to 1679. Under the powers of the Act Sir Roger L'Estrange was appointed licenser, and the effect of the supervision was that practically the newspaper press was reduced to the *London Gazette*. (See NEWSPAPERS, vol. xvii. pp. 414, 415.) The objections made to lines 594-599 of the first book of *Paradise Lost* by the archbishop of Canterbury's chaplain, acting as licenser, are well known. The Act expired in 1679, and for the remainder of the reign of Charles II., as in the reign of George III., the restrictions on the press took the form of prosecutions for libel. The twelve judges resolved in 1680 "that all persons that do write or print or sell any pamphlet that is either scandalous to public or private persons, such books may be seized and the person punished by law; that all books which are scandalous to the Government may be seized, and all persons so exposing them may be punished. And further, that all writers of news, though not scandalous, seditious, nor reflective upon the Government or the state, yet, if they are writers (as there are few else) of false news, they are indictable and punishable upon that account" (Harris's case, *State Trials*, vii. 929). In 1685 the Licensing Act was renewed for seven years (1 Jac. II. c. 8, § 15). No mention of the liberty of the press was made in the Bill of Rights. On the expiration of the Licensing Act in 1692 it was continued till the end of the existing session of parliament (4 and 5 Will. and Mary, c. 24, § 14). In 1695 the Commons refused to renew it. The immediate effect of this was to lay authors open to the attacks of literary piracy, and in 1709 the first Copyright Act (8 Anne, c. 19) was enacted for their protection. The power of a secretary of state to issue a warrant, whether general or special, for the purpose of searching for and seizing the author of a libel or the libellous papers themselves—a power exercised by the Star Chamber and confirmed by the Licensing Act—was still asserted, and was not finally declared illegal until the case of *Entick v. Carrington* in 1765 (*State Trials*, xix. 1030). In 1776 the House of Commons came to a resolution in accordance with this decision. The compulsory stamp duty on newspapers was abandoned in 1855 (18 Vict. c. 27), the duty on paper in 1861 (24 Vict. c. 20), the optional duty on newspapers in 1870 (33 and 34 Vict. c. 38). From that time the English press may be said to date its complete freedom, which rests rather upon a constitutional than a legal foundation. It is not confirmed by any provision of the supreme legislative authority, as is the case in many countries. A declaration in favour of the liberty of the press is usually a prominent feature in the written

constitutions of foreign states. Its legal aspect in England cannot be better expressed than in the words of Lord Wynford:—

"My opinion of the liberty of the press is that every man ought to be permitted to instruct his fellow-subjects; that every man may fearlessly advance any new doctrines, provided he does so with proper respect to the religion¹ and government of the country; that he may point out errors in the measures of public men, but he must not impute criminal conduct to them. The liberty of the press cannot be carried to this extent without violating another equally sacred right, the right of character. This right can only be attacked in a court of justice, where the party attacked has a fair opportunity of defending himself. Where vituperation begins, the liberty of the press ends" (*Rex v. Burdett*, *Barnewall and Alderson's Reports*, iv. 132).

The few existing restrictions on the liberty of the press are presumed to be imposed for the public benefit. They are in some cases of great historical interest. The rights of private persons are in general sufficiently protected in one direction by the law of LIBEL (*q.v.*), in another by the law of COPYRIGHT (*q.v.*), while the criminal law provides for the cases of press offences against morality, public justice, &c. Thus the courts have power to punish summarily as a contempt the publication of comments upon proceedings *sub judice* or reflexions upon the conduct of judicial officers. (See CONTEMPT OF COURT.) The last relic of the censorship before publication is to be found in the licensing of stage plays. By 6 and 7 Vict. c. 68 no new plays or additions to old plays can be acted for hire at any theatre in Great Britain until they have been submitted to the lord chamberlain, who may forbid any play or any part of a play. The penalty for acting a play before it has been allowed or after it has been disallowed is a sum not exceeding £50 for every offence and the forfeiture of the licence of the theatre in which the offence occurred. This jurisdiction is exercised by an official of the lord chamberlain's department called the "examiner of stage plays." The last relic of the monopoly of printing formerly granted to licensees of the crown is found in the exclusive right of the queen's printer and the universities of Oxford and Cambridge to print the Bible² and the Book of Common Prayer, and of the queen's printer to print Acts of parliament and other state documents. The privileges of the universities are confirmed by 13 Eliz. c. 29. The rights of the queen's printer are protected by severe penalties. A maximum term of seven years' penal servitude is incurred by any person who prints any Act of parliament or other Government document, falsely purporting to be printed by the queen's printer or under the authority of Her Majesty's stationery office (8 and 9 Vict. c. 113; 45 Vict. c. 9). The rights of the printers of the journals of either House of parliament are protected by 8 and 9 Vict. c. 113. The publication of parliamentary debates in any form by any other persons than the printers of the journals of the two Houses is still in theory a breach of privilege, but in practice they have been fully reported since 1771. The other restrictions upon the press are to a great extent those imposed for police purposes. By 32 and 33 Vict. c. 24 (confirming in part previous enactments applying to Great Britain) the printer of any paper or book for profit is required under penalties to print thereon his name and address or the name of a university press, and is to keep a copy of everything printed, with a few exceptions. Penalties must be sued for within three months, and no proceeding for penalties can be commenced

unless in the name of the attorney-general or solicitor-general of England or the lord advocate of Scotland. By the Newspaper Libel and Registration Act, 1881 (44 and 45 Vict. c. 60, which applies to England and Ireland, but not to Scotland), newspaper proprietors are, except in the case of joint-stock companies, to be registered and to make annual returns of the title of the newspaper and the names of all the proprietors, with their occupations, places of business, and places of residence. By the Corrupt Practices Prevention Acts, 1883 and 1884 (46 and 47 Vict. c. 51, s. 18, and 47 and 48 Vict. c. 70, s. 14), the name and address of the printer must be printed on all bills, placards, &c., referring to a parliamentary or municipal election. By 6 and 7 Vict. c. 68, s. 7, the name and place of abode of a manager of a theatre are to be printed on every play-bill announcing a representation at such theatre. Offences against decency by the press are provided for by 20 and 21 Vict. c. 83, 25 and 26 Vict. c. 101, s. 251 (for Scotland), and 2 and 3 Vict. c. 47, s. 54 (for the metropolis). The importation of obscene literature into the United Kingdom is forbidden by 39 and 40 Vict. c. 36, s. 42. By the Larceny Act, 1861, any person who prints or publishes an advertisement offering a reward for the return of stolen goods without questions asked is subject to a penalty (24 and 25 Vict. c. 96, s. 102). This penalty cannot, however, be sued for without the sanction of the attorney-general or solicitor-general of England or Ireland (33 and 34 Vict. c. 65). The advertisement in the United Kingdom of foreign or illegal lotteries is prohibited by 6 and 7 Will. IV. c. 66, betting advertisements by 16 and 17 Vict. c. 119, s. 7, and 37 Vict. c. 15.

The right of an author or publisher to the full profits of his undertaking was at one time restricted by the Copyright Act of Anne (8 Anne, c. 19, s. 4), by which the archbishop of Canterbury and other authorities were empowered to lower the price of a book upon complaint that the price was unreasonable. The only restriction of the kind now existing is the obligation of delivering (without request) to the British Museum a copy of any work published within the United Kingdom, and of delivering (on request) copies for the use of the university libraries at Oxford and Cambridge, the library of the faculty of advocates at Edinburgh, and the library of Trinity College, Dublin (5 and 6 Vict. c. 45, ss. 6-10).

Scotland.—Printing became, as in England, a royal monopoly. The exclusive right of printing was granted by James IV. to Walter Chepman, who printed the first book in Scotland. The monopoly of printing Acts of the Scottish parliament was granted by James V. to the printer chosen by the clerk register and specially licensed by the king (1540, c. 127). Printers are forbidden by 1551, c. 27, to print, whether in Latin or English, without licence from ordinaries deputed in that behalf by the crown. No book treating of religion or of the kirk was to be printed without a licence from the general assembly (1646, c. 164), or of the kingdom without a licence from one of the judges or the secretary (c. 165). The council were empowered to prohibit presses at their discretion by the order of 30th March 1655. The importation of "famous" books and libels in defence of the pope was prohibited by 1581, c. 106. Press offences were treated with the utmost severity. By 1585, c. 1, the author of a libellous writing against the king was punishable with death. It is scarcely necessary to say that since the Union the press of Scotland has enjoyed no less liberty than that of England.

In the case of Bibles, Old and New Testaments, Psalm Books, the Book of Common Prayer, the Confession of Faith, and the Larger and Shorter Catechisms a licence for printing is still required. The licensing authority is

¹ This is to be read subject to the remark of Lord Coleridge that the application of the principles of law is to be changed with the changing circumstances of the time (*Reg. v. Ramsay*, in *Cox's Criminal Cases*, xv. 285). What was blasphemous in law a hundred years ago is not necessarily so now.

² The monopoly of the queen's printer does not extend to any translation other than the authorized version, and not to that if it be accompanied by new notes or marginal readings.

the lord advocate, but all proposed publications are submitted for approval to the body officially known as "Her Majesty's sole and only Master Printers in Scotland," consisting of the lord advocate, the solicitor-general, the moderator of the general assembly, and four other members. A licence is also required for printing Acts of parliament; but a general licence granted in 1848 to a firm of printers in Edinburgh is still operative, and their publications are not submitted for approval. As its work is practically confined to Bibles and the other religious publications enumerated, the above-mentioned body commonly receives the name of the Bible Board.

Ireland.—This is the only part of the United Kingdom in which the press cannot be said to be free. The policy of successive Governments has generally been in favour of restrictions. By the Prevention of Crime Act, 1882 (45 and 46 Vict. c. 25), the lord-lieutenant was empowered to order the seizure of any newspaper appearing to contain matter inciting to the commission of treason or of any act of violence or intimidation (§ 13). He may also by warrant direct the search for and seizure of any papers or documents suspected to be used or to be intended to be used for the purpose of or in connexion with any secret society existing for criminal purposes (§ 14).

United States.

The constitutions of Pennsylvania, Delaware, Maryland, and North Carolina, all enacted in 1776, are interesting as containing the earliest declarations of any legislative authority in favour of the liberty of the press. The same principle was afterwards adopted in the constitution of the United States. By art. i. of the amended constitution, "Congress shall make no law . . . abridging the freedom of speech or of the press." Art. iv. secures against warrants for the seizure of papers, except on probable cause supported by oath or affirmation and particularly describing the thing to be seized. The constitution of Louisiana is that in which the right of liberty of the press is declared with the greatest minuteness. By art. vi. s. 21 of the constitution of that State, "Printing presses shall be free to every person who undertakes to examine the proceedings of the legislature or any branch of the government, and no law shall ever be made to restrain the right thereof. The free communication of thoughts and opinions is one of the invaluable rights of man, and every citizen may freely speak, write, and print on any subject, being responsible for the abuse of that liberty." The Acts of Congress dealing with the press are not numerous, as each State has for the most part its own legislation on the subject, dealing generally with, among other matters, the registration of newspapers, the monopoly of the State printer, and the right of giving the truth in evidence in defence to proceedings for libel. The Act of 18th August 1856 forbids diplomatic or consular officers of the United States to correspond with any foreign newspaper in regard to the affairs of a foreign state. The Act of 3d March 1873 prohibits the printing and circulation of obscene literature. By the Act of 23d June 1860 the congressional printer has, except where otherwise provided by law, the monopoly of printing for the Senate or House of Representatives and the executive and judicial departments. State prosecutions for seditious libel were not infrequent in the early years of the republic; examples will be found in Wharton's *State Trials*.

Press Laws in the British Colonies and India.

Colonies.—In the British colonies the press is as free as it is in England. Each colony has its special legislation on the subject for police and revenue purposes. Where there is a Government printer, his monopoly is protected by the Documentary Evidence Act, 1868 (31 and 32 Vict. c. 87), which imposes a maximum

penalty of five years' penal servitude upon any person printing a copy of any proclamation, order, or regulation which falsely purports to have been printed by the Government printer, or to be printed under the authority of the legislature of any British colony or possession. The Act is, however, subject to any law made by the colonial legislature.

India.—During the governor-generalship of Lord Lytton was passed the "Act for the better control of publications in Oriental languages," Act ix. of 1878. (1) By this Act copies of newspapers published out of British India are liable to forfeiture and seizure by warrant throughout the whole of British India if the papers "contain any words, signs, or visible representations likely to excite disaffection to the Government established by law in British India, or antipathy between any persons of different races, castes, religions, or sects in British India." The governor-general may, by notification in the *Gazette of India*, exclude newspapers, books, &c., from British India. (2) In places to which the Act is extended by order of the governor-general in council, a magistrate may require the printer and publisher of a newspaper to enter into a bond, with a deposit, not to publish a newspaper containing "any words, signs," &c. (as in 1), or to use or attempt to use it for the purpose of extortion or threat. The consequences of offending are forfeiture of the deposit, papers, press, &c. Books used for the illegal purposes above-mentioned are subject to forfeiture, but no bond or deposit is required previous to publication of books, as in the case of newspapers.

Foreign Press Laws.

Liberty of the press is the rule in most European states. This liberty is in almost every case secured by a constitution or organic law, the earliest being those of Sweden and Spain in 1812. In some states there is a tax upon newspapers and advertisements; in others, as in Sweden and Norway, there is none. In most states there is a Government official newspaper, and a Government printer, enjoying peculiar privileges.¹

Austria-Hungary.—Restraints upon the press were formerly very stringent, especially in the Italian provinces. Severe penalties against unlicensed printing were denounced by the penal code of 1808. For a second offence the offender was forbidden to deal in books. Private printing presses were forbidden under a fine of 500 florins. Inciting to emigration was one of the most remarkable press offences contained in this code. Two censors of the press were appointed in 1810. Booksellers were put under police supervision in Hungary in 1847. In 1848 the press became free for a time, until a restrictive law was again imposed in 1852. Strict censorship ceased in 1863. By the fundamental law concerning the rights of citizens, 21st December 1867, art. 13, every one has the right of freely expressing his thoughts by the press within the limits imposed by law. The press cannot be controlled by censorship, or restrained by the system of authorization. Administrative and postal interdiction is never to extend to matters printed in the realm. By the law of the same date on judicial authority, art. 11, press offences are to be tried by jury. The constitution of 1867 (on the basis of that proposed in 1848) secures liberty of the press in Hungary.

Belgium.—It was the prosecution of political writers by the Dutch Government that directly led to the independence of Belgium in 1830. By the Belgian constitution of 7th February 1831, art. 18, it is declared that the press is free, that censorship shall never again be established, that sureties cannot be exacted from writers, editors, or printers, and that when the author is known and domiciled in Belgium the printer or bookseller cannot be prosecuted. By art. 98 press offences are to be tried by jury. The penal law of the press is contained in the decree of 20th July 1831, made perpetual in 1833. By this law it is made an offence, apart from the penal code, (1) to incite to the commission of a crime by placards or printed writings in a public meeting; (2) to attack the obligatory force of the laws, or to incite to disobedience of them; (3) to attack the constitutional authority or inviolability of the king, the constitutional authority of the dynasty, or the authority and rights of the chambers. Every copy of a journal must bear the name of the printer and the indication of his domicile in Belgium. Proceedings for offences against the law must be taken in some cases within three months, in others within a year.

Brazil.—By art. 179 of the constitution of 1824 every one is entitled to express his thoughts by words and writings and publish them in print without liability to censure, but he is answerable for abuses committed in the exercise of this right.

(In most, if not all, of the Central and South American republics liberty of the press is one of the rights secured by the constitution. Thus in Chili it is secured by the constitution of 1833, in the Argentine Republic by that of 1860.)

Denmark.—Press offences were at one time punished with great severity. By the code of Christian V. (1683) libel was punished with infamy and hard labour for life, and, if against a magistrate,

¹ The writer wishes to take this opportunity of acknowledging the assistance rendered him by representatives of several foreign Governments.

with death. Censorship was abolished and the press declared free by art. 86 of the constitution granted by Frederick VII. on 5th June 1849, and confirmed by Christian IX. in 1866. Art. 81 forbids the search for or seizure of printed matter in a dwelling-house, unless after judicial proceedings.

France.—The Government began early to impose stringent restrictions upon printing. An edict of Henry II. in 1559 made it punishable with death to print without authority. The university of Paris originally claimed the right of licensing new theological works, a jurisdiction vested in the crown by an ordinance of 1566. Offences against religion were severely punished by the secular authorities. Thus the parliament of Toulouse sent Vanini to the stake in 1619 for the crime of publishing a heretical work. A few years later, in 1626, Cardinal Richelieu declared it a capital offence to publish a work against religion or the state. In 1723 appeared a regulation forbidding any but licensed booksellers to deal in books. Many later regulations were directed against unlicensed presses, the employment of more than a certain number of workmen, &c. At the Revolution all these restrictions were abolished, and the assembly declared it to be the right of every citizen to print and publish his opinions. This new liberty quickly needed a check, which was attempted as early as 1791, but no effectual restraint was imposed until the law of 5th February 1810 established a direction of the press. The charter of Louis XVIII. in 1814 gave liberty to the press in express terms, but restrictions soon followed. In 1819 a system of sureties (*cautionnements*) replaced the censorship. The Revolution of 1830 was caused by, *inter alia*, one of the ordinances of St Cloud (25th July 1830) for suspension of the liberty of the press. Restrictions on the liberty were removed for the time in 1830 and 1852, only to be succeeded as usual by the press laws of 1835 and 1852. During the second empire Government prosecutions for libel were used as a powerful engine against the press. The proceedings against Montalembert in 1858 are a well-known instance. Between 1858 and 1866 many newspapers were suppressed by proclamation. With the republic liberty of the press was completely re-established. A decree of 27th October 1870 submitted press offences to trial by jury.¹ The law of 29th July 1881, by which the French press is now regulated, begins by asserting the liberty of the press and of bookselling. The principal limitations of this liberty are the prohibition to publish criminal proceedings before hearing in public, or lists of subscriptions for indemnifying an accused person, and the power of forbidding the entrance of foreign newspapers under certain circumstances (see vol. xvii. p. 427). The order of responsibility for printed matter is (1) the manager or editor, (2) the author, (3) the printer, (4) the vendor or distributor. Proceedings for breaches of the law must be taken within three months. As to taxation, the decree of 5th September 1870 abolished the stamp duty upon newspapers, but it is still imposed upon public notices (*affiches*) other than those of public authorities. None but the notices of public authorities may be printed on white paper.
